some policy of isolated positions. It takes innumerable forms, according to the nature of the war—blockhouses, or guerilla posts, or what not. These new isolated concrete machine-gun positions are only a particular example of the general truth. There has never been a siege in history which at its close did not take the form of bastions still strongly held attempting to prevent the piercing of the increasingly weakly held curtain between them. There has never been a defeated defensive in history which in its last stages was not of its nature increasingly patchy. The advantage and disadvantage of such methods are quite obvious. The advantage is the power to hold, or to attempt to hold, the outer shell of the defensive zone with less men. The disadvantage is the lack of continuity in the defensive line. The pill boxes are not some wonderful new idea which gives a longer lease of life to the enemy than was expected. There is nothing unexpected or of genius in the construction of very thick low concrete protection for isolated machine-gun positions and the substitution of these for continuous trenches which can no longer be held or even kept in being under the perpetually increasing fire power of the British siege artillery. The only question put by this last method of the defensive was whether the lack of continuity in the defence which it presupposed would be compensated for by the strength of the isolated posts? That is the question which all siege devices present. The question has been solved in this case almost immediately in favour of the offensive, and we may confidently expect that the future will show what fruits the answer to that question gives us.

You cannot have your cake and eat it too. The moment you begin to rely upon small isolated posts you postpone in some degree your timing of counter-attack. You interfere with your power of lateral movement, and you create a front line which is more brittle than the old. Perhaps also, if we are to judge by reports, you lower your power of inflicting loss upon the attacking troops.

The Line of the Dvina

With regard to the line of the Dvina, what we have to say is unfortunately only too simple. It is lost.

The town of Dvinsk, or Dumaborg, is at the enemy's disposal, whenever he chooses to occupy it, and the whole of the defensive system of which the river Dvina was success-

fully made the nucleus during the past two terrible years of strain has gone to pieces.

Whenever you have an obstacle in warfare you hold beyond that obstacle (if you have any hope of ultimate success) what are called "bridgeheads," that is positions on the enemy's side beyond the obstacle the possession of which will allow you, when the time comes to advance, to cover the passages of the obstacle in your own favour. The Russians, in making the Dvina their defensive line in the north, held a continuous belt of bridgeheads from the gulf of Riga right upstream to the lake region in front of Dvinsk.

The Germans, during the whole of the last two years, and especially at the beginning of that period, made every effort to reduce this bridgehead belt. So long as the Russian political system and its army were intact they failed. In their efforts of the last few weeks they have completely succeeded. First they carried the bridgeheads immediately above Riga, turned the position of that town and occupied it.

Now in the past week they have driven in the bridgehead still further upstream, occupying Jacobstadt, and reaching the river as high up as Liwenhof. The line of the Dvina is gone.

The Russian Revolution and the French Revolution.

IN the course of the present war, historical parallels have constantly presented themselves to the public mind.

Where they have been very general and very distant, they have been, if applied with caution, and with due elimination of detail, serviceable.

For instance, the parallel between the present struggle and the second Punic war, though there are vast differences in scale, both of time and space, and in object, has furnished one great invaluable lesson, the lesson of tenacity. In the one case, as in the other, the party ultimately doomed to defeat enjoyed every preliminary success, invaded the territory of its opponent thoroughly, and only failed at last through the superior will and tenacity of the apparently conquered party.

There have been certain other historical parallels which have proved valuable, for instance, the parallels between (or the identity between) the Prussian neglect of international morals under Frederick the Great, with his invasion of Silesia, and the Prussian neglect of international morals to-day with its invasion of Belgium.

The parallels of the past, of blockade by sea, have also invariably held.

But there have been many more parallels drawn from the past which have been misleading; and more than misleading, highly dangerous from the fact that the secure and known history of the past has made men forecast the immediate future with a sort of certitude, as though they were following a map.

The worst of these, undoubtedly, has been the parallel from old wars of movement. It has misled the best brains and the most practised students of war in Europe. This was especially the case in the autumn of 1914. Then the new trench warfare unexpectedly developed upon its present enormous scale in the West.

There have been other of these false parallels, of which one of the most striking was the supposed parallel between the German invasion of Poland and the precedent of 1812. But the most dangerous at the present is undoubtedly the parallel between the Russian Revolution and the French creative movement of a hundred and thirty years ago, which transformed Europe. If we allow that parallel to dominate our thought,

we shall lose the war. It is misleading in the highest degree, and it misleads us precisely in those points where we most require discipline, tenacity and vision and makes us hope that of the Russian as the French, there will come in wisdom.

Let us first observe the superficial points of resemblance.

Both movements are an attack upon, and the successful oversetting of, a political monarchical machine. Both have for their motive power the discontent of a whole population, largely an economic discontent, and both use the same phrases with regard to political opinion, though the second is merely a copy of the first in this respect. In both movements there is an appeal to ideals floating in the general mind of Europe, and as yet, undeveloped. It is fair to add that both movements, regarded apart from their military aspect, have more in common than the opponents of the present Russian Government upheaval might be willing to grant.

But it is the military aspect which practically determines, because it is for us a matter of life and death, and when we come to that military aspect, the differences are fundamental.

To begin at the beginning. The French Revolution was undoubtedly in its origin, and even at its height, the movement of a whole people generally united and homogeneous. This truth has been defined by foreign observers and students as a whole, and by many native historians as well. It is true that the direction of the French Revolution was in the hands of a minority. It is true that the orderly process of direct and universal voting by plebiscite or referendum did not control it. But it is equally true that the nation as a whole had been thoroughly permeated before the revolution broke out with the ideals which that revolution set out to realise, and it is worthy of remark that, with the exception of western and highly localised rebellion in Vendée and Brittany every reaction against the revolution was effected in the name of the revolution and was an honest attempt to realise its creed. The Girondins would have defined themselves as the heirs and better representatives of the revolutionary creed than the Mountain. The Cæsaristic conclusion of the whole affair was thoroughly alive with its general tendencies, and the poet who called Napoleon Robespierre on horseback was talking sense.

Now the Russian Revolution has not such a united nation

to deal with, nor a clear national ideal supporting it. Its direction is in the hands of men whose ideals are essentially cosmopolitan, many of whom are not Russians at all, but have in the past proved their detestation of the Russian character and regarded themselves as the victims of that character. The material with which it deals is not one nation at all. The Russian Empire which it has overset was not one organised people, but an autocracy which united under its control elements the most diverse in speech, origin, social tradition and religion. The Finns are not Russians at all. South Russia has elements which we cannot judge in the west, but which are certainly separatist. The Cossacks are an element apart. The Poles were a distinct and separate entity, and the outlying territories to the south and to the east in the Caucasus and beyond, and in Asia, were no part at all of one united nation. The Jewish element, very powerful, very numerous, and in the main German-speaking, were something utterly distinct from, and usually hostile to those whom they now largely inspire and claim to order.

One Heart, One Brain

Again, France had in the revolution one heart and brain for its whole organism, which was Paris. Russia has no such centre. The town which claims to govern is the least national of all Russian towns. Paris is the most national of all the French towns. Some sort of parallel might be afforded by Moscow if Moscow had been the seat of the movement and the traditions of Moscow and the local native leaders of Moscow its inspiration. Petrograd can lay no such claim. On the contrary, its position is the very antithesis morally, geographically and politically, of a national capital. It is an extreme frontier town, gathering within it and intensifying every anti-national mood and itself the artificial creation—and the recent creation—of bureaucracy.

Again, the French Revolution set out with a definite object with a creed and documents supporting that claim. Its whole action was positive. You hate it or you love it, as you hate or you love an organised religion. In the Russian movement there is nothing of this. There is a chaos of conflicting negations. There is nothing upon which you can put your finger and say, "This is that clear doctrine for which these men have risen and for which they are willing to die."

But undoubtedly the sharpest contrast of all, and certainly the one which most practically concerns ourselves, is the military contrast, and here you have a contrast of north against south, of plus against minus.

The French Revolution was launched *before* the outbreak of war. The war which followed upon it was a war, the flaming motive of which was military success. The appeal was made to a military nation to resist an invader who had insolently proposed to dictate domestic policy. The whole revolution naturally turned into a war of propaganda and of conquest, and the very nature of the whole thing was bound to become military from the moment that, in Danton's prophecy, "the first bugles should sound."

The Russian Revolution broke out as a consequence of defeat. Its extremists were the opponents of war, and particularly of a war of national defence. It was bred in the distaste of, or the hatred for, the profession of arms, its intensity was marked progressively by the denunciation of the military spirit.

In France the chief architect of the revolution was Carnot, a professional soldier whose interest, let alone whose stoical ideals, were those of a soldier. Read the movements of the man before Wattignies, and see how the mere intellectual interest of tactics absorbed him. Note how the songs and the legends of the French Revolution are the songs and the legends of arms; and mark the passion for military order which precisely coincides with the most violent strain of 1794.

The Reign of Terror was essentially martial law. And if you consult the motives of its cruelty, and read in detail the indictments under which its victims suffered, you will find the overwhelming mass of them to be indictments against military treason or military slackness. Even apart from this military character of the Gallic race and of its chief modern effort you have the clear reasoning, the intellectual power which grasped from the earliest moment of the effort what should be for all of us to-day its chief lesson: *that a political ideal once challenged to battle by an opponent can only be realised by decisive victory in the field.*

The Russian Revolution does not show this character but its exact opposite. Its extremists are men who cry for peace, who tell us that the punishment of aggression is immoral, and who believe or say that an undefeated enemy who has already half crushed the army organisation will, if he is now propitiated, leave them for the future in peace.

The characteristic phrase of the French Revolution, rhetorical and borrowed from antiquity was this: "The Republic does not negotiate with an enemy upon the national soil." Of such a characteristic phrase the Russian Revolu-

tion gives us no echo. There is no defining principle capable of producing such an historical sentence. The nearest thing to it is the reproduction of a false and silly sentence, framed in Berlin, "No annexations and no indemnities." In other words, no victory.

It is a phrase not only of German origin, but accurately repeated for the most part by men whose own language in Petrograd is German. It is as though when Verdun had fallen in 1792 Danton had said: "No act of wicked violence against our friends the Emigrés and Brunswick." What he did say (and all France echoed him) was something very different. He said: "What we need is Daring and more Daring and ceaseless Daring." We have had no such signal from the east to-day, and we may wait long for it.

A less general examination will show another characteristic difference between the two movements, which is, after all, but the natural consequence of their profound spiritual diversity.

The French movement was wholly directed by men who were the very concentration of the French people; their essence as it were: that professional middle-class of the eighteenth century which has been reproached for the spirit of the Jacobins, whose limited views upon liberty and property have been the jest of their opponents, whose culture has been thought too narrow—but who changed the world.

Every one of the leading men in the French Revolution is the man trained in the traditions of the French University and in the spirit of the French bourgeoisie. It was the lawyers, the officers of the learned arms, sappers and gunners, the young poets and the young scholars, the local magnates of the towns, who made the thing, who directed it, and who conquered Europe. The modern European society which they erected has been made in their image, it has failed where they lacked breadth and magnificence, it has succeeded where the strong virtues of their class were needed. They were the spokesmen and the captains of the whole affair. Napoleon himself was of them. Rousseau had been of them. Robespierre, Carnot, St. Just, Danton, the mad Marat—every name you can choose was of them.

There is nothing corresponding to this at all in the Russian movement. Whether such a class exists in Russia may be doubted. That it has come to control the revolution, if it does exist, can certainly be denied.

Now it is unfortunately probable that without some such homogeneous class direction a movement of this kind can neither progress nor succeed.

Lastly, you have the simple truth that the nation of France at the French Revolution, through the volunteers and through the less articulate action of the peasants, joined the general scheme. It was fairly articulate, it was upon the whole united, it went forward towards a common end, and that end you may see around you in Western Europe to-day. *But of what the mass of the Russian peasantry may think or wish to do to-day we hear nothing.* The revolution in France took arms and conquered *after* the national federation. Of such national federation, nay, of so much as a national convention, we have heard nothing in Russia but promises—though six months have passed. We simply do not know what the nation, that interior Russian mass lying centrally among so many other different peoples, the Muscovy peasantry which is properly described as Russian, thinks or feels upon the whole affair. It has not spoken, and as yet no steps have been taken by which it may be permitted to speak.

H. BELLOC.

It is too often regarded in this country that inasmuch as Germany has introduced the ration ticket system, everything works smoothly in that country under the Food Controller. But this extract from the *Vossische Zeitung* of Berlin which appeared only last week, gives a very different view:

"Everyone in Berlin buys on the sly what he can—noble, post-office official, shopgirl, merchant, workman, and officer. The usually moral man sees and hears with remarkable light-mindedness, the humorous tales regarding the persistent manner in which all classes ignore the law—as, for example, the wild prices which workmen, themselves receiving the wildest wages, pay in Spandau for illegally imported food, etc. Even if one were to let loose that dangerous expedient—general information against everyone—where can we find the prisons to hold the millions who will be convicted? Under such circumstances someone will always ask if it is not better to do away with this entire system of penalty and compulsion, which is directed, not against the minority, but against the majority. A return to free trading without conditions or limitations has been many times demanded. That is impossible. The simplest expedient of going back to the peace basis when the industrial situation is so thoroughly abnormal would have the most dangerous consequences. Whether a vital change in our war industrial organisation is either possible or advisable in the present state of high war tension is a question which can only be decided by a conference of experts. It must also be remembered that when peace negotiations or an armistice begin it will be impossible to change matters even then."

General Pershing: The Man and His Work

By Lewis R. Freeman

DURING a recent sojourn in France I heard, in the course of a single day, two very illuminative comments on the officers of the newly arrived American Expeditionary Force. The first was by a young French Staff Officer whom I met while on a visit to the Champagne front.

"We like your officers immensely," he said, "they are so quick-witted and so energetic, and yet so easy to get along with. But do you know they have been of a great surprise to us in that they are not in the least 'American'; they are always asking us what we think of things, not telling us what they think."

"But isn't that just as it should be," I said, "considering that you have had three years of experience of modern warfare and they haven't had any at all?"

"Of course it's as it should be," he replied; "but—well, to be frank, it isn't quite what we expected. You Americans have such a manner of working out ways of your own to do things that—well, naturally, we rather expected to hear more of how you were going to do it."

Returning to Paris that afternoon, I dined in the evening with an American friend who was in France on a special diplomatic mission, and it was while discussing the complicated task of the Staff of the American Expeditionary Force in France that he said:

"It isn't only a military liaison with the Allied armies that has to be effected, but also a sort of a social liaison with the Allied peoples—the French and the English. This being so, we may count ourselves fortunate that the job is up to our old Regular Army Officers. Our little Regular Army—with the Navy, of course—was, up to the time of our entry into the war, about the only really national thing we had. Just about everything else was coloured with sectionalism, provincialism; and for that reason I have always held that our Regular Army Officers were not necessarily the most typical, but certainly the most characteristically 'American' citizens of the country. And this is especially true of those officers who saw service in the Philippines, for their Americanism has been strengthened by a 'national perspective' that can only be acquired by a considerable residence outside one's country, by 'standing off' so to speak, and viewing it objectively."

"General Pershing," he concluded, "is one of the most—indeed, perhaps the most—'American' American I know; and, because in the first year of his work over here, he is 'establishing contact' in so many senses besides the military, I cannot conceive of a man whom it would be more desirable that our Allies should judge us by, or through whom they should learn of the spirit we bring to our task and of the spirit in which we hope to carry it through."

Because the average European's idea of the American is of a sort of a cross between a Cook's tourist and a patent medicine salesman, one can hardly blame him for having had some misgivings how things would go when he had this bumptious hybrid beside him as an Ally. As the remarks of the young French Officer I have quoted would indicate, there has been "a great surprise" that in the place of this popularly conceived American, there has appeared a modest but apparently competent individual, who shows an astonishing readiness to defer to the experience of others, and an equally astonishing reluctance to try to make others defer to his. What is happening is that England and France are just beginning to make the acquaintance of a, to them, new type of American, a type which, one may venture to hope, will become sufficiently familiar to them in the months to come to give it at least a sporting chance of supplanting the "Cook's-tourist-patent-medicine-salesman" type in the popular imagination.

With my diplomatic friend I have quoted, I, who am myself an American, feel that America is indeed fortunate that our Regular Army Officer, of whom General Pershing is so distinguished, yet so thoroughly representative, should be the principal medium through which our first forerunning "national liaison" with our European Allies is effected.

* * * * *

I have heard and read many descriptions and characterisations of Major General John J. Pershing, but I think none that ever impressed me as being quite so succinctly comprehensive in indicating the traits that make the man's record what it is as the words of a Moro chief of the island of Jolo, who had met the then Military Governor of Mindanao both on the battlefield and at the council table. Defeat on the one side had won his respect, justice on the other his gratitude, and at the moment I encountered him he had

come to the office of the acting Governor of Jolo to give information regarding a threatened rising among the Moros. When I told him that I had recently seen General Pershing in Zamboanga, he nodded his head vigorously, showed his betel-nut stained teeth in an affectionate grin and remarked, "Pershin' he lick you, but he no lie to you." That was all he said, but I have recently read magazine articles (of more pages than that old bare-footed chief used words) which failed to reveal so well what were the mainsprings of General Pershing's success at tasks which had proved too much for other men. He never made a promise which he could not and would not keep, and if fair dealing did not accomplish the desired result he effected it by fair fighting. Truth and a good licking go farther with the primitive savage than with his civilised brother, and the outstanding success that has crowned American effort to rule the high-spirited non-Christian races of the Southern Philippines is traceable largely to the rare judgment with which the one supplemented the other during the Pershing regime.

Up to the time of his entry into the Philippine field, where his most distinguished work to date has been accomplished, Pershing's career had not a great deal to differentiate it from any other American Regular Army Officer of similar rank. He graduated from West Point in 1886, and almost immediately rode with the 10th Cavalry in Crook's campaign against the Apaches in Arizona and Mexico, a somewhat similar operation to the one against Villa, in which he was destined to have the chief command thirty years later. In 1890 he took part in the campaign against "Sitting Bull," in the "Bad Lands" of Dakota, doing notable work at the head of a band of loyal Sioux Scouts.

The next eight years were "routine," but in 1898 there began for Pershing a period of military activity which has had but the briefest breaks down to the present. He fought and gained mention for bravery at San Juan and El Caney in the operations culminating in the fall of Santiago de Cuba, and after the Philippines were ceded by Spain to the United States, he was sent with his regiment to take part in the infinitely difficult series of campaigns for their final pacification. It was the sheer brilliancy of his work against the fanatical Moros of the big southern island of Mindanao which was responsible several years later for his unparalleled promotion, over the heads of 862 officers who normally would have had precedence of him—from Captain to Brigadier-General. The truth was that there was work waiting for Pershing, but before taking it up it was imperative that he be elevated to a higher rank, because departmental red-tape made it impossible for President Roosevelt to promote him to Major or Colonel, he, with characteristic disregard of precedent, made him a General.

The work which awaited Pershing was to complete the pacification of Mindanao and to initiate a suitable form of government for that turbulent island, a task at which the several distinguished Generals who preceded him had had but indifferent success. How the miracle was wrought is too long a story to tell here. Fair-dealing and fair-fighting, as I have said, went hand in hand, and no penalty went uninflicted, no promised reward unfulfilled.

Concurrently with the military campaign a comprehensive programme for improving the health and economic welfare of the pacified population was carried on. Roads were built, agricultural stations established, and schools—both elementary and for simple industrial training—started. The deadly foe of one day became the peaceful coconut-planter or basket-weaver of the next. General Pershing's great task was practically completed by the time he was recalled to America shortly before the outbreak of the present war.

The task set General Pershing in sending him into Mexico after the elusive Pancho Villa last year might well be compared to sending a man into a cage of hyenas with orders to bring out one of them without interfering with the others. That Pershing succeeded in doing this without bringing America into actual war with Carranza (and thus playing the German game) is by many rated as the most superlatively finessed achievement of its kind in American military history, one which made his choice to command the American Expeditionary Force in France inevitable.

* * * * *

If one thing more than another impressed me in the all-too-brief chat I had with General Pershing in Paris a fortnight ago, it was the grim earnestness with which he is putting his shoulder to his latest and greatest task; that, and an almost reverent admiration for the armies that had stood the first shock, the men who had blazed the way before him.

The Last Hours of Edith Cavell

By Hugh Gibson (First Secretary of the American Legation in Brussels)

Another Chapter from

A Journal from a Legation

Owing to the temporary illness of Mr. Whitlock, American Minister in Brussels, who was in charge of British interests in Belgium, it fell to the duty of Mr. Hugh Gibson to undertake to save the life of Miss Edith Cavell, who, as this narrative shows, had been denied justice by the German Military Court. The facts were written down at the time, and Raemackers' famous cartoon, published on the occasion and reproduced by us to-day, is another record. It is not to be assumed that because at the last moment the German authorities in Brussels refused to apply personally to the Kaiser for a reprieve, that the Kaiser was not in sympathy with the crime. He has never repudiated it; he has defended it.

ON AUGUST 5, 1915, Miss Edith Cavell, an English woman, directress of a large nursing home at Brussels, was quietly arrested by the German authorities and confined in the prison of St.-Gilles on the charge that she had aided stragglers from the Allied armies to escape across the frontier from Belgium to Holland, furnishing them with money, clothing and information concerning the route to be followed. It was some time before the news of Miss Cavell's arrest was received by the American Legation, which was entrusted with the protection of British interests in the occupied portion of Belgium. On August 31st the Minister at Brussels received a communication from the Ambassador in London transmitting a note from the Foreign Office, stating that Miss Cavell was reported to have been arrested and asking that steps be taken to render her assistance. Mr. Whitlock immediately addressed a note to the German authorities asking whether there was any truth in the report of Miss Cavell's arrest, and requesting authorization for Maitre Gaston de Leval, the Legal Counselor of the Legation, to consult with Miss Cavell and, if desirable, entrust some one with her defence.

No reply was received to this communication, and on September 10th the Legation addressed a further note to Baron von der Lancken, Chief of the Political Department, calling his attention to the matter and asking that Baron von der Lancken enable the Legation to take such steps as might be necessary for Miss Cavell's defence. On September 12th a reply was received from Baron von der Lancken in which it was stated that Miss Cavell had been arrested on August 5th and was still in the military prison of St.-Gilles. The note continued:

She has herself admitted that she concealed in her house French and English soldiers, as well as Belgians of military age, all desirous of proceeding to the front. She has also admitted having furnished these soldiers with the money necessary for their journey to France, and having facilitated their departure from Belgium by providing them with guides, who enabled them to cross the Dutch frontier secretly.

Miss Cavell's defence is in the hands of the advocate Braun, who, I may add, is already in touch with the competent German authorities.

In view of the fact that the Department of the Governor-General as a matter of principle does not allow accused persons to have any interviews whatever, I much regret my inability to procure for M. de Leval permission to visit Miss Cavell as long as she is in solitary confinement.

International Law

Under the provisions of international law the American Minister could take no action while the case was before the courts. It is an elementary rule that the forms of a trial must be gone through without interference from any source. If, when the sentence has been rendered it appears that there has been a denial of justice, the case may be taken up diplomatically with a view to securing real justice. Thus, in the early stages of the case the American Minister was helpless to interfere. All that he could do while the case was before the courts was to watch the procedure carefully and be prepared with a full knowledge of the facts to see that a fair trial was granted.

Maitre de Leval communicated with M. Braun, who said that he had been prevented from pleading before the court on behalf of Miss Cavell, but had asked his friend and colleague, M. Kirschen, to take up the case. Maitre de Leval then communicated with M. Kirschen, and learned from him that lawyers defending prisoners before German military

courts were not allowed to see their clients before the trial and were shown none of the documents of the prosecution. It was thus manifestly impossible to prepare any defence save in the presence of the court and during the progress of the trial. Maitre de Leval, who from the beginning to the end of the case showed a most serious and chivalrous concern for the welfare of the accused, then told M. Kirschen that he would endeavour to be present at the trial in order to watch the case. M. Kirschen dissuaded him from attending the trial on the ground that it would only serve to harm Miss Cavell rather than help her; that the judges would resent the presence of a representative of the American Legation. Although it seems unbelievable that any man of judicial mind would resent the presence of another bent solely on watching the course of justice, M. Kirschen's advice was confirmed by other Belgian lawyers who had defended prisoners before the German military courts, and spoke with the authority of experience. M. Kirschen promised, however, to keep Maitre de Leval fully posted as to all the developments of the case and the facts brought out in the course of the trial.

The trial began on Thursday, October 7th, and ended the following day.

On Sunday afternoon the Legation learned from persons who had been present at the trial some of the facts

The Case Against Miss Cavell

It seems that Miss Cavell was prosecuted for having helped English and French soldiers, as well as Belgian young men, to cross the frontier into Holland in order that they might get over to England. She had made a signed statement admitting the truth of these charges and had further made public acknowledgment in court. She frankly admitted that not only had she helped the soldiers to cross the frontier, but that some of them had written her from England thanking her for her assistance. This last admission made the case more serious for her, because if it had been proven only that she had helped men to cross the frontier into Holland she could only have been sentenced for a violation of the passport regulations, and not for the "crime" of assisting soldiers to reach a country at war with Germany.

Miss Cavell was tried under paragraph 58^a of the German Military Code, which says:

Any person who, with the intention of aiding the hostile power or causing harm to German or allied troops, is guilty of one of the crimes of Paragraph 90 of the German Penal Code, will be sentenced to death for treason.

The "crime" referred to by paragraph 90 was that of "conducting soldiers to the enemy" (namely, *dem Feinde Mannschaften zuführt*.)

It is manifest that this was a strained reading of the provisions of military law; that a false interpretation was wilfully put upon these provisions in order to secure a conviction. The law was obviously framed to cover the cases of those who assist stragglers or soldiers who have become lost to get back to their own lines and join their units. It is doubtful whether framers of the military law had foreseen anything so indirect and unprecedented as that of helping soldiers cross the frontier into a neutral country in the hope that they might subsequently find their way back to their own army. Miss Cavell assisted these soldiers to escape into a neutral country which was bound, if possible, to apprehend and intern them. If these soldiers succeeded in outwitting the watch authorities and making their way to England, their offence would not, to any fair-minded person, increase the offence committed by Miss Cavell.

Her Courage in Court

Miss Cavell's conduct before the Court was marked by the greatest frankness and courage. She stated that she had assisted these men to escape into Holland because she thought that if she had not done so they would have been seized and shot by the Germans; that she felt that she had only done her duty in helping to save their lives.

The Military Prosecutor replied that while this argument might be made concerning English soldiers, it could not apply to Belgians who were free to remain in the country without danger. The subsequent behaviour of the German authorities to the Belgian young men who remained in the country does not lend any considerable weight to the remarks of the Public Prosecutor.

In concluding his plea, the Public Prosecutor asked that the

court pass the sentence of death upon Miss Cavell and eight other prisoners among the thirty-five brought to trial.

Upon ascertaining these facts Maître de Leval called at the Political Department and asked that, the trial having taken place, permission be granted him to see Miss Cavell in person as there could be no further objection to consultation. Herr Conrad, an official of the Political Department, who received Maître de Leval, stated that he would make enquiry of the court and communicate with him later.

The foregoing are the developments up to Sunday night, October 10th. Subsequent developments are shown by the following extracts from a journal made at the time.

Extracts from My Journal

Brussels, October 12th, 1915.—When I came in yesterday morning I found information which seemed to confirm previous reports, that Miss Cavell's trial had been concluded on Saturday afternoon and that the prosecution had asked that the death sentence be imposed. Monsieur de Leval promptly called up the Political Department on the telephone and talked to Conrad, repeating our previous requests that he be authorised to see Miss Cavell in prison. He also asked that Mr. Gahan, the English chaplain, be permitted to visit her. Conrad replied that it had been decided that Mr. Gahan could not see her, but that she could see any of the three Protestant clergymen (Germans) attached to the prison; that de Leval could not see her until the judgment was pronounced and signed. He said that as yet no sentence had been pronounced and that there would probably be a delay of a day or two before a decision was reached. He stated that even if the judgment of the Court had been given it would have no effect until it had been confirmed by the Governor, who was absent from Brussels and would not return for two or possibly three days. We asked Conrad to inform the Legation immediately upon the confirmation of the sentence in order that steps might be taken to secure a pardon if the judgment really proved to be one of capital punishment. Conrad said that he had no information to the effect that the Court had acceded to the request for the death sentence, but promised to keep us informed.

Germans' Lying Promise

Despite the promise of the German authorities to keep us fully posted, we were nervous and apprehensive; and remained at the Legation all day, making repeated enquiry by telephone to learn whether a decision had been reached. On each of these occasions the Political Department renewed the assurance that we would be informed as soon as there was any news. In order to be prepared for every eventuality, we drew up a petition for clemency addressed to the Governor-General, and a covering note addressed to Baron von der Lancken in order that they might be presented without loss of time in case of urgent need.

A number of people had been arrested and tried for the offence of helping men to cross the frontier to Holland, but the death sentence had never been inflicted. The usual thing was to give a sentence of imprisonment in Germany. The officials at the Political Department professed to be sceptical as to the reported intention of the Court to inflict the death sentence, and led us to think that nothing of the sort need be apprehended.

None the less we were haunted by a feeling of impending horror that we could not shake off. I had planned to ride in the afternoon, but when my horse was brought around I had it sent away and stayed near the telephone. Late in the afternoon Leval succeeded in getting into communication with a lawyer interested in one of the accused. He said that the German Kommandantur had informed him that judgment would be passed the next morning, Tuesday. He was worried as to what was in store for the prisoners and said he feared the Court would be very severe.

At 6.20 I had Topping (clerk of the Legation) telephone Conrad again. Once more we had the most definite assurances that nothing had happened, and a somewhat weary renewal of the promise that we should have immediate information when sentence was pronounced.*

At 8.30 I had just gone home when Leval came for me in my car, saying that he had come to report that Miss Cavell was to be shot in the course of the night. We could hardly credit this; but as our informant was so positive and insisted so earnestly, we set off to see what could be done.

Leval had already seen the Minister, who was ill in bed, and brought me his instructions to find von der Lancken, present the appeal for clemency and press for a favourable decision. In order to add weight to our representations I was

to seek out the Spanish Minister to get him to go with us and join in our appeal. I found him dining at Baron Lambert's, and on explaining the case to him he willingly agreed to come.

How Lancken Spent the Evening

When we get to the Political Department we found that Baron von der Lancken and all the members of his staff had gone out to spend the evening at one of the disreputable little theatres that have sprung up here for the entertainment of the Germans. At first I was unable to find where he had gone, as the orderly on duty evidently had orders not to tell, but by dint of some blustering and impressing on him the fact that Lancken would have cause to regret not having seen us, he agreed to have him notified. I put the orderly into the motor and sent him off. The Marquis de Villalobar, Leval and I settled down to wait, and we waited long, for Lancken, evidently knowing the purpose of our visit, declined to budge until the end of an act that seemed to appeal to him particularly. He came in about 10.30, followed shortly by Count Harrach and Baron von Falkenhausen, members of his staff.

I briefly explained the situation as we understood it and presented the note from the Minister transmitting the appeal for clemency. Lancken read the note aloud in our presence, showing no feeling aside from cynical annoyance at something—probably our having discovered the intentions of the German authorities.

When he had finished reading the note Lancken said that he knew nothing of the case, but was sure in any event that no sentence would be executed so soon as we had said. He manifested some surprise, not to say annoyance, that we should give credence to any report in regard to the case which did not come from his Department, that being the only official channel. Leval and I insisted, however, that we had reason to believe our reports were correct and urged him to make inquiries. He then tried to find out the exact source of our information, and became painfully insistent. I did not propose however, to enlighten him on this point and said that I did not feel at liberty to divulge our source of information.

Lancken then became persuasive—said that it was most improbable that any sentence had been pronounced; that even if it had, it could not be put into effect within so short a time, and that in any event all Government Offices were closed and that it was impossible for him to take any action before morning. He suggested that we all go home "reasonably," sleep quietly and come back in the morning to talk about the case. It was very clear that if the facts were as we believed them to be, the next morning would be too late; and we pressed for immediate inquiry. I had to be rather insistent on this point, and de Leval, in his anxiety, became so emphatic that I feared he might bring down the wrath of the Germans on his own head and tried to quiet him. There was something splendid about the way Leval, a Belgian subject with nothing to gain and everything to lose, stood up for what he believed to be right and chivalrous, regardless of consequences.

Finally, Lancken agreed to enquire as to the facts, telephoned from his office to the presiding judge of the court-martial, and returned in a short time to say that sentence had indeed been passed, and that Miss Cavell was to be shot during the night.

Plea for Clemency

We then presented with all the earnestness at our command the plea for clemency.

We pointed out to Lancken that Miss Cavell's offences were a matter of the past; that she herself had been in prison for some weeks, thus effectually ending her power for harm; that there was nothing to be gained by shooting her, and on the contrary this would do Germany much more harm than good and England much more good than harm. We pointed out to him that the whole case was a very bad one from Germany's point of view; that the sentence of death had heretofore been imposed only for cases of espionage and that Miss Cavell was not even accused by the German authorities of anything so serious. *We reminded him that Miss Cavell as directress of a large nursing home had since the beginning of the war cared for large numbers of German soldiers in a way that should make her life sacred to them.* I further called his attention to the manifest failure of the Political Department to comply with its repeated promises to keep us informed as to the progress of the trial and the passing of the sentence. The deliberate policy of subterfuge and prevarication by which they had sought to deceive us as to the progress of the case was so raw as to require little comment. We all pointed out to Lancken the horror of shooting a woman, no matter what her offence; and endeavoured to impress upon him the frightful effect that such an execution would

*This was just one hour and twenty minutes after the sentence had actually been pronounced. There is no need for comment.

have throughout the civilized world. With an ill-concealed sneer he replied that on the contrary he was confident that the effect would be excellent.

When everything else had failed we asked Lancken to look at the case from the point of view solely of German interests, assuring him that the execution of Miss Cavell would do Germany infinite harm. We reminded him of the burning of Louvain and the sinking of the *Lusitania*, and told him that this murder would stir all civilized countries with horror and disgust. Count Harrach broke in at this with the rather irrelevant remark that he would rather see Miss Cavell shot than have harm come to the humblest German soldier, and his only regret was that they had not "three or four English old women to shoot."

Appeals to Kaiser Refused

The Spanish Minister and I tried to prevail upon Lancken to call Great Headquarters at Charleville on the telephone and have the case laid before the Emperor for his decision. Lancken stiffened perceptibly at this suggestion and refused, frankly—saying that he could not do anything of the sort. Turning to Villalobar, he said, "I can't do that sort of thing. I am not a friend of my sovereign as you are of yours," to which a rejoinder was made that in order to be a good friend one must be loyal and ready to incur displeasure in case of need. However, our arguments along this line came to nothing, but Lancken finally came to the point of saying that the Military Governor of Brussels was the supreme authority (*Gerichtsherr*) in matters of this sort and that even the Governor-General had no power to intervene. After further argument he agreed to get General von Sauberschwieg, the Military Governor, out of bed to learn whether he had already ratified the sentence and whether there was any chance for clemency.

Lancken was gone about half an hour, during which time the three of us laboured with Harrach and Falkenhausen, without, I am sorry to say, the slightest success. When Lancken returned he reported that the Military Governor said that he had acted in this case only after mature deliberation; that the circumstances of Miss Cavell's offence were of such character that he considered infliction of the death penalty imperative. Lancken further explained that under the provisions of the German Military Law the *Gerichtsherr* had discretionary power to accept or to refuse an appeal for clemency; that in this case the Governor regretted that he must decline to accept the appeal for clemency or any representations in regard to the matter.

We then brought up again the question of having the Emperor called on the telephone, but Lancken replied very definitely that the matter had gone too far; that the sentence had been ratified by the Military Governor, and that when matters had gone that far "even the Emperor himself could not intervene."*

He then asked me to take back the note I had presented to him. I at first demurred, pointing out that this was not an appeal for clemency, but merely a note to him transmitting a note to the Governor which was itself to be considered the appeal for clemency. I pointed out that this was especially stated in the Minister's note to him, and tried to prevail upon him to keep it. He was very insistent, however, and inasmuch as he had already read the note aloud to us and we knew that he was aware of its contents, it seemed that there was nothing to be gained by refusing to accept the note, and I accordingly took it back.

The Last Hopeless Plea

Despite Lancken's very positive statements as to the futility of our errand, we continued to appeal to every sentiment to secure delay and time for reconsideration of the case. The Spanish Minister led Lancken aside and said some things to him that he would have hesitated to say in the presence of Harrach, Falkenhausen and Leval. Lancken squirmed and blustered by turns, but stuck to his refusal. While this conversation was going on, I went after Harrach and Falkenhausen again. This time, throwing modesty to the winds, I reminded him of some of the things we had done for German interests at the outbreak of the war; how we had repatriated thousands of German subjects and cared for their interests; how during the siege of Antwerp I had repeatedly crossed the lines during actual fighting at the request of Field Marshal von der Goltz to look after German interests; how all this service had been rendered gladly and without thought of reward; that since the beginning of the war we had never asked a favour of the German authorities, and it seemed in-

credible that they should now decline to grant us even a day's delay to discuss the case of a poor woman who was, by her imprisonment, prevented from doing further harm, and whose execution in the middle of the night at the conclusion of a course of trickery and deception was nothing short of an affront to civilization. Even when I was ready to abandon all hope, Leval was unable to believe that the German authorities would persist in their decision, and appealed most touchingly and feelingly to the sense of pity for which we looked in vain.

Our efforts were perfectly useless, however, as the three men with whom we had to deal were so completely callous and indifferent that they were in no way moved by anything that we could say.

We did not stop until after midnight, when it was only too clear that there was no hope.

It was a bitter business leaving the place feeling that we had failed and that the little woman was to be led out before a firing squad within a few hours. But it was worse to go back to the Legation to the little group of English women who were waiting in my office to learn the result of our visit. They had been there for nearly four hours, while Mrs. Whitlock and Miss Larner sat with them and tried to sustain them through the hours of waiting. There were Mrs. Gahan, wife of the English chaplain, Miss B. and several nurses from Miss Cavell's school. One was a little wisp of a thing who had been mothered by Miss Cavell, and was nearly beside herself with grief. There was no way of breaking the news to them gently, for they could read the answer in our faces when we came in. All we could do was to give them each a stiff drink of sherry and send them home. Leval was as white as death, and I took him back to his house. I had a splitting headache myself and could not face the idea of going to bed. I went home and read for awhile, but that was no good, so I went out and walked the streets, much to the annoyance of German patrols. I rang the bells of several houses in a desperate desire to talk to somebody, but could not find a soul—only sleepy and disgruntled servants. It was a night I should not like to go through again, but it wore through somehow and I braced up with a cold bath and went to the Legation for the day's work.

Miss Cavell's Brave Death

The day brought forth another loathsome fact in connection with the case. *It seems the sentence on Miss Cavell was not pronounced in open court.* Her executioners, apparently in the hope of concealing their intentions from us, went into her cell and there, behind locked doors, pronounced sentence upon her. It is all of a piece with the other things they have done.

Last night Mr. Gahan got a pass and was admitted to see Miss Cavell shortly before she was taken out and shot. He said she was calm and prepared, and faced the ordeal without a tremor. She was a tiny thing that looked as though she could be blown away with a breath, but had a great spirit. She told Mr. Gahan that soldiers had come to her and asked to be helped to the frontier; that knowing the risks they ran and the risks she took she had helped them. She said she had nothing to regret, no complaint to make; and that if she had it all to do over again she would change nothing.

They partook together of the Holy Communion, and she who had so little need for preparation was prepared for death. She was free from resentment and said:

"I realise that patriotism is not enough. I must have no hatred or bitterness towards anyone."

She was taken out and shot before day-break.

She was denied the support of her own clergyman at the end; but a German military chaplain stayed with her and gave her burial within the precincts of the prison. He did not conceal his admiration and said: "She was courageous to the end. She professed her Christian faith and said that she was glad to die for her country. She died like a hero."

The Stars

By EDEN PHILLIPS

Did each white star that shines upon the clear
Of Night's untroubled forehead, like a gem
Glittering within her far-flung diadem,
Melt to the lustre of a fallen tear
Through all high heaven, enough would not be shed
To dedicate one drop to each man dead.

More tears than there are stars have yet to fall;
More hearts than there are stars have yet to break
For sacred Liberty's immortal sake,
At Freedom's high and universal call.
Oh, seed of heroes, watered with our tears,
Thine the sure harvest of these bitter years.

*Although accepted at the time as true this statement was later found to be entirely false and is understood to have displeased the Emperor. The Emperor could have stopped the execution at any moment.

The Two Presidents: Poincaré and Painlevé

By J. Coudurier de Chassigne

THE situation in France is anything but clear, even to Frenchmen used to the intricacies of French politics. I sometimes wonder how English people understand as well as they do, the swing of the political pendulum in my country. Perhaps under the present circumstances it may interest them to take a peep behind the scenes at the complex mechanism of our constitutional machine.

First let me remind my readers of the important part played by the President of the Republic during a Ministerial crisis, in time of peace as well as in war. The President is not, as many imagine, a mere decorative figure placed at the head of the State to register the decisions of Ministers or of Parliament. His duty is not only to agree to what they decide, and to put his signature to the most important measures, laws and decrees, though, of course, this secondary part of his functions takes up a great deal of his time. But, before everything, the President embodies the permanency of the Executive Power. He it is who really has his hand on the helm of the good ship he has to steer through calm as well as through stormy political weather.

When a Ministry resigns, he remains in power. The ex-Ministers simply carry on the every day business till their successors are appointed, but meanwhile, Parliament is only represented in the Executive by the President of the Republic.

He it is who has to send for the politician whom he is going to entrust with the task of forming the new Ministry.

It is true that the Head of the State always consults the Presidents of the Senate and of the Chamber of Deputies, and generally takes action after having come to an understanding with them. But there is nothing to prevent his making up his own mind and taking a decision contrary to the advice offered by the Presidents of the two Legislative Assemblies.

This formality over, the President of the Republic then summons to the Elysée the politician who for various reasons seems most likely to be acceptable to the majority of the two Chambers. He is not, however, invariably able to gauge correctly the sentiments of Parliament. Only a few months before the war, M. Poincaré asked M. Ribot to take the reins of Government, with the result that three days after he had accepted the task, he was roughly dismissed by the Chamber of Deputies at the very first sitting. Of course such a thing would be impossible in England on account of the Party system. In French politics, however, parliamentary majorities are not made up of parties but of group combinations. It is therefore perfectly possible that a majority should suddenly withdraw its confidence in a Prime Minister and still, after a very slight shuffling of groups, be prepared to accept as his successor another star of the same political colour. Under these circumstances the task of the President of the Republic requires tact, perfect knowledge of currents and sub-currents, as well as great strength of character in crises.

Forming a Cabinet

An example of this occurred only the other day when M. Poincaré called upon M. Ribot to form a Cabinet, and the latter felt himself obliged to decline the honour, not because the Socialists refused to join hands with him, but because M. Painlevé declined to enter a Ministry which did not contain representatives of the Socialist Party. M. Poincaré then turned to M. Painlevé, who agreed to try his luck with the help of the Socialists, but he too failed to achieve his object and proffered his resignation. But the President of the Republic, who evidently did not think the moment propitious for a Socialist government, insisted on M. Painlevé continuing his negotiations without the help of the Socialists. The consequence was the formation of a Ministry very similar to that in which he had refused to serve under M. Ribot. And to-day the Painlevé-Ribot Ministry—for M. Ribot remained in it as Minister of Foreign Affairs—reminds one of the situation created two years ago when a Briand-Viviani Cabinet succeeded a Viviani-Briand Ministry.

In short, as long as the French Parliament remains a congregation of small groups, the formation of a Ministry is more a question of persons than of principle. It is therefore easy to understand that the President of the Republic—who is the maker of the Cabinet—plays through the Président du Conseil (who is known in England, as Prime Minister) a most active part in all political evolutions, not only as the executor of the will of the Parliament, but also as the powerful instigator of all political changes.

When a Ministry has received the approbation of the two Chambers, the rôle of the President of the Republic is far from ended. He it is who presides at the sittings of the Cabinet—that is at all the important sittings. Now and then

Ministers may meet to discuss under the Chairmanship of the Président du Conseil questions of secondary import. But whenever there is to be what we might call a Grand Council, where vital decisions are to be taken, the members of the Cabinet assemble at the Elysée under the presidency of M. Poincaré. On these occasions he does not sit at the head of the long green table, facing the Président du Conseil, simply to hear what the Ministers have to say. He takes on the contrary his full share in the discussion, sums up the delicate points and plays very much more the part of an English Prime Minister than the Président du Conseil himself, (who in English newspapers is always referred to as the Prime Minister). Without making a further study of the powers which the constitution confers upon the Head of the State, I have said enough to show that he possesses the means of making his influence felt in all decisions taken by the Prime Minister whom he has himself chosen.

Definite Limitations

There are however very definite limitations to his powers, especially when the President happens to be a man of such high moral standing as Poincaré. It has been my privilege to have long private talks with him on matters relating to Home and Foreign Affairs, and that up to a few months before the outbreak of war. What struck me most in these conversations was the extraordinarily impartial attitude of a man who, possessed, as no other, profound knowledge of all political subjects. Here and there it was easy to see, when he analysed the situation, where his personal preferences would have led him had he been an ordinary citizen. For the chief among M. Poincaré's great qualities are his perfect frankness, his innate honesty, and his sound judgment which enables him to see things exactly as they are. But he is not a mere Member of Parliament, free to follow whatever course he deems wisest, even when the interests of his country are at stake. He is before everything the elect of Parliament and the faithful servant of the French Constitution as it is, not as it might be. Though his quick legal mind realizes to an iota all the imperfections inseparable from any human system, the President of the Republic has not, as his real duty, to modify the laws of France, but to see that they are carried out to the best advantage. He is in fact the guardian of the Constitution, though he possesses the power to dissolve the Chamber of Deputies, with the consent of the Senate, and appeal to the people if in a moment of great emergency he disagrees with Parliament on an issue vital to the country. Such a situation has, however, only once occurred in the history of the third Republic, and it was fatal to Marshal McMahon who then occupied the Presidential Chair.

I cannot conceive the possibility of M. Poincaré's taking any revolutionary step of that nature, and I am convinced that he would rather sacrifice his life than do violence—not to the letter—but even to the spirit of the law. Whether this extreme respect for the constitution is a good characteristic in a war-time President, must be left to the judgment of the future.

M. Poincaré's recent reference to the Almereyda scandal is an admirable illustration of the restrictions imposed upon his office. As long as a Président du Conseil is in power, he and his colleagues alone are responsible for the government of the country. The President of the Republic can therefore only express publicly in a vague and general way his personal desires and opinions regarding the policy of the Ministry.

M. Ribot trusted M. Malvy, who was answerable for the too lenient attitude of the police towards Almereyda and his associates. Under pressure of public opinion, M. Ribot was obliged to part company with his Minister of the Interior, and that long delayed separation finally brought about the fall of M. Ribot's government. This gave M. Poincaré his constitutional opportunity of stating what the policy of the next government should be in the interests of the nation. It is quite evident that M. Ribot, when he accepted the task of reforming a Cabinet, and after him M. Painlevé, had to satisfy the President of the Republic that the line of conduct to be adopted by the new Minister of the Interior should be very different from the course followed by the late one. We can rest assured that M. Poincaré is as strongly anti-German and as determined an adversary of the secret German agents still lingering in France, as M. Léon Daudet or M. Clémenceau. But his official character does not permit him to proclaim his opinions, or to enforce them, otherwise than within the rather narrow limits of his constitutional functions.

It is thereafter the turn of the Président du Conseil, whose duty it is to put into execution the general policy upon which

he and the President of the Republic are agreed, and to submit it for the approbation of Parliament.

M. Painlevé has already passed the ordeal of his first meeting with the Chamber of Deputies. His success on this occasion was moderate, for reasons which are not perhaps evident to outsiders. To begin with M. Painlevé is not an orator either by talent or by training. He is before everything a mathematician, illustrious in the estimation of that handful of specialists who know something about high mathematics. In other words he is a Professor, a distinguished member of the *Académie des Sciences*, and nothing in his manner or gesture savours of the popular speaker. His delivery is hesitating, abrupt, uninspired, and gives one the impression of a school-boy painfully reciting a lesson. I knew him once, on the occasion of a great official ceremony at the Sorbonne, lose the thread of his argument, and after a few minutes of embarrassing silence, sit down without finishing his discourse—which was, however, concluded with great tact and eloquence by that practised orator M. Barthou. With such a disadvantage one cannot help marvelling that M. Painlevé even succeeded in securing election as a deputy. But what is more marvellous still, is his actual attainment. In a few years he has, in spite of his lack of the gift of oratory, forced recognition of his remarkable intellectual qualities from the most critical assembly of speech-makers in the world.

This achievement is in itself a good omen. We have for many generations suffered from the fatal habit of empty parliamentary oratory. Words, words, words, and as few deeds as possible, has been the motto of the average French politician intent on escaping real responsibility. As a nation we are alas! much more sensitive than the British, or the Americans, to the persuasive power of sonorous and harmonious phrases. Briand, Ribot, Viviani, in fact all, or nearly all of our recent statesmen, have been worthy disciples of Gambetta. And this passion for making brilliant speeches

and for listening to them is certainly *one* of the characteristics of our Republican regime. Can it be that M. Painlevé's accession to power will inaugurate an era of realization instead of illusory promises and predictions?

The profound distrust of politicians which at the present critical time exists in most democracies, is principally, if not entirely, due to this policy of as much talk and as little action as possible. For the first time since the beginning of the war, the French people have a leader who, as he cannot talk, must either act or go. We can be certain, however, that M. Painlevé's intention in assuming the Premiership is to accomplish what his predecessors have failed to do.

The French nation looks to him to purge our country from the German peril within as well as without. He comes at the psychological moment, when the Government of the United States has proved to the world that a democracy, when well organised, can take even better than a despot all measures necessary to expose and to punish the crime of treachery, however securely the criminal may be entrenched behind international and financial interests.

I have no shadow of doubt that if M. Painlevé carries out fearlessly the policy, outlined the other day at Verdun by M. Poincaré, he will have behind him the solid mass of the nation. There is, moreover, no time to lose if the whole-hearted confidence of the French people in their political leaders is to be restored. While the war lasts nothing, not even the disquieting revelations concerning the *Bonnet Rouge*, should be allowed to endanger the "Sacred Union" of all parties in the State. Even if the Socialist party has for selfish reasons, adopted a sulking attitude towards M. Painlevé's Ministry, public opinion is not likely to tolerate any open rupture that might weaken the united front which the whole French nation must oppose, first to the armies, and secondly to the spies and diplomatists, in the service of the Central Empires.

The Perils of Restriction

To the Editor of LAND & WATER.

SIR,—The difficulty about Mr. Arthur Kitson's plea in last week's LAND & WATER for our not attempting to deflate the inflated currency after the war, is that the plea runs counter to both current economic theory (or a good deal of it) and the big financiers' interests. It is rather a powerful combination for him to be against.

Nevertheless, this fact of itself need not hinder his contentions from containing very urgent truth. The points upon which it seems to be important that public interest should be awakened may perhaps be comprised under two heads: (a) the fact that to leave the currency, as it is, after the war, helps the borrower, while to try to restrict it helps the lender; and (b) the double fact that, given time, our dislocated currency should right itself, and that interfering cannot hasten the process, it can only determine who shall suffer during the process. The whole question seems to be, whether will it be best for the nation to make it easy for those who have borrowed in the last few years or profitable for those who have lent?

This may perhaps not be the real question. And even if it is, to formulate the question is, of course, not to answer it. But at the very worst, it will be something if the formulating of it in this way enables someone else to see and say what is wrong with it. Meanwhile, I go on to give the elementary and simple reason for formulating it in this way.

To inflate the currency is to raise prices. Increase the amount of money and, *ceteris paribus*, you decrease its power of purchasing. Like other things, when it is abundant it is held cheap and you get less for it. The pound or the shilling does not go so far as it did. If, at the very time when the currency is inflated, supplies themselves are getting scarce, prices go so much the higher. And this, of course, is the situation at present.

Legal tender has been made abundant, therefore cheap. The necessities of life have become scarcer than usual, and so more precious. In consequence, it takes a great deal of the first to balance a given amount of the second.

There are clearly two ways in which the system can adjust itself again. The currency can be made more scarce. If money is more scarce a given quantity of it will buy more. Or the necessities of life may be made more abundant. If goods are more abundant, there will be more to be had for a given amount of money, whatever sort of money it may be. The former is the artificial, the latter the natural way of readjustment; in the sense that in the former instance we interfere with the currency (burn pound-notes and the like) while in the latter we both leave the currency alone and leave the necessities of life to find their own way back into the market again when the many hands now engaged in war return to

their normal productive occupations.

It makes no difference *in the end* which way is put into practice. If we succeed in restricting the currency, then, as production begins again we shall tend (at whatever cost in anxiety and trouble and loss) to have the old normal prices again. If we retain our present inflation we shall continue to have what we call abnormal prices, but we shall tend also to have abnormal wages, abnormal interest on money lent, higher incomes all round. And plainly, the question is not what we have to pay for goods, but the relation between what we must pay for them and what we possess to pay them with.

Since the end is the same, then, the whole question is as to the most desirable path whereby to reach it. On this, Mr. Kitson's argument seems conclusive. Restriction means that people with money out, in tools, machines, factories or whatever else, are compelled to realise. They cannot now have *so much* out. Those who have bought goods from them to retail are compelled in consequence to pay up, so they too must realise, and that at a loss, because the buying public have not the money—"in short, restriction of the currency is always followed by the industrial and commercial ruin of thousands."

At the same time, further discussion is to be wished for of the point that the people benefited by the cheap money are a greater part of the nation than those hurt by it. The argument about the National Debt seems at first sight to clinch the matter irrefutably. To restrict the currency is to raise the value of the pound. If we want, then, to escape all avoidable burdens, we should surely pay off that huge debt (whatever be the power of the cosmopolitan financiers to whom we owe it) with our money as it is; and not first double the value of our pound and then pay out the thousands of millions which we owe. The argument seems conclusive. But we cannot surely forget the numbers of people whose small incomes will be partly supplied from the three hundred millions of yearly interest which the nation has to pay on that debt. All whose income comes wholly from this source must be reckoned among those benefited by restriction. All whose income comes in any proportion from that source, must in that proportion be reckoned in the same class. And there are many other similar points—old-age pensions, people with annuities and so on.

Nevertheless, the main line of the argument seems clear. The main thing is to produce, and get the goods there again. The mere certificate for giving the individual a claim on the goods of the nation, which is all that money is, seems to be of its very nature a secondary affair. The natural course seems to be to let it alone, and keep our eye on the main task.

The University, Glasgow.

J. W. SCOTT.

Life and Letters

Marching on Tanga

By J. C. Squire

ACCURATE histories of the operations will no doubt be written, and there have been and will be produced very vivid journalistic descriptions of trench life and trench fighting: but it is not likely that we shall get from the Western Front—at any rate until the war is far behind us—a book with any permanent value as “pure literature.” The whole thing is too filthily ugly and monotonous in that expanse of mud, devastation and scientific slaughter, and it is of pathetic significance that the few good poems that have come from the trenches have almost all been poems of escape, snatches at stray beauties still remembered or within reach; the stars on a fine night; flowers in a ruined garden or on a parapet; memories of placid things at home. Moreover, even with circumstances at their best, good artists are few, and it is a chance whether those that exist happen to find themselves in places where they are moved to write about the things actually around them. I remember that Rupert Brooke, just before he went to Gallipoli, told me how clearly he retained the picture of the nocturnal flight from Antwerp, the confused stream of refugees along the road, the great sky lit up by the flames of burning buildings. He said he should write about it, and one wondered, a month or two later, what he would make of the Greek sea, the islands, and the battles in that parched and mountainous peninsula. Another young poet, J. E. Flecker, had he lived and been a soldier in an African or an Asiatic theatre, might also have given us an account that was something more than an account. But the first war narrative by a soldier which as literature can compare with the best contemporary imaginative work, is Captain F. Brett-Young's *Marching on Tanga* (Collins, 6s. net.). Captain Brett-Young (who is otherwise known as a poet and novelist) served as a doctor attached first to the 2nd Rhodesian Regiment, then to an Indian ambulance unit. He took part in the operations in the summer of 1916, when General Smuts drove the Germans from the foothills of Kilimanjaro down the Tanga railway. The author, having reached German Bridge, on the Pangani, then went with his brigade southwards along the trolley-line to Handeni, and beyond it towards the Central Railway. He finished up with fever and began this book in hospital. The manuscript was twice torpedoed, and once had to be completely rewritten. The reader can only be thankful that the author had an extraordinarily rare combination of qualities: the genius to write the book, and the patient industry to write the same book a second time. Most of us, if I may say so, would have seen the book damned first.

* * * * *

Captain Brett-Young supplies a good map, and a comprehensible account of the operations—from which it is possible to gather that medical arrangements might have been made with more forethought, that Smuts's generalship was sound, and that the personality of Smuts was largely responsible for the splendid spirit of the troops. Probably we should have been told more if no censors existed. But in any case, Captain Brett-Young's main business is only with the things which came under his observation, including his own state of mind and heart. He was often close to the fighting and sometimes in the thick of it; but in that campaign, actual fighting was intermittent, and the most formidable and constant presence in the book is African Nature, a far more terrible enemy than the Germans. The keynote of the whole book is struck in the first chapter. He strays a short distance into the forest from the station of Taveta, and there, in a clearing between pestilential creeks, he comes upon a company of emaciated black women dancing to exhaustion, whilst an old man and two boys beat tom-toms to drive away the devils of fever. The horror and strangeness of that country, the cruelty of its wild life, the reek of its forests, the awful drought of its deserts, are one of the main themes of the book, though they are never paraded. And another is its tremendous grandeur. Stepping out of that fever-laden forest of Taveta, he finds that the mist has lifted and there

Out of the mist range after range materialised, until, through those dissolving veils there loomed a shape far mightier than any which my brain could have conceived: Kilimanjaro, the greatest mountain of all Africa. Now that the sun had quite gone from our lonely sight, the glaciers on the fluted crater of Kibo shone with an amazing whiteness, while the snows of the sister peak, Mawenzi, were cold in shade.

The magnitude of these lovely shapes was overwhelming,

for they do not rise, as do the other African peaks, from the base of a mountainous table-land, but from the edge of a low plain, not two thousand feet above the sea-level. Since then I have seen the great mountain in many guises: as a dim ghost dominating the lower waters of the Pangani; as a filmy cone, imponderable as though it were carved out of icy vapours, gleaming upon hot plains a hundred miles away; as the shadow which rises from the level skylines of the great game reserve; but never did it seem so wonderful as on that night when it was first revealed to me, walking from the Lumi forest to Taveta. There was indeed something ceremonious in its unveiling, and the memory of that vast immance coloured all the evening of our departure.

* * * * *

You feel that great mountain, and others not so great, towering all the time behind the narrative. There are details enough; many unforgettable pictures of men and places, and delicate sketches of small wild things, hornbills and rain birds, acacia trees, dragonflies, orange tip butterflies. But his dominant impression throughout that campaign was that of the immensity of wild Africa and the smallness of the men who were crawling after each other through its swamps and over its sandy wastes, the enormous ferocity of nature in an untameable land, the transitoriness of man's journeys and fights in that wilderness, where in a year or two the deep tracks will have been overgrown by bush, the bleached bones of men and beasts, all the rubble of passing armies, drifted over by sand and put out of sight for ever. Beauty, Mutability, and Fate still dominated him even in his most desperate time when, with a little party of wounded men, having been foodless for thirty hours, he was surrounded by German-commanded savages who searched and searched for them without earshot whilst they crept or ran through the undergrowth, deliberately tangling their footprints and longing for the dark. He thought even then of the beauty of the grasses, and the evening light in that solitude, and then his mind flew back to the extremest contrast, a Devon summer afternoon “in a garden ravished with the spicy odour of pinks. A strange business this . . . a strange business, that I, torn and bleeding, should be running for my life through the heart of Africa, through dense thorn which had never been shadowed by man's figure or penetrated by his violence since the beginning of the world; while, at home, perhaps, she whom I loved most dearly was sitting in that summer garden among so many peaceful scents and knowing nothing . . . knowing nothing. It seemed incredible that this could be at all.” Then when night fell, and his parched and bleeding charges curled up in a nullah to take an hour of broken sleep, he watched the Southern Cross swing over the sky and wondered again “at the strangeness of fate which had cast me upon this strange land,” perhaps to feed the hyenas, and thought that he had rather die “in a country where the works of man bore witness of his unconquerable courage; where I might see on every side tokens of the great anonymous dead in whose footsteps I was following, and so take courage . . . For that which makes a place terrible or kindly is the life of men who have worked and suffered and loved and died in it. That was the way, I thought, in which a country got a soul; and this land had none.”

* * * * *

It makes the book quiet. The fighting breaks in and subsides again, as the machine guns rattled and died away in the green depths of those nutrodden forests. Whatever hardships and excitements briefly come, they subside; and reflection pours back in a flood. Various men took it no doubt in various ways, and with varying degrees of consciousness. But the author is a poet, and was never far, even when most active, from the mood in which, at the first camp by the Pangani, he sat with his comrades by the fire, listened to the sap hissing, looked at the shadowy figures around him, and wondered what men they were whom fate had dumped together in so strange a spot. His writing has scarcely a flaw from beginning to end, and many pages are exquisite in phrasing and movement. This does not mean that, at intervals, he lays himself out to be purple for the sake of the thing. It merely means that he always rises to the occasion, and that when his emotions are more than ordinarily deep or the sights and sounds of those hills and forests peculiarly in command of his senses, he lifts naturally into passages of sustained beauty. He communicates his awe.

According to Plan

By Boyd Cable

"RATTY" TRAVERS dropped his load with a grunt of satisfaction, squatted down on the ground, and tilting back his shrapnel helmet mopped a streaming brow. As the line in which he had moved dropped to cover, another line rose out of the ground ahead of them and commenced to push forward. Some distance beyond a wave of kilted Highlanders pressed on at a steady walk up to within about fifty paces of the string of flickering, jumping white patches that marked the edge of the "artillery barrage." The machine gun company being in support had a good view of the lines attacking ahead of them.

"Them Jocks is goin' along nicely," said the man who had dropped beside Ratty Travers. Ratty grunted scornfully. "Beautiful," he said. "An' we're doin' wonderful well ourselves. I never remember gettin' over the No Man's Land so easy, or seein' a trench took so quick an' simple in my life as this one we're in; or seein' a 'tillery barrage move so nice an' even and steady to time."

"You've seed a lot Ratty," said his companion. "But you ain't seed everything."

"That's true," said Ratty. "I've never seen a lot o' grown men playin' let's-pretend like a lot of school kids. Just look at that fool wi' the big drum, Johnny."

Johnny looked and had to laugh. The man with the big drum was doubling off from the kilted line, and strung out to either side of him there raced a scattered line of men armed with sticks and biscuit-tins and tin cans. Ratty and his companions were clothed in full fighting kit and equipment, and bore boxes of very real ammunition. In the "trenches" ahead of them, or moving over the open, were other men similarly equipped; rolling back to them came a clash and clatter, a dull prolonged boom-boom-boom. In every detail, so far as the men were concerned, an attack was in full swing; but there was no yell and crash of falling shells, no piping whistle and sharp crack of bullets, no deafening, shaking thunder of artillery (except that steady boom-boom), no shell-scorched strip of battered ground. The warm sun shone on trim green fields, on long twisting lines of flags and tapes strung on sticks, on ranks of perspiring men in khaki with rifles and bombs and machine-guns and ammunition and stretchers and all the other accoutrements of battle. There were no signs of death or wounds, none of the horror of war, because this was merely a "practice attack," a full-dress rehearsal of the real thing, full ten miles behind the front. The trenches were marked out by flags and tapes, the artillery barrage was a line of men hammering biscuit-tins and a big drum, and waving fluttering white flags. The kilts came to a halt fifty paces short of them, and a moment later, the "barrage" sprinted off ahead one or two score yards, halted, and fell to banging and battering tins and drum and waving flags, while the kilts solemnly moved on after them, to halt again at their measured distance until the next "lift" of the "barrage." It looked sheer child's play, a silly elaborate game; and yet there was no sign of laughter or play about the men taking part in it—except on the part of Ratty Travers.

Ratty was openly scornful. "Ready there," said a sergeant rising and pocketing the notebook he had been studying. "We've only five minutes in this trench. And remember you move half right when you leave here, an' the next line o' flags is the sunk road wi' six machine-gun emplacements along the edge."

Ratty chuckled sardonically. "I 'ope that in the real thing them machine-guns won't 'ave nothing to say to us movin' half-right across their front," he said.

"They've been strafed out wi' the guns," said Johnny simply, "an' the Jocks 'as mopped up any that's left. We was told that yesterday."

"I daresay," retorted Ratty. "An' I hopes the Huns 'ave been careful instructed in the same. It 'ud be a pity if they went an' did anything to spoil all the plans. But they wouldn't do that. Oh, no, of course, not."

He had a good deal more to say in the same strain—with especially biting criticism on the "artillery barrage" and the red-faced big drummer who played lead in it—during the rest of the practice and at the end of it when they lay in their "final objective" and rested, smoking and cooling off with the top buttons of tunics undone, while the officers gathered round the C.O. and listened to criticism and made notes in their books.

"I'll admit," he said, "they might plan out the trenches here the same as the one's we're to attack from. It's this rot o' fayin' out the Fritz trenches gets me. An' this attack—it's about as like a real attack as my gasper's like a machine-

gun. Huh! Wi' one bloke clockin' you on a stop-watch, an' another countin' the paces between the trenches—Boche trenches a mile behind their front line mind you—an' another whackin' a big drum like a kid in a nursery. An' all this 'Go steady here, this is a sharp rise,' or 'hurry this bit 'cos most likely it'll be open to enfiladin' machine-gun fire,' or 'this here's the sunk road wi' six machine-gun emplacements—huh! Plunky rot, I calls it."

The others heard him in silence or with mild chaffing replies. Ratty was new to this planned-attack game, of course, but since he had been out and taken his whack of the early days he was entitled to a certain amount of excusing.

Johnny summed it up for them. "We've moved a bit since the Noove Chapelle days, you know," he said. "You didn't have no little lot like this then, did you?" jerking his head at the bristling line of their machine-guns. "An' you didn't have creepin' barrages, an' more shells than you could fire, eh? Used to lose seventy an' eighty per cent. o' the battalion's strength goin' over the bags them days, didn't you? Well, we've changed that a bit, thank Gawd. You'll see the differ presently."

Later on Ratty had to admit a considerable "differ" and a great improvement on old ways. He and his company moved up towards the front leisurely and certainly, without haste and without confusion, having the orders detailed overnight for the next day's march, finding meals cooked and served regularly, travelling by roads obviously known and "detailed" for them, coming at night to camp or billet places left vacant for them immediately before, finding everything planned and prepared, foreseen and provided for. But, although he admitted all this, he stuck to his belief that beyond the front line this carefully planned moving must cease abruptly. "It'll be the same plunky old scramble an' scrap I'll bet," he said. "We'll see then if all the Fritz trenches is just where we've fixed 'em, an' if we runs to a regular time-table and follows the laid-down route an' first-turn-to-the-right-an'-mind-the-step-performance we've been practisin'."

But it was as they approached the fighting zone and finally when they found themselves installed in a support trench on the morning of the Push that Ratty came to understand the full difference between old battles and this new style. For days on end he heard such gun-fire as he had never dreamed of, heard it continue without ceasing or slackening day and night. By day he saw the distant German ground veiled in a drifting fog-bank of smoke, saw it by night starred with winking and splashing gusts of flame from our high-explosives. He walked or lay on a ground that quivered and trembled under the unceasing shock of our guns' discharges, and covered his eyes at night to shut out the flashing lights that pulsed and throbbled constantly across the sky. The last march up that had brought them into the trenches had passed through guns and guns and yet again guns, first the huge monsters lurking hidden well back and only a little in advance of the great piles of shells and long roofed sidings crammed with more shells; then further on past other monsters only less in comparison with those they had seen before, or again past whole batteries of 60-pounders and six-inch tucked away in corners of woods or amongst broken houses, and finally up through the field guns packed close in every corner that would more or less hide a battery, or brazenly lined up in the open. They tramped down the long street of a ruined village—a street that was no more than a cleared strip of cobble-stones bordered down its length on both sides by the piled or scattered heaps of rubble and brick that had once been rows of houses—with a mad chorus of guns roaring and cracking and banging in numberless scores about them, passed over the open behind the trenches to find more guns ranged battery after battery, and all with sheeting walls of flame jumping and flashing along their fronts. They found and settled into their trench with this unbroken roar of fire bellowing in their ears, a roar so loud and long that it seemed impossible to increase it. But when their watches told them it was an hour to the moment they had been warned was the "zero hour," the fixed moment of the attack, the sound of the gun-fire swelled suddenly and rose to a pitch of fury that eclipsed all that had gone before. The men crouched in their trench listening in awed silence, and as the zero hour approached Ratty clambered and stood where he could look over the edge towards the German lines. A sergeant shouted at him angrily to get down, and hadn't he heard the order to keep under cover. Ratty dropped back beside the others. "Lumme," he said disgustedly, "I dunno wot this bloomin' war's comin' to. Orders, orders, orders! You

mustn't get plunky well killed nowadays, unless you 'as orders to."

"There they go," said Johnny suddenly, and all strained their ears for the sound of rattling rifle fire that came faintly through the roll of the guns. "An' here they come," said Ratty quickly, and all crouched low and listened to the rising roar of a heavy shell approaching, the heavy *cr-r-rump* of its fall. A message passed along, "Ready there. Move in five minutes." And at five minutes to the tick, they rose and began to pass along the trench.

"Know where we are, Ratty?" asked Johnny. Ratty looked about him. "How should I know," he shouted back, "I was never 'ere before."

"You oughter," returned Johnny. "This is the line we started from back in practice attack—the one that was taped out along by the stream."

"I'm a fat lot better for knowin' it too," said Ratty sarcastically, and trudged on. They passed slowly forward and along branching trenches until they came at last to the front line, from which, after a short rest, they climbed and hoisted their machine guns out into the open. From here for the first time they could see something of the battle-ground; but could see nothing of the battle except a drifting haze of smoke, and, just disappearing into it, a shadowy line of figures. The thunder of the guns continued, and out in front they could hear now the crackle of rifle fire, the sharp detonations of grenades. There were far fewer shells falling about the old "neutral ground" than Ratty had expected, and even comparatively few bullets piping over and past them. They reached the tumbled wreckage of shell holes and splintered planks that marked what had been the front German line, clambered through this, and pushed on stumbling and climbing in and out the shell-holes that riddled the ground. "Where's the Buffs that's supposed to be in front o' us," shouted Ratty, and ducked hastily into a deep shell-hole at the warning screech of an approaching shell. It crashed down somewhere near and a shower of dirt and earth rained down on him. He climbed out. "Should be ahead about a—here's some o' them now wi' prisoners," said Johnny. They had a hurried glimpse of a huddled group of men in grey with their hands well up over their heads, running, stumbling, half falling and recovering, but always keeping hands hoisted well up. There may have been a full thirty of them, and they were being shepherded back by no more than three or four men with bayonets gleaming on their rifles. They disappeared into the haze, and the machine gunners dropped down into a shallow twisting depression and pressed on along it.

"This is the communication trench that used to be taped out along the edge o' that cornfield in practice attack," said Johnny, when they halted a moment. "Trench," said Ratty, glancing along it "Strewth!" The trench was gone, was no more than a wide shallow depression, a tumbled gutter a foot or two below the level of the ground; and even the gutter in places was lost in a patch of broken earth heaps and craters. It was best traced by the dead that lay in it, by the litter of steel helmets, rifles, bombs, gas-masks, bayonets, water-bottles, arms and equipment of every kind strewed along it.

By now Ratty had lost all sense of direction or location, but Johnny at his elbow was always able to keep him informed. Ratty at first refused to accept his statements, but was convinced against all argument. "We should pass three trees along this trench somewhere soon," Johnny would say, and presently, sure enough, they came to one stump six foot high and two splintered butts just showing above the earth. They reached a wide depression, and Johnny pointed and shouted, "The sunk road," and looking round, pointed again to some whitish grey masses broken, overturned, almost buried in the tumbled earth, the remains of concrete machine gun emplacements Ratty remembered had been marked somewhere back there on the practice ground by six marked boards. "Six," shouted Johnny, and grinned triumphantly at the doubter.

The last of Ratty's doubts as to the correctness of battle plans, even of the German lines, vanished when they came to a bare stretch of ground which Johnny reminded him was where they had been warned they would most likely come under enfilading machine gun fire. They halted on the edge of this patch to get their wind, and watched some stretcher-bearers struggling to cross and a party of men digging furiously to make a line of linked up shell-holes, while the ground about them jumped and splashed under the hailing of bullets.

"Enfiladin' fire," said Ratty, "Should think it was too. Why the 'ell can't they silence the guns doin' it?"

"Supposed to be in a clump o' wood over there," said Johnny, "And it ain't due to be took for an hour yet."

The word passed along, and they rose and began to cross the open ground amongst the raining bullets. "There's our objective," shouted Johnny as they ran. "That rise—

come into action there." Ratty stared aghast at the rise, and at the spouting columns of smoke and dirt that leaped from it under a steady fall of heavy shells. "That," he screeched back, "Gorstrewth. Goodbye us then." But he ran on as well as he could under the weight of the gun on his shoulder. They were both well out to the left of their advancing line and Ratty was instinctively flinching from the direct route into those gusts of flame and smoke. "Keep up," yelled Johnny. "Remember the trench. You'll miss the end of it." Ratty recalled vaguely the line of flags and tape that had wriggled over the practice ground to the last position where they had halted each day and brought their guns into mimic action. He slanted right and presently stumbled thankfully into the broken trench, and pushed along it up the rise. At the top he found himself looking over a gentle slope, the foot of which was veiled in an eddying mist of smoke. A heavy shell burst with a terrifying crash and sent him reeling from shock. He sat down with a bump, shaken and for the moment dazed, but came to himself with Johnny's voice bawling in his ear, "Come on man, come on. Hurt? Quick then—yer gun." He staggered up and towards an officer whom he could see waving frantically at him and opening and shutting his mouth in shouts that were lost in the uproar. He thrust forward and into a shell hole beside Johnny and the rest of the gun detachment. His sergeant jumped down beside them shouting and pointing out into the smoke wreaths. "See the wood . . . six hundred . . . lay on the ground-line—they're counter-attack——." He stopped abruptly and fell sliding in a tumbled heap down into the crater on top of the gun. The officer ran back to them mouthing unheard angry shouts again. Ratty was getting angry himself. How could a man get into action with a fellow falling all over his gun like that? They dragged the sergeant's twitching body clear. Ratty felt a pang of regret for his anger. He'd been a good chap, the sergeant. But anger swallowed him again as he dragged his gun clear. It was drenched with blood. "Nice bizness," he said savagely, "if my breech action's clogged up." A loaded belt slipped into place and he brought the gun into action with a savage jerk on the loading lever, looked over his sights, and layed them on the edge of the wood he could just dimly see through the smoke. He could see nothing to fire at—cursed smoke was so thick—but the others were firing hard—must be something there. He pressed his thumbs on the lever and his gun began to spurt a stream of fire and lead, the belt racing and clicking through, the breech clacking smoothly, the handles jarring sharply in his fingers.

The hillock was still under heavy shell-fire. They'd been warned in practice attack there would probably be shell-fire, and here it was, shrieking, crashing, tearing the wrecked ground to fresh shapes of wreckage, spouting in fountains of black smoke and earth, whistling and hurtling in jagged fragments, hitting solidly and bursting in whirlwinds of flame and smoke. Ratty had no time to think of the shells. He strained his eyes over the sights on the foot of the dimly seen trees, held his gun steady and spitting its jets of flame and lead, until word came to him somehow or from somewhere to cease firing. The attack had been wiped out, he heard said. He straightened his bent shoulders and discovered with immense surprise that one shoulder hurt, that his jacket was soaked with blood.

"Nothing more than a good Blighty one," said the bearer who tied him up. "Keep you home two-three months mebbe."

"Good enough," said Ratty. "I'll be back in time to see the finish," and lit a cigarette contentedly.

Back in the Aid Post later he heard from one of the Jocks who had been down there in the smoke somewhere between the machine guns and the wood, that the front line was already well consolidated. He heard too that the German counter-attack had been cut to pieces, and that the open ground before our new line front was piled with their dead. "You fellies was just late enough wi' your machine-guns," said the Highlander. "In anither three-fower meenits they'd a been right on top o' us."

"Late be blowed," said Ratty. "We was on the right spot exactly at the programme time o' the plan. Whole plunky attack went like clockwork, far's our bit o' the plans went."

But it was two days later and snug in bed in a London hospital, when he had read the dispatches describing the battle, that he had his last word on "planned attacks."

"Lumme," he said to the next bed, "I likes this despatch of ole Indenburg's. Good mile an' a half we pushed 'em back, an' held all the ground, an' took 6,000 prisoners; an', says Indenburg, the British attack was completely repulsed . . . only a few crater positions were abandoned by us accordin' to plan."

He dropped the paper and grinned. "Accordin' to plan," he said. "Yes; it was accordin' to plan right enough. But 'e forgot to say it was accordin' to the plan that was made by 'Aig an' us."

Will you help the National Tribute to Lord Roberts ?

The £500,000 NATIONAL TRIBUTE FUND TO PERMANENTLY ENDOW The Lord Roberts' Memorial Workshops throughout the Country where men permanently disabled on active service can work and earn an honest living.

The Lord Roberts' Memorial Workshops

is the National and most practical way of finding work at good wages for those who have fought for us and have the right to work again. It is a sound business concern—not a charity.

No cause could be more worthy of your support and no tribute to our Greatest Soldier could be more practical.

£20,740 has been paid in wages to disabled men and dependents during 1916. There has been a trade turnover of

£48,583 during 1916. These figures speak for themselves and show the great practical utility of the scheme.

1,029 badly disabled men have already been admitted to the Workshops.

Will you send in a donation to-day ?

THE TRIBUTE FUND is now nearly *half* completed, thanks to the generosity of tens of thousands of people throughout the world who loved Lord Roberts and appreciate this sound tribute to his memory. It is hoped to complete the Fund this year. Will those who are helping please do their best in organizing entertainments and collections, and, if the public will aid this most worthy cause by subscribing generously, the problem of finding work for our soldiers or sailors permanently disabled on active service will be partially solved.

EVERY penny that you give goes to swell the capital sum that can make these Workshops self-supporting by providing them with the plant and premises which are as necessary in this case as they are to any ordinary manufacturing concern. **NO RED TAPE, NO DELAY.** The man starts at £1 per week, and keeps every penny of his pension. What you give does not merely alleviate a passing phase of distress; *it helps to make safe and happy the future of our disabled men now and after the war.*

Make Cheques payable to Major-General The Lord Cheylesmore, K.C.V.O., Chairman, The Lord Roberts' Memorial Fund, 122, Brompton Road, London, S.W. 1.

Factories at London, Plymouth, Brighton, Colchester, Birmingham, Nottingham, Liverpool, Bradford, Newcastle, Edinburgh & Belfast.

Major-General
The Lord Cheylesmore, K.C.V.O.,
Chairman.
Rt. Hon. Sir Fredk. Milner, Bart., P.C.,
Hon. Treasurer.
Major Tudor Craig,
Comptroller.
Charles Frederick Higham,
Honorary Appeal Organiser.

A DONATION
TO-DAY PLEASE.**

The Pictures show disabled men at work in the shops. Come and see them at work it will do you good.

The British Firing Line

By Charles Marriott

CONSISTENCY is a great virtue, in art as well as in life, and Lieutenant E. Handley-Read, a selection of whose water-colours of "The British Firing Line" has just been published by the Leicester Galleries, is consistent both in his outlook and in his artistic methods. His outlook is best described in his own words.

The mournful landscape of the Somme battlefields, scored and intersected by miles of trenches, covered, in addition, with the results of other human endeavour in the alternating processes of construction and destruction fills the mind to overflowing with thoughts too deep and too varied to set down in a Foreword to a few pictures.

To say that some of these deep and varied thoughts have overflowed into the pictures themselves is to indicate the personal character of this record of what the artist himself aptly calls "a landscape painter's war." Not that the personal character prejudices the truth of the record. On the contrary; for it is one of the apparent paradoxes of art that a man is never so likely to give a truthful impression of anything seen as when he allows full play to mood and temperament. The untrustworthy witness is the man who sets out to be a detached observer. He is so keen on keeping himself out of it that the effort affects the impression. The subjects of Lieutenant Handley-Read's drawings are varied enough, but they are all seen and set down in the same full-hearted conception of a martyred countryside; and in looking at them one makes the same unconsenting allowance as one makes for the emotions of a sincere speaker.

As to the method, the astonishing thing is that the artist was not better known before the war. Obviously he came to it fully equipped with something that might be compared to a clear, simple and fluent style in writing. The method is varied to suit the individual scene or subject, but it is the same style all through; broad and free in statement, descriptive rather than expressive in character, and sympathetic to the actual materials employed. No doubt the war, and the exacting conditions of work, had a clarifying and confirming effect upon the style of the artist; but nothing could look less like an unsuspected ability called out by the interest of the occasion. Consequently there is no effect of time lost and accuracy compromised by technical difficulties. Everything is set down with unworried ease and fluency, with detail enough but no dwelling on essentials, and a quite remarkable tact in arrangement—from both the pictorial and the topographical points of view.

It is this double consistency, of outlook and style, that distinguishes the work of Mr. Handley-Read from other good drawings of the war. Nobody else has done anything that gives quite the same impression of a connected series. Generally the interest of the moment, actual or technical, has arrested the attention of the artist from time to time, so that you get a collection of individual drawings good in themselves but without any background of mood or similarity of treatment to relate them. But here you have a series that seems to have been designed and carried out with a single motive, and publication in the present form was almost imperative.

Apart from that, the drawings illustrate the war from a particular angle, or on a particular plane. There never was a war or any other sequence of events that has been "covered" on so many different planes—mental as well as material. We have had careful topographical studies of wide fields of operations, from the ground and from the air, comments on the vast mechanical forces employed or on the phenomena of explosions, notes on the human side of the close-packed life of trenches, and so on. Leaving out individual differences of style, artists have concentrated on many different aspects of the war as if, in addition to being artists they were tacticians, geographers, engineers, chemists or novelists as the case might be. Mr. Handley-Read gives us war from the landscape painter's point of view; or, more precisely, from the point of view of the landscape. The emotional background to which all his pictures are finally related is that of the sufferings of Nature.

An impression, however, is left outstanding—at first passed over in the great chaos. It is born of the tortured trees twisted into unnatural shapes, splintered at their bases, uprooted and bent or stretching gaunt arms to the sky. Here is a veteran of the forest battered and torn, there a slender and graceful trunk with a few twigs as yet only bullet-clipped. Sturdy willows are seen hurled, root upwards, into a shell hole. Such sights fix themselves ineffaceably in the mind. Everywhere the murdered trees haunt the vision.

Beyond showing, as do also the notes to individual drawings, that Mr. Handley-Read is as eloquent with the pen as with the pencil, the above passage leaves no doubt as to the real motive

of his work. Incidentally he has made many drawings of towns and villages, but it is as part of the landscape rather than as examples of architecture that they have appealed to him. Even the topographical accuracy which excites the admiration of fighting men is really incidental; and this brings home the valuable truth that an artist is never so likely to be true to life as when he is moved by some general idea behind the facts of life. The fallacy of conscious "realism" is to suppose you can find truth in a moral and emotional vacuum. It is because Mr. Handley-Read has been so possessed by the "murdered trees" that he has been accurate in his delineation of ruined buildings and in his implied suggestion of all the other aspects of the war. Truth to feeling always results in truth to the facts—even if the facts are not stated; and working faithfully on one plane Lieut. Handley-Read has been, almost without knowing it, faithful on all the others.

Even the remarkable absence of the human element from his drawings is due, not to negative indifference to the human side of the war, but to positive concentration upon the landscape side of it. There never was an event, or series of events, of which it could be said with more point: "You cannot both be in the procession and look out of the window." And even if you are not actually "in the procession" you cannot see the landscape and the fighting at the same time. The weakness of most war pictures done at home, even by men familiar with war, when they deliberately set out to give a full impression of it, is that they do try to combine the fighting and the landscape. In some wars this may have been possible, and even in some incidents of the present war; but then the fighting did not look in the least like fighting but only like a lumbering trot across broken ground, not more significant of battle than the straggling across the course at the end of a race—as may be seen in that astonishing Canadian official photograph of "The Taking of Vimy Ridge." So that the drawings by Lieutenant Handley-Read must not be looked upon as studies of the background with the fighting left out. The fighting was not there, or at least not visible, though possibly going on between the foreground and the middle distance. As the artist says: "Never has there been such a secretive war. A man may travel to his fire trench, and never appear above ground. He may be in the same neighbourhood for weeks; and see nothing of it beyond the glimpse that his loophole or periscope affords. He may be surrounded with hurrying life, troops massing for an attack, relieving trenches, carrying up supplies, but he will see nothing but his own immediate surroundings, and a glimpse of the still more deserted stretch of 'dead land' between his own and the enemy's trenches."

"Ruin, emptiness, heart-breaking dreariness" are the key-notes of the drawings. But, being true to feeling, they do not imply that all is over with the landscape. They show the wounds in the bosom of Nature, and the ruin of the works of man that are nearest to that bosom, but they do not fail to suggest the tenacity of life in trees and the breath of life that moves in the atmosphere. It is astonishing, indeed, how much of season and weather the artist has conveyed while seeming only to mark the destructive effects of war. Therefore the drawings are not depressing; they retain the assurance that life goes on, in the landscape as in the human spirit. None of the drawings happens to deal with one of the worst brutalities of the enemy; the wanton destruction of orchard trees; but in this connection I lately read something so perfectly in sympathy with the artist's ideas about Nature that it will not be out of place to speak of it here. It was that in every English village the women and children should plant two saplings of apple, pear, plum or cherry, one to be transplanted in France or Flanders when opportunity shall offer, the other to be reared at home. By this means not only will the orchards of France and Flanders be renewed, but there will be established between the Allies a sisterhood of fruit-bearing trees. The scheme, for it has already passed beyond a suggestion, seems to me as practical as it is beautiful.

With all his consistent grasp of the particular aspect of the war that he has been moved to illustrate, and all his incidental accuracy, it is finally the emotional interest of landscape that the artist brings home to us. For the future his drawings will preserve the mood as well as the look of the British Firing Line in its present condition. It only remains to add that his publishers and printers have done all that skill can do to preserve the quality of the original drawings in reproduction.

The British Firing Line

By Lieut. E. Handley-Read

Chocolat Menier Corner

By Lieut. E. Handley-Read

La Bassée Canal

We reproduce two drawings from the British Firing Line Portfolio by Lieut. E. Handley-Read. The Portfolio contains twelve engravings in colour, with an Introduction by Hilaire Belloc, and is published by George Pulman and Sons, Ltd., for the Leicester Galleries. A limited number of copies of this Portfolio may be obtained, £5 5s. each, on application to the publishers, or "Land & Water," 5, Chancery Lane, W.C.2

Recent Volumes of Note

MY daughter Christine, who wrote me these letters, died in a hospital in Stuttgart on the morning of August 8th 1914. . . . So Mrs. Cholmondeley begins the introduction which she has written to *Christine* (Macmillan 6s. net), a book, or rather a collection of letters, of little more than 250 pages, but at the same time one of the most vital and intense condemnations of Germany that has been or will be produced. One can hardly doubt the genuineness of these letters; Christine arrived in Germany in May of the year of fate; she wrote to the being she loved best, wrote her impressions of the life she had to live while perfecting her great gift of violin playing, and into her descriptions of her own life come comments on Germany and German ways, unstudied comments, made before the war showed to the world what Germany really is, and doubly valuable in that, being the impressions of a girl, recorded in normal, peaceful times, they form convincing evidence of German blood-guiltiness. Here are extracts:

They've been working for years for the moment when they can safely attack. It has been the Kaiser's one idea.

Russia and France will not interfere with so just a punishment. Said by a German Professor with reference to the Austrian demands on Serbia in July of 1914.

The talk of the war has been going on (in Germany) growing in clamour . . . ever since the present Kaiser succeeded to the throne.

To-day they were saying at breakfast that, if a crime is big enough, it leaves off being a crime, for then it is a success, and success is always a virtue—that is, I gather, if it is a German success; if it is a French one, it is an outrage.

We (a German professor speaking) are polite only by the force of fear. Consequently—for all men must have their relaxations—whenever we meet the weak, the beneath us, the momentarily helpless, we are brutal. It is an immense relief to be for a moment natural. Every German welcomes even the smallest opportunity.

I always, you see, think of Germany as the grabber, the attacker.

One is tempted to quote and to go on quoting these damning parentheses in the letters of a daughter to her mother. Better propaganda work than the publication of the book could not be done, and Mrs Cholmondeley deserves thanks for having given her daughter's letters to be read, let us hope, wherever the English tongue is spoken.

* * * * *

The Great War in 1916 is the title of the new edition de luxe of Raemaekers' cartoons, which has just been issued by the Pine Art Society, 148, New Bond Street (£6 6s.). It contains 60 cartoons which constitute a vivid record of the progress of the war during 1916. Raemaekers' genius seems to strengthen with time; it is remarkable how seldom he repeats himself. No living cartoonist is more active minded than he, more quick to respond to a new impression. Mr. Perry Robinson in the Appreciation which he contributes as a preface to this sumptuous volume writes: "The greatness of Raemaekers rests on the fact that he combines all qualities, fervour for the right and a burning indignation against wrong, imagination and artistic power, and, not least, an insight and critical instinct which would have made him a brilliant writer if he had not been an artist." This last quality has never been more notable than in his most recent work dealing with the war from the American point of view.

* * * * *

This volume, although it represents only a part of Raemaekers' work during 1916, contains some of his most famous cartoons, notably, the Kaiser and the Crown Prince standing on the pile of German dead looking towards Verdun, with the legend, "Father, we must have a higher pile to see Verdun"; the scene of Christ cleansing the Temple, and the famous double cartoon of Berlin, August, 1914 (on the declaration of war), and Berlin, December, 1916 (on the first suggestion of peace). This double cartoon is remarkable in that Death appears in each scene—in 1914 as a mocking clown egging on the drunken crowd, and in 1916 as a prosperous fur-coated figure, smoking a big cigar, the only contented being in the miserable group. Not since the Dance of Death has any cartoonist made such great play with the grisly skeleton; twice he is introduced in the company of the Crown Prince; once the latter is throwing dice with him, the Kaiser looking on, and in the second after the Verdun defeat. Death decorates the grinning degenerate with the "Order of Butchery, with the Knives"—a necklet of skulls. Had the heir of the Hohenzollerns been three times the man he is, his reputation

could never have survived Raemaekers' deadly pencil. As it is, he will go down to history in his true colours, thanks to the Dutch cartoonist's unerring draughtmanship.

* * * * *

The Kaiser is a favourite figure, but Raemaekers always allows him a certain dignity, even in that most amusing picture, William Robert Macaire's answer to President Wilson: "Well, Sir, if you insist we will try and behave like gentlemen." (Cartoon 13) Another cartoon in which Wilhelm urges "Tino" to stab General Sarraill in the back, is said to have caused intense indignation at Potsdam; we can well believe it. If, as everyone hopes and believes, as a result of the war, the Hohenzollern breed will be cleared out of all positions and places where they can work harm, it will be in no small measure due to the presentation of this pestilential family, as they really are in life, by Raemaekers' pencil. This volume is of course, an historical record; already, even now, looking back we begin to see the war in perspective. The Zeppelin practically disappears after 1916, while the Tank makes its first appearance that year (Cartoon 25). Then there are four terrible drawings depicting German Slavery. This volume also contains some beautiful work. *Le Vieux Poilus* a wonderful character study of an old French soldier. There is the picture which the artist specially drew for St. Dunstan's, which, by the way, is one of the rare instances when Raemaekers has failed to catch quite the right spirit. But he was never better than in the noble tribute paid to "An American who gave his life for Humanity." The more we study this collection of cartoons, the more obvious it becomes that Raemaekers will be regarded by posterity as the greatest figure in the world of art which this terrible upheaval produced during its progress.

* * * * *

For constancy and determination to fight a war to a finish there is no closer parallel to the present struggle in modern times than the American Civil War. It is particularly appropriate that this oft-told tale should be told again just at this moment, and we owe a debt of gratitude to Dr. Rossiter, the author, and Messrs. Putman, the publishers, for *The Fight for the Republic* (12s. 6d. net.) This book is described as "a narrative of the more noteworthy events in the War of Secession, presenting the great contest in its dramatic aspects." There is no living writer better fitted to handle the subject than Dr. Johnson, who is not only an acknowledged authority but has a charming style. The story is told simply and to the point; the battles are explained by frequent maps and the reader is made to see quite clearly the underlying principles. The fight in truth was for the corporate life of the States rather than for the limitation of slavery, which happened to be the issue on which the greater question turned at first. But with the Proclamation of Emancipation it ceased to be a war for temporary peace, but a war for enduring peace and at the end of it we are told no American could henceforth say: "The United States are a confederation, but the United States is a Nation." This truth is being realised to-day. But for that terrible Civil War of over fifty years ago when the daily loss of life for a period of four years was 400, America would never have been able to have championed humanity as she is now doing. This fight for the Republic is a story as full of vital episodes and thrilling incidents as when it was in progress. It is a help to look back and see how a war must be sternly fought to an absolute finish if the principles that are in the balance are to survive.

PICCADILLY
 CIRCUS
 VIRGINIA CIGARETTES

PICCADILLY CIRCUS has, in the past,
 meant only one thing—the most famous
 "street-crossing" in the world.

In future, it will mean two things—the Circus
 itself, and the **hand-made** "PICCADILLY
 Circus" Virginia Cigarette.

Leaf by leaf, the most perfect of the nature-
 matured Old Belt and Eastern Carolina
 Tobacco is selected, straightened and carefully
 cut by experts.

Hand-workers of exceptional skill are ex-
 clusively employed in making these Cigarettes.

Every detail has been so attentively provided for, that only one
 result was possible—the "PICCADILLY Circus" Cigarette
 is the best Virginia Cigarette that ever has been, or ever can be,
 offered to smokers at a moderate price.

25 for 1/7

To be obtained of all high-class Tobacconists.
 ALEXANDER BOGUSLAVSKY, Ltd., 55, Piccadilly, LONDON, W. 1.

BOMBARDMENT OF LONDON

THE bombardment of London has been in progress at nights more or less regularly for ten days. Two or three rather obvious facts stand out saliently. The enormous size of London is one. The Germans can claim truthfully to have dropped bombs on the British metropolis, though these explosions may have been inaudible to one-half of the people of London. This is a fact to be emphasised, for probably even its own inhabitants have hardly realised before, except in the vaguest manner, what a vast area the name of that old Roman camp on a hillock above the Thames covers to-day. When a Briton, an Ally or a Neutral reads that London has been bombarded, he must not regard it as though this thing had occurred in the city or town with which he is most familiar, but know it has happened to a county or big district. Another salient fact is the efficiency of the local defences *under present circumstances*. Persistent attempts have been made by the enemy planes under peculiarly favourable climatic conditions to penetrate to the heart of London. They have been practically thwarted. Already Londoners, with that adaptiveness to unpleasant experiences and disregard of personal peril which is so distinctive of British character, are personifying the local batteries with whose reports they are growing familiar. There is Long Tom, with the loud voice and long arm, who makes a big noise but is comforting. Mother Jones talks with a regular scream, but no hen clucks her chickens under her wing with a stronger sense of protection than she. And so it goes on. When a bomb falls, it is over almost before one knows it has fallen. "That's that" is the usual remark if one is still there. The British Londoner has stood this bombardment with splendid composure and the more frequently it is renewed the less it perturbs him.

But from these two facts spring others. It is obviously impossible that the county of London can ever be adequately protected locally. There is only one effective system of defence. It is an old system: Drake practised it when Elizabeth was Queen; Nelson when George III. was on the throne. Carry the war into the enemy's country. It was the harbours of Spain and France in those days; it is the cities and towns of Germany to-day. There is nothing new in this so-called "policy of reprisals." England would not be England, had we not carried out this very policy in other centuries. In these recent aerial fights over London, there have been as gallant men, as splendid dare-devils engaged as ever fought under Nelson and Drake. Give them the necessary craft and loose them, and Germany will rue the nights her bombs fell on London. Meantime, the Germans declare (and we believe they are honestly of that opinion) that the only reason we do not invade their cities is that we are unable or frightened

to. In Mr. Hugh Gibson's story of Louvain, related to-day, a small incident is recorded, illuminative of the Teuton character. A drunken German soldier insulted one of their party. A German officer was luckily with them; "he waded into the soldier in a way that would have caused a mutiny in any other army." The German's one idea of strength is ruthless brutality. We need not go to anything like his extremes, but before he will cry off, he must be taught that his enemy has it in his power to be just as brutal and ruthless as any German if it so pleases him.

London will never be allowed to sleep quietly at nights until the invasion of Germany by air is an accomplished fact. When the accomplishment is carried into effect, is a purely military question. Meantime, it is well to push on as rapidly as possible with the building of aircraft. Like shipbuilding of old, this is mainly a private enterprise; wisely so, for it brings into play individual energy and daring. Behind these there must be money; it is the duty of good citizens to support most liberally all aircraft enterprises, which are rightly organised and conducted and have proved their capacity and efficiency for construction. We are building our aerial fleets in the same effective way as we constructed our wooden navies when British supremacy at sea was in the balance. Though we may have lagged behind and have failed to envisage the sky peril, the bombardment of London has been a salutary lesson. The pride of the country is touched and the nation is now determined that in so far as it lies in its power, the noise of the last few nights over London shall be a child's rat-a-tat-tat compared with the drum-fire that shall resound through the cities of Germany before the winter is over. The magnificent feats of our flying men in Flanders is sufficient evidence that this is no empty threat.

Another salient fact of the bombardment is that at last the general public have been awakened to the alien danger in our midst. It was a common sneer of Germans before the war that London was the cesspool of Europe. We have discovered in the last few days that there is a much too considerable amount of unpleasant truth in this contemptuous saying. A low type of Continental Jew has not merely on these nights attempted to invade, to the exclusion of the local British poor, all the underground shelters, but this unsavoury crowd has, like a blocked sewer, spread itself over the Home Districts, swamping villages twenty and thirty miles away and even further where cheap railway transport is available. It is already becoming a sanitary menace in country districts, and serious steps will have to be taken without any delay. It is not a question at the outset for the Government, the local authorities should tackle it to begin with; the London County Council setting the example. An L.C.C. Committee might be appointed at once to investigate the exodus and general behaviour of these mobs of unclean, undersized, ill-favoured folk during the last ten days, with a view to an attempt being made to head them back to the regions whence they came once the war is over. Always detested by the genuine Londoner, this detestation is developing into a stronger and more active feeling in many of the poorest districts, as the writer can declare out of personal experience. Not only have these aliens displayed miserable poltroonery—the men even worse than the women—but by their attitude and manner they have spread fear and promoted panic just when the genuine Londoner was doing his best to create confidence and composure. This alien danger will not cease with the war; these creatures breed rapidly, a fact that has been recently only too unpleasantly obvious, and they are introducing into the nation a strain of blood most undesirable, physically and morally. It is no exaggeration to say that until this bombardment scared these human rats from their East End haunts, not one educated person in ten realised their existence, let alone their numbers. It is all very well to allow the dogs to eat the crumbs that fall from the children's table, but when because of this kindness, the dogs multiply and begin to drive the children out of the home, drastic action must be taken. If the invasion of German aeroplanes leads to this alien question being at last dealt with in a thorough and serious manner, then we may feel with reason that there is a good side even to the bombardment of London.

The War

The Second Blow in Flanders

By Hilaire Belloc

BEFORE considering the details of the action fought during Tuesday, Wednesday, and Thursday last upon the British front, it is well to establish again the nature of the present position. Though we can forecast nothing of its future it is of the highest interest because at any moment it may become critical for the enemy.

The position is this: The Central Empires and their Allies have, all told, some ten million men in uniform, and rather over six million of them organised as fighting forces in the field. The balance, with the exception of all the men in depot, do not, and will not form any part of the fighting force either now or in the future. Of these forces the German Empire provides, as it has provided for many months past, one-half and most of the men in hospital.

It has 230 divisions in the field. Exactly how many men a German division counts on the average at the present we cannot tell to within a few units, but it is something under 12,000. The number of battalions of infantry which is included in a present German division is rarely more than nine, though there are a sufficient number of exceptions and independent bodies to bring the total number of battalions to 2,334, which is the present number of German battalions. Of these 2,334 battalions, 1,369 are upon the West against the French and English.

As to the exact average strength of a German battalion at this moment we, again, are not informed with exact precision, but we know it within fairly close limits, and we can say without grave error on either side that some 700 bayonets upon the average is very near the mark. In other words, the phrase a "German battalion" signifies to-day about $\frac{1}{10}$ ths the strength it signified during the first month of the war.

We then have about 950,000 German bayonets, but less than a million, upon the Western front. The mere statement of that number in connection with a line over 500 miles long and with the opponents it has to meet is sufficient to explain why the enemy now stands upon an increasingly anxious defensive. In material the handicap is still heavier—and the difference is increasing.

Now to this main aspect of the situation we must add a second—the enemy's anxiety upon the question of man-power for the future is also increasing. He happens for the moment to be passing through a temporary crisis which we must not exaggerate. He has nothing of class 1918 left in his depots, and he is only just beginning to bring into the field Class 1919, three-quarters of which have now had about four months training. This "bridge" between the two classes may provoke a momentary exceptional strain, but it cannot be permanent, and may be neglected. What is permanent and serious for the enemy is the fact that the rate of loss, as compared with his Western opponents—even excluding the Americans—is growing. It is probably not growing positively; but it is growing relatively to the corresponding loss upon the other side. The whole of the German class 1918 has passed through the fire this summer, while the corresponding French class has been in barracks the whole time, and is still in barracks, and not to be put into the field until later. Germany will already have lost many boys out of class 1919 through sickness, death, wounds and capture this autumn and winter before the French youths, a year their senior, come under fire at all. In other words, the German Empire, which was, only nine months ago, a year behind the French in men, is now a year and a quarter behind them. This comparison with the French shows nothing but the position against the most exhausted of the Western Allies. The position of the English and Italian recruitment is far more favourable.

Now, under these circumstances the enemy has been compelled to a strictly defensive policy. The thing is a necessary consequence of the general situation, and of what is properly called *politics apart* "the last phase of the war." It is no more than repetition to state it. It is obvious to every eye.

But a strictly defensive policy in the old days, when artillery was supplementary to infantry, meant something very different from what it means to-day, when artillery conquers and infantry occupies. Too much of our present conceptions of a defensive are based upon the old model, and we forget that a modern defensive line faced with the modern development and power of artillery, and of other mechanical and chemical contrivances which are but the extension of artillery, cannot stand fixed up to the breaking point as the old siege line did. It must give before it breaks, and it can postpone breaking point by making it self "elastic," it may save

itself from breaking by perpetual limited methodical retirement. Continued successive and comparatively small retirements, step by step, where there is ample space to play with, and where no grave political or strategical consequences follow upon retreat, is a policy which may conceivably be maintained for a very long time. But upon the Western front, the space with which the enemy can "play" is very limited, and both political and strategic circumstances severely limit his power of retirement without disaster. On the political side his great asset is that he is fighting upon foreign, and especially upon French territory. He is perpetually harping upon this "asset," and he has at this stage in the fighting the right to do so. It makes the task of maintaining internal discipline possible, and at the same time it enables him to work hard at the game of persuading neutral and even belligerent fools that there is a stalemate. So much for the Political advantage which his retirement would destroy. He would similarly suffer on the Strategic side, for his position in the West covers, but only immediately covers, certain of his main sources of supply in iron and coal, and a strip of the Belgian coast, which though not essential to his submarine campaign and his use of mines, is very valuable to the same.

Hold on Materials

Now, to retire even with elasticity, that is, without allowing his line to be broken, upon the salient in front of Ypres, and to do so with any rapidity, is to render very shortly his hold upon the sea-coast, and his hold upon Lille and the coal and iron to the south, impossible. If he merely stood up to each successive blow, lost the crescent it was designed to occupy, and so, week by week or fortnight by fortnight, went backwards, he would certainly be compelled to a general retirement before the end of the year, with all the tremendous consequences at home, in neutral countries and among the Allies, in material power and in moral of his army which that retirement would mean.

Let us see what alternative he has before him to regular and cumulative retirement of this sort.

He can do one of two things. He can make the progress of superior opponents difficult by holding his first lines in strength and by gambling against their withstanding most of the successful shocks delivered against them. That was what he did last year upon the Somme. The danger of pressure from Russia was then still considerable, but he was far better off in men than he is now, and in spite of the very great expense of this method he gambled upon it.

The gamble was successful inasmuch as it enabled him to hold out unbroken to the winter of last year, when the weather stopped the active offensive, but it compelled him to a very earnest, though futile public bid for peace in December, followed in March by an inevitable retirement. This retirement from the great salient of Noyon was not strategically disadvantageous, though politically he regretted it. It straightened and shortened his line and made him sacrifice nothing of material or strategic importance.

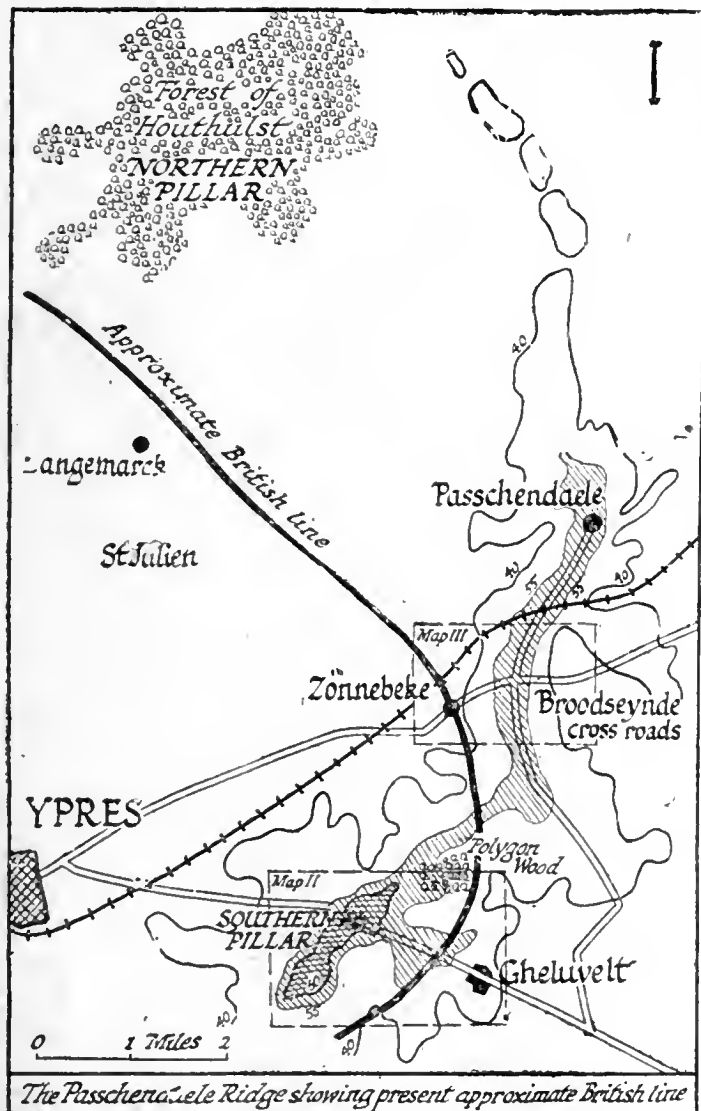

In the fighting of this summer and autumn he might have continued this method. He did not do so because the British superiority in guns and munitionment of every kind is now not only so great, but so rapidly increasing that what was dangerously expensive on the Somme would have been disastrous in Flanders. He has been therefore compelled gradually to adopt a new method. It is a method of numerous isolated posts which hold the front line with a minimum of men; of artillery drawn behind the front lines much further than it used to be; in other words, deliberately sacrificing the front line to the blow the opponent launches, but trusting to the power of the counter-attack to restore the position, or at any rate check his enemy's advance. The gamble here is upon the proportion of losses such a method may involve. The counter-attack has always been and always will be, but to use it in this particular way for the recovery of a belt of territory sacrificed is novel and tentative. You lose in yielding to the first blow men, material and moral—above all moral: you gravely risk much greater losses, if your counter-attack fails. The loss in material indeed is not very great. You do not lose guns as they were lost in the fighting of last year, but you lose men in quantities and your men lose heart.

Still, it is the only way left. Comparatively rapid yielding

of ground means the loss before the end of the year of all the enemy is yet fighting for. Short of comparatively rapid yielding of ground you have to choose between holding the front line densely, with the certain expense in men and in guns, and the present method with a fair security for the material and a gamble between bearable loss and very heavy and ultimately unbearable loss, according to the success or failure of your counter-attacks. The enemy has chosen the latter alternative, and it is pretty well the only course now open to him. What we shall see is whether it will enable him to save the sea-coast and Lille, and whether it will bring his resources in men to the breaking point or no.

The Action

Of all this the action fought last week was an example. Just before the British blow was delivered the enemy had attacked strongly north of the Menin Road as though to forestall what was coming, and had somewhat pressed back the British line at that point. But when the full strength of the blow fell this previous action of his proved useless. Five days had sufficed to prepare it—a very short interval, betraying the greatest activity in arranging the affair.

The Passchendaele Ridge showing present approximate British line

It was just after daybreak of Wednesday last, September 26th, that the new stroke was delivered by Sir Douglas Haig upon the gradually yielding defensive line of the enemy in Flanders.

Its capital point, as before, was the southern end of that crescent defensive position, the general name of which is the Passchendaele Ridge—that is, the southern pillar upon which the crescent reposes. Far more progress was made in mere space, in positions to the north where the advance carried Zonnebeke and established itself therefore upon the first slopes of the centre of the crescent. The vital point in all this, as in the actions major and minor of many past weeks, was still that southern pillar, the heart of which was cut out in the victory of the week before when the new defensive system was mastered by the new devices of the attack. It was against the British here that the enemy massed by far the greatest density of troops for his counter-attacks, and it is by the tenacity and success of the British pressure here that the whole action must be judged.

Familiar as my readers must be by this time with the details of this capital point, "the southern pillar" of the Passchendaele Ridge, I must beg leave to reproduce a map with sundry

new features in it which may make the effect of last Wednesday's action more clear.

Before the main attack launched in the terrible weather of July 31st and August 1st last, the German defensive organisation in this region consisted of a triple line.

There was first of all the "pie-crust," the advanced strongly enforced line upon which much the most of the enemy's labour has been spent during the past two years. It followed the western slope of the low heights which form what I have called the southern pillar and ran in a semicircle from the neighbourhood of Hooge round through, and then outside the southern portion of, Sanctuary Wood.

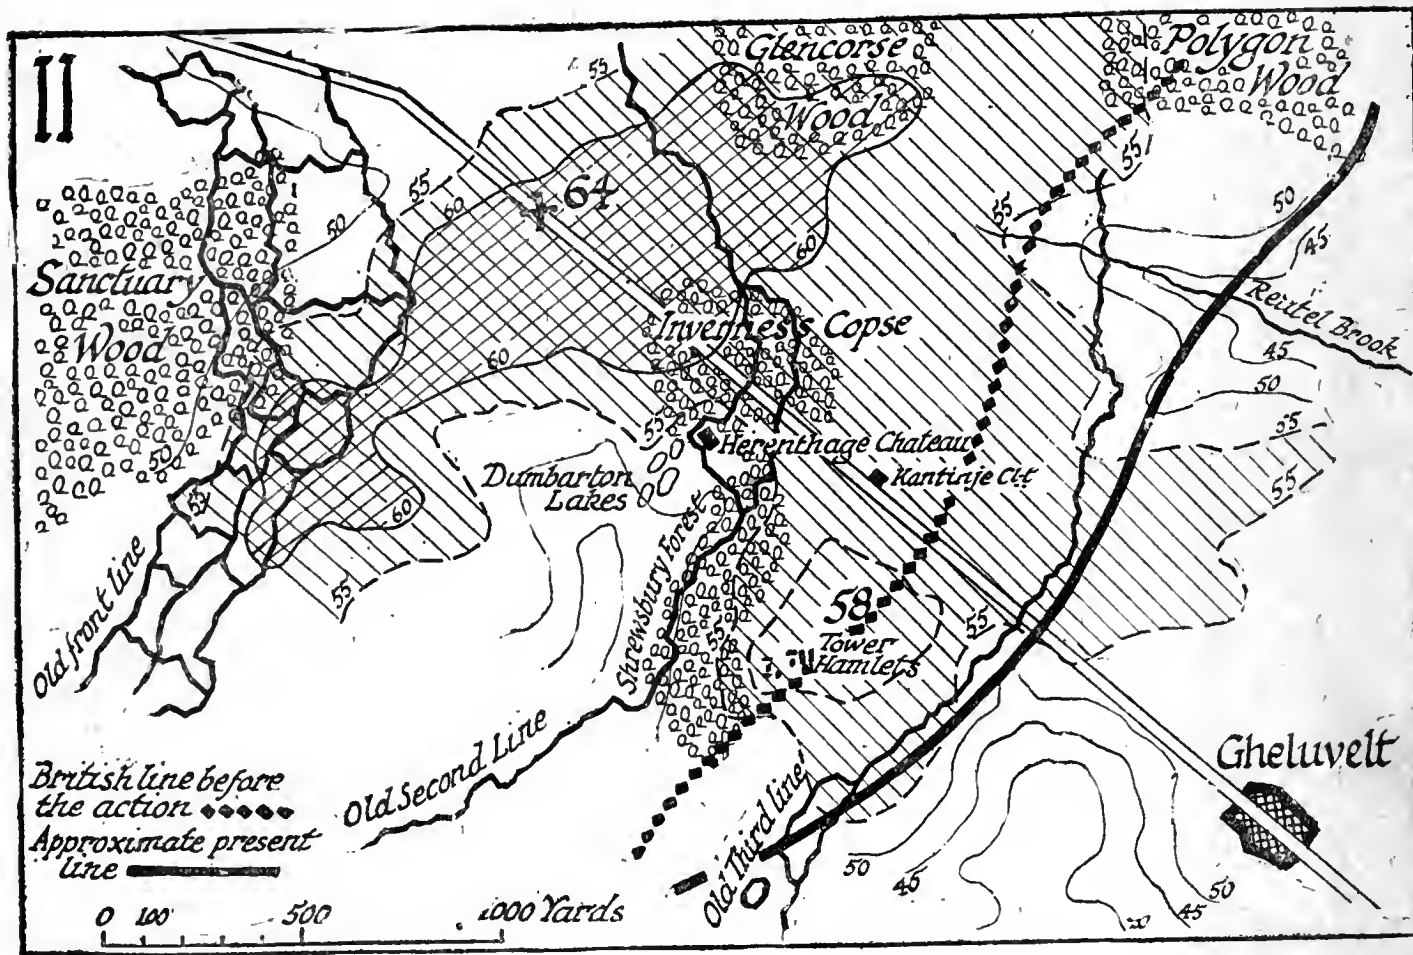

About a thousand yards behind this came the second line which in those days of continuous trenches upon the enemy's side was very strong, though not so elaborately organised as the front line; it covered Glencarse Wood, ran through Inverness Copse, used the ruins of Herenthage Chateau, and so curled round the wood which the British Army calls Shrewsbury Forest. The enemy had already abandoned the continuous trench system of defence here and was beginning to rely upon the new concrete isolated machine-gun points and the organisation of shell craters.

It was roughly upon this second line that the attack was held up during August and the earlier part of September, and it will be remembered what heavy fighting continued throughout all those weeks for the retention of the vital point upon the Menin Road, which is marked by Inverness Copse. The British forces yielded ground at one moment in this shattered wood, but never left the whole of it. The north-western corner was always held. Meanwhile, the new system of German defences held the greater part of the copse, Herenthage Chateau to the south of the road, with its sheets of marsh and water called "Dumbarton Lake," and the greater part of Glencarse Wood to the north of the road. The successful action of last week carried the whole of this old second line. It occupied Inverness Copse in its entirety, passed Herenthage Chateau, passed the ruins of the Kantine Inn, upon the fall of the road beyond Inverness Copse, entered the ruins of Veldhoek and reached and held the slight Tower Hamlets Ridge. In this position the British forces stood immediately in front of what used to be the old third line. This old third line was no longer, of course, a continuously held trench position, because, as we have been told, that system had been given up by the enemy. It none the less marked the string of defensive positions which the enemy had constructed and roughly corresponded to the line of resistance which had next to be carried. It ran, as will be seen upon the accompanying map, from the south of Polygon Wood, through Carlisle Farm, just east of Velhoek, crossed the Menin Road about 500 yards below or eastward of Kantine Inn and then ran along or just above the 55 metre contour which marks the eastern slope or shallow escarpment of the Tower Hamlets Ridge. It was this chain of posts which was attacked at dawn of last Wednesday, the main weight of the attack being developed north of the road in front of Velhoek.

Details of the Action

In the first thrust the works on the eastern slope of the Tower Hamlets Ridge, on the extreme right of the attacking line were seized and held, and a strong counter-attack directed from Gheluvelt was defeated. To the north of the road the struggle lasted all day and was exceedingly severe, and the full result was not known in London until the morning despatch of the next day, Thursday the 27th, in which we were informed that the counter-attacks in this region had broken down and that all the British gains were held by the English, Scotch, Welsh and Australian troops concerned. This fighting between the Polygon Wood and the Menin Road was marked by many striking incidents, the chief of which was the isolation, some time before the main thrust was delivered, of two companies of the Argyll and Sutherland Highlanders, who held out until they were relieved by the advance of the Wednesday. In the course of Thursday night the enemy voluntarily gave up ground which he was trying to hold upon the little stream of the Reutelbeck, south-east of Carlisle farm, and thus admitted the defeat of his efforts. It was remarked that the enemy losses in these very heavily weighted, but happily unsuccessful attempts to recover the lost positions, were exceptionally severe.

Such was the story of the fighting which carried the last slopes of the "Southern Pillar" and brought the British forces to the outskirts of the ruins of Gheluvelt. Meanwhile, the battle extended up northwards for another five miles and scored considerable territorial results. Immediately to the north of the important obstacle Polygon Wood was carried by the Australians in its entirety, including the very difficult and strongly organised point of the Butte or mound in the N.E. corner just beyond the racecourse. The Australian

troops, reaching the open country to the east of the wood, were subjected to counter-attacks of great violence, the last of which was preparing as late as the morning of Friday the 28th, when it was caught under British artillery fire and broken up. None of these counter-attacks succeeded.

Further to the north again came the chief advance of the day, the capture of the ruins of Zonnebeke, and the establishment of the British line upon the first slopes of the Passchendaele Ridge proper. At this point, however, the German counter-attack somewhat thrust back the line, leaving the British troops on the evening of Thursday, the 27th, in possession of the ruins of the chateau, of the church and of the cemetery; but, according to the accounts received from the newspaper correspondents in the London Press of Friday morning, not carrying the ruins of the station which were still in German hands. North of Zonnebeke all the objectives were reached and held. The defensive here was in the hands of Saxon troops. The attack appears to have been delivered by British troops from London and from the Midlands. A violent artillery fire modified the line here for a moment, but it was restored by the Londoners before Thursday night.

The Present Line

The line through Zonnebeke would seem to run, at the moment of writing, so far as its position can be gathered from the Press correspondents of the London papers, somewhat as it is marked on the accompanying map.

It will be seen that Zonnebeke lies at the foot of the Passchendaele Ridge, which rises up immediately above it by a bank some fifty feet in height. The central point of the village is the place where the by-road from the station comes into the main road near the church. The main road thence goes in eastward up the bank to the summit of the Passchendaele Ridge, where there is a lump rather higher than the rest and near it the ruins of a windmill. Where the main road crosses the road to Passchendaele (which roughly follows the summit of the ridge) you have Broodseynde cross-roads with a couple of ruined cottages to mark it, and that point commands all the flat country beyond. All the plain of Flanders to Brabant lies almost uninterrupted to the view from this insignificant elevation at the foot of which the British forces now stand in the ruins of Zonnebeke. The Germans, so far as one can gather from the newspaper correspondents, still hold the station and probably the slightly higher ground (Hill 40) just beyond. The British hold the central point of Zonnebeke and the western half of the ruins. They are overlooked from the rising ground beyond the eastern half which the Germans retain.

The total number of prisoners counted after the action was

somewhat over 1,600, but this is but a slight indication of the very heavy losses which the enemy on the unanimous testimony of our own observers and his examined prisoners suffered. The density of the counter-attacks which failed was particularly remarkable, and was responsible for the greater part of this loss. No less than four divisions, for instance, were identified first and last in the heavy work in the shallow Rentelbeck depression, between the Polygon Wood and the Menin Road; while the total number of divisions which have had to be withdrawn from action on the German side, from the attack

of last week to Thursday night last, would seem to be no less than ten. The French have remarked in particular how near the advance now is to outflanking the great Houthulst Wood, which is the northern pillar of the German defensive position. This is true, but that northern pillar will lose its local importance in any case when or if the main ridge is carried. If the enemy has to retire before winter on to the flats beyond, and if he is observed by his opponent from the heights of the Passchendaele Ridge—the last ridge in this part of Flanders—his retention of the Houthulst Forest will not, so far as one can see, have any further advantage for him. It will simply form a large awkward salient with no particular value attaching to it.

The Political Factor

In the opening of this article I spoke of the enemy's strategic and material position, including his position in manpower, and mentioned the effect of all this under the qualification of *politics apart*. But to that enormous qualification I must return.

The enemy's waning strength, the certitude of his defeat, the preponderance over him of his opponents—all these are what they have been described not only in these columns but by every competent authority for some time past. But such calculations take for granted the permanence of the political situation; it is precisely upon the break-up of that political situation that the enemy counts to-day in an especial manner.

He has counted upon it, of course, in general, and has worked towards it, ever since the Marne; but since the Russian Revolution, and especially since the effects of that Revolution, in the military collapse of Russia during the present summer, he is dependent upon the political factor for a measure of success such as last year he never hoped to attain, and the whole of his action, not excepting the campaign by sea, turns upon political calculations.

Let us tabulate these to see them more clearly.

(1) The enemy counts upon the divergence of aims between the various Western Allies and in this divergence of aims must be included the difference in national characters, traditions and experience.

(2) He counts upon the lassitude, ignorance and confusion of the civilian population as regards the war, apart from other domestic difficulties.

(3) He counts very much upon internal divisions, especially in highly industrialised countries and districts where the quarrel between the wage-earning workers and the Capitalist owners was already acute before Prussia and her Allies challenged Europe to war.

These are the three main divisions of his political calculation—and it is a formidable one, full of menace to our future. The Russian Revolution has given it a character it never had before, for the Russian Revolution has shown every one of these three points in a high light. It has shown how different were the national traditions and ideals of the East from those of the West. It has shown what enormous effect lassitude, ignorance or confusion can be upon the population at home, and it has shown what can be done by the enemy when he works upon domestic hatreds and divisions.

If we do not appreciate these three main engines which are calculated to counteract his desperate military situation, we shall not understand either why the enemy is still so confident or what good grounds of confidence he has. We shall fail, therefore, to master his policy.

(1) The divergence between the various Allies, even between the various Western Allies, is clear enough. It is first apparent in the matter of *aims*. The French, for instance, are fighting in an old quarrel of theirs and for the recovery of territory which had been taken by force, colonised by the enemy and erected by him into a formidable economic support of his military power. The English are fighting for moral and material things necessary to their existence; the respect of neutral territory in Europe, particularly of the North Sea Coast; the security of supply by sea; and the prevention of one Power's arising to mastery upon the Continent. The Italians upon their entry fought for strictly national aims; the retention of lands which were morally Italian, and the historic claim that the Adriatic should be Italian in control. The Americans, when they entered, entered because their sovereign rights had been directly challenged by the German claim to sink their neutral ships without warning and to murder American citizens at will.

These differences are quite clear and on the surface, but if we are wise we will consider other differences far more important, which are of national tradition, experience, temperament and even morals, which are too often glossed over in the natural desire to avoid friction.

It is a matter of life and death, for European civilisation at any rate, that the war should be won, and it will not be won unless we resolve these frictions or at any rate understand their quality. Even as I write, I find in a paper which has reached me from America, a Pacifist organ appealing to the academic classes of the Eastern States, and professing sympathy with Western Europe—*The New Republic*—an astonishing plea in favour of the German Empire remaining, not only strong after the war, but in full possession of Alsace Lorraine, with the exception of the district round Metz. I open an English paper and read of the debates in the French Parliament exactly as though it were an institution like the English Parliament, aristocratic in origin and deep-rooted in the popular tradition of France, instead of its being the recent and exceedingly unpopular experiment which it is in that country. It is a little as though a Frenchman were

to write of the London County Council twenty years ago, in the days of Mrs. Ormiston Chant, as the political soul of London. I open a French paper and I note the Labour Party taken as the representative of the mass of the English wage earners, and the absurd Pacifists of that party as in some way representative of the English workmen.

These are but a few obvious examples of the differences between the various Allies. The fact that the right of reprisal is being debated in this country at all, is another example. The fact that one of the Allies has suffered invasion still another; the fact that London is frequently raided from the air, while Paris is nearly immune; the fact that the whole weight of the submarine campaign falls upon this country and is only indirectly felt in others; the fact that Great Britain is almost entirely industrialised, while France and Italy are largely agricultural States; the fact that Great Britain depends so largely upon direct taxation for financing the war, compared with the postponement by our Allies of this burden—these and one hundred other contrasting points will occur to the reader. The marvel is not that so general a congeries of nations mustering something like half the strength of the world against the other half, should display these differences, the marvel is rather that the Prussianised German, by his bestial actions, and proclaimed anarchy in morals, should have called such an Alliance into existence.

Civilian Feeling

(2) The lassitude, ignorance or confusion of the civilian population includes, not only the natural weakness consequent upon three years of war, nor the ignorance in which one population may stand of the lightness of its losses, compared with those of an Ally, but also the inability of great bodies of men to grasp the lessons of the past. We repeat constantly (in all the Press which counts in this country) that this war is a war of life and death. It is not a rhetorical expression. It is an expression strictly true. Those who know upon what the greatness of England has been founded and what her position has now been for over 200 years in the story of the world, know that a negotiated peace is the beginning of a rapid decline for England as certainly as they know the laws of the physical universe. The mass of the population, especially in a Parliamentary country, is not only ignorant of such a past and of its causes, but has been, as a rule, misled with regard to them. Its instincts are none the less sound, but they are instincts alone, and if forces in favour of the enemy (or of a negotiated peace, which is the same thing) are allowed to play upon the popular ignorance, the consequences may be fatal. It is at this disarray of the popular feeling that the enemy aims. The petty bombardments of London certainly have no other object, and even the campaign against shipping by submarine and mine is now mainly directed with this object in view. None of the directors of German policy can by this time believe that the destruction of shipping will decide the war, however grievous its effect upon our comfort and sense of security. What they do believe is that its continuance may so affect civil opinion as to make a successful prosecution of the war ultimately impossible. In this category of lassitude and confusion one may properly put the enemy's dependence upon international and cosmopolitan finance. Not that this part is confused or ignorant. It is, on the contrary, very well informed, cunning and acute. But its impatience with the continuation of the war works along the same lines as all other forms of impatience and misconception and indifference upon the arms of Europe.

(3) Lastly, the enemy counts upon civil differences in domestic events within each country and particularly upon the difference between the possessors and the wage earners in the industrialised countries and districts. He has had here some measure of success. He counts upon a much greater measure. It is interesting to see by what methods he has himself checked though not destroyed similar tendencies within his own boundaries. Universal conscription without exemption or with exemptions in rotation is one of these methods, but the most powerful of all has been his policy of interfering as little as possible with the domestic habits of the people. I think it may be justly said that during the whole war there has not been in the Central Empires any restriction that was not imposed with the direct object of winning the war, and which was not so clearly connected with that object as to be apparent to all. The same cannot be said of ourselves.

This brief review of the political forces upon which the enemy depends for arriving at his object of a negotiated peace, is no more than a summary of their names. It pretends to no analysis of their causes or their working; still less to any constructive remedy for the evils they threaten. One can only

say in the presence of such a peril that it is the duty of everyone who sees what a negotiated peace would mean—and most educated men see it—to withstand by every means in their power the progress of lassitude and of disaffection, and to resolve by every means in their power the inevitable differences of temperament and tradition between the Allied peoples. The discussion of those points which interested us in the days of peace is futile to-day. Equally futile is mutual recrimination between conflicting interests, however sharp their conflict. The whole task and the only task is to win

the war. *And winning the war means the imposition by force of arms upon the German people and their Allies, of the conditions imposed by European civilization: not the persuasion of the German people to an acceptance of those conditions; that would be worthless. Nor a document merely registering those conditions that we know from repeated Prussian declarations and actions would be disregarded. The German never keeps his word. But Victory imposing these conditions, with the weight of guarantees held by the victors. Short of that, the war is lost and we are lost.*

Ramadie

The victory in Mesopotamia achieved by Sir Stanley Maude last Friday and Saturday is of first class importance. The news has come in late and I can only deal with it very briefly this week.

It would seem, so far as we can judge from the first news alone, to have this character:

The enemy can attack by two roads, and with two lines of supply behind him. The first line of supply is the Valley of the Euphrates, nourished from Aleppo, which is the nodal point of all near Eastern strategics. He can also attack down the Tigris Valley, indirectly nourished from Aleppo, but only after a tedious journey across country from the Tigris and necessarily based to some extent upon his existing stores and magazines in the mountains of Armenia, where, before the Russian invasion, he had his principal concentration to meet the successful armies of the Grand Duke Nicholas.

He apparently intended to attack the British troops holding the area of Bagdad by both routes. He would strike from the north along the Tigris, whence he would get most of his men and a sufficient supply. He would strike from the east where his forces were probably less considerable, *but with an ample supply*, because there is no direct transport down the Euphrates from the railway, which reaches and crosses that river, whereas it does not reach the Tigris.

At any rate his plan appears to have been this double and converging attack. Sir Stanley Maude's victory of last Friday forestalled this plan by restoring on both sides the advanced base of the attack from the west along Euphrates. The Tigris and Euphrates rivers are at their nearest in the region of Bagdad. The road westward to Aleppo from Bagdad runs to a point called Feludja, some 35 miles from Bagdad. To the north of this road goes the telegraph line, to the south of it a railway.

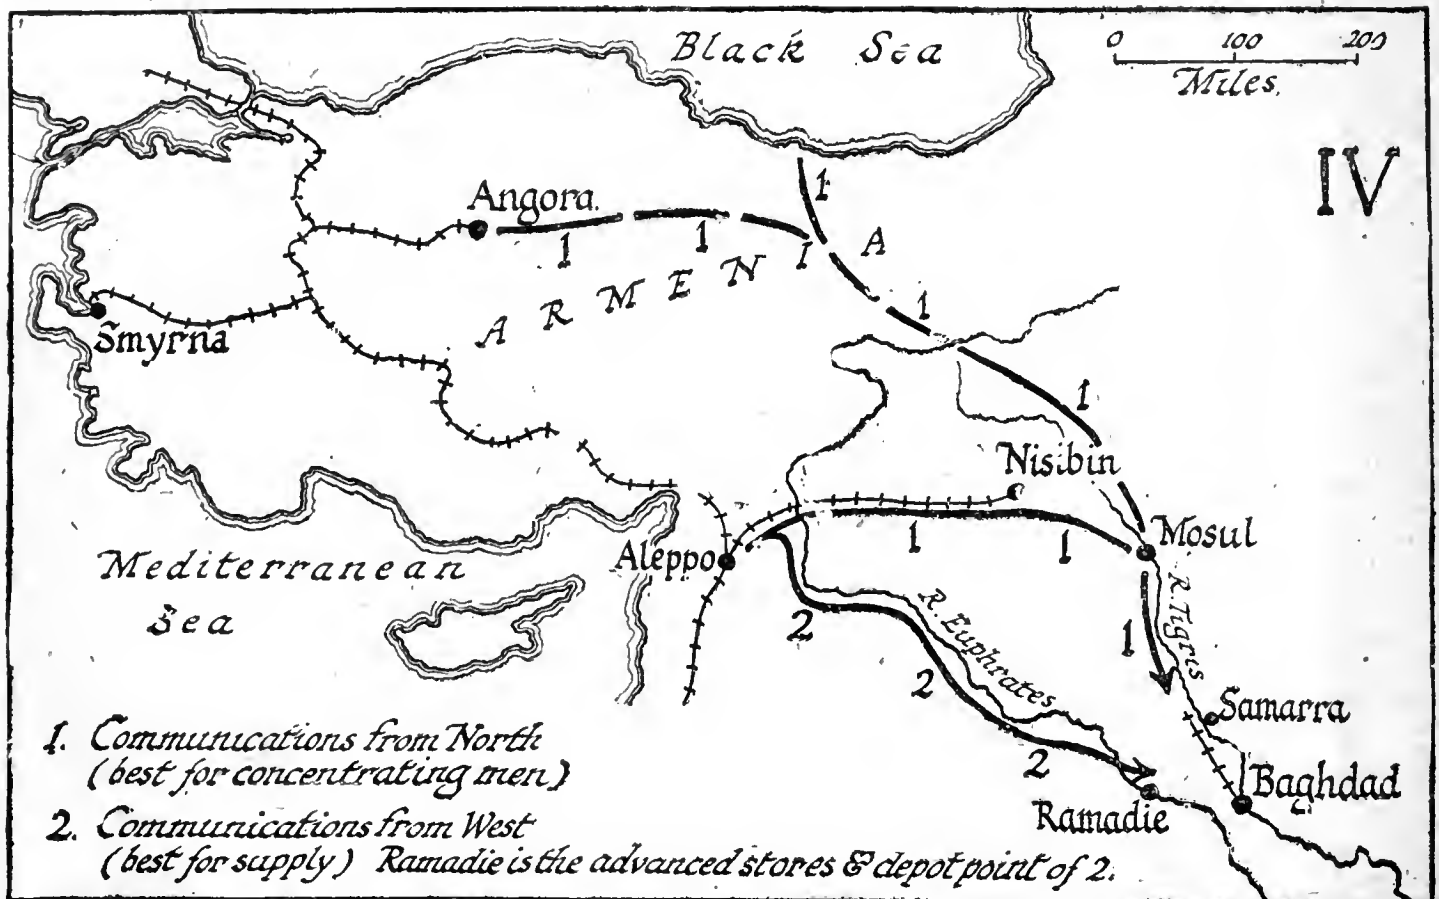

Feludja is on the eastern or Bagdad side of the Euphrates. There is a large bridge of boats at Feludja crossing the broad, very rapid, and difficult stream. Beyond the stream the railway ceases and the telegraph and road run together, south of the river and between it and the big marshy stream of water called the Habbaniya mere. This shallow lake and marsh

drain into the Euphrates by a water-course which comes in at the point of Ramadie—four miles to the east of this is Mushaid. At Ramadie the General commanding the main Turkish force, Ahmed Bey, and his staff, with a considerable garrison, were awaiting the moment to advance. At Mushaid was an advanced post. The great success which followed was obviously due to surprise, that one necessity of decision. The British Force reached the bluff which stands to the south of Mushaid, overlooking the river, on the evening of Thursday last, September 27th, and established contact with the enemy. It is clear from what follows that the enemy expected no such movement. The left of the British line attacked Ramadie from the south-east, and meanwhile the cavalry, having crossed the watercourse, established themselves on the road to the west of Ramadie. By some time on Friday, therefore, the main Turkish force lying at Mushaid, on the road behind it towards Ramadie, and at Ramadie itself, was completely encircled. The British contained it to the east, to the south and to the west. On the north ran the river.

During the night an attempt was made by the enemy's forces, thus trapped, to break out up the Euphrates by the road westward. The British cavalry was already there and stopped this attempt, and at nine o'clock in the evening of Saturday the encirclement was so apparent to the enemy that he was compelled to surrender, though under what conditions, whether of negotiation or by the storming of his last defences we do not know at the moment of writing—the evening of Monday, October 1st. Sir Stanley Maude reports that the fighting of Friday was very severe, including, presumably, as it did, the carrying of the enemy's field works drawn to the south east of Ramadie, eastward of the water-course. We are informed in the despatch that much material and several thousand prisoners fell into British hands, as well as the Turkish general in command and his staff, but there is no enumeration as yet of these captures.

Those interested in military history will note the parallel between this brilliant piece of work and the manœuvre of Rivoli—allowing of course for the difference of scale.

H. BELLOC

American Influence in the Balkans

By Lewis R. Freeman

The influence which the returned American Emigrant exercises in the Balkans is explained in this article. With America a part of the Alliance, and taking part in European affairs, this influence may in time increase enormously.

IF the Kaiser were as surprised at America's entry into the war as was his royal brother-in-law King Constantine of Greece, there must indeed have been consternation in Potsdam last April. For the misguided Tino, whose prestige with his own people had been at its zenith in the four months following the discomfiture of the French in their attempted coup of the preceding September, the coming in of the United States marked a turning point, and from that time on things steadily declined until his abdication in June brought to an end one of the most disgraceful reigns in the whole miserable history of the Balkans.

That the Greek Royalists had built high hopes on some kind of help from America, there is every indication. I arrived in Greece at the end of last March, and before I had begun to unpack in my Athens hotel, an official from the Foreign Office called to say that he had been advised from Italy of my intended visit, and that, in pursuance with King Constantine's desire to keep the American public informed regarding the motives impelling him to the course he had followed in his relations with the Entente, His Majesty was prepared to grant me an interview at some mutually convenient time the following week.

As there was some doubt in my mind as to whether or not an interview would be of interest to any of the periodicals I represented, I suggested that no definite audience be arranged until I had time to cable for instructions. Before I had even secured permission from the Allied Military Control to send the cable, however, word was flashed through that America was throwing in her lot with the Entente, and scarcely had this information been published when my previous caller hurried over to see me again. He was one of the most surprised and indignant men I have ever met.

"We didn't expect *this* was going to happen when we arranged with His Majesty to see you," he whined angrily. "There were many things we wanted to make the Americans understand, much that we expected to have them do for us when they knew the real facts about the perfidy of Venizelos and his traitors; and — But what's the use? It's finished for good now."

A Rare Distinction

After telling me that there was no longer any reason for the interview with the King, he stamped out, with a parting sneer to the effect that, if America wasn't going to be of any help to Greece, there was at least the consolation that she had not it in her power to be of any more help to the Allies than she had been all along. To the Allied diplomats in Athens it had long been known how fully and irretrievably the Royalists were committed to Germany, but this was my first experience of it, and it was scarcely less staggering than enlightening. As a consequence, however, I gained the distinction of being the only journalist visiting Athens in the period of Constantine's "exaltation" following his "victory over the French," who did *not* have an interview with him.

Constantine, whom on the evening of my arrival I had seen driving through the streets and acknowledging the greetings of his misguided people with the jauntiest of salutes and the gayest of smiles, was one of the most dejected figures imaginable on the glad occasion of the Royal Te Deum in the Cathedral on Greek Independence Day, April 7th. His abnormally protuberant forehead was wrinkled in a sullen scowl throughout the whole imposingly beautiful ceremony, and not even the vociferous "Zitos!" (Vivas) set going by picked groups of his hirelings scattered through the crowds drew more than the most perfunctory nods from him or his equally crestfallen consort on the "triumphal" drive back to the palace.

At this time partisans of M. Venizelos were going about in fear of their very lives, and the only individual I came across who dared to give any outward expression of the renewed hope stirring inwardly as a consequence of the action of the United States was a man in an obscure street who had lashed the Stars and Stripes to the top of his barber's pole. Most of the passers-by doubtless thought that the two red, white and blue insignia were intimately related to each other, and it was probably lucky for the doughty barber that he displayed the Stars and Stripes somewhat "camouflaged." But when I pushed inside to ask him if it was a

coincidence that the wrinkled bit of bunting was out on the same day that America's entry into the war arrived, he made no effort to hide his real sentiments.

"Bet yer life it ain't by chance," he said stoutly. "I cut hair on the ol' Bow'ry for sev'n years 'fore I beat it back to this d— d hole. Nope, ain't a 'Merican cit'zen; but yu take it frum me I'm goin' tu be if they don't fire this hull big bunch o' cutthroats—King an' all—out o' Greece on the doubl'. I brot that flag all the way from lil' ol' Nuyork with me. To-day the first time I gets up the nerve tu put it out; but now it is out, by—, it'll stay ther' till they cum an' shoot it down. An' maybe they'll start more'n they're lookin' fer if they duz that."

As the high-handedness of Constantine's *agents provocateur* in Athens steadily declined from the moment of America's entry into the arena, I should not be surprised if that saucy bit of red, white and blue-bunting were still flapping from its queer flag-pole when Venizelos returned in triumph to the Greek capital three months later.

Returned Emigrants

One meets many returned emigrants from America in all parts of Greece—as everywhere else in the Balkans—and it is an interesting fact that every one of those whom I encountered at this crucial epoch in Hellenic history was a most staunch Venizelist and intensely bitter against Constantine and the whole Royalist regime. A family who gave me shelter for a couple of days in a little village on the slopes of Mt. Olympus, in the course of my precarious journey by land from Old Greece to Salonika, furnished a fair example of the discriminating attitude adopted by even the most ignorant of these as a consequence of their "spell of freedom" across the water. Five brothers of this patriarchal establishment had spent from four to eight years apiece working in the mines and smelters of the Western States, and all of them had eventually returned to invest their "fortunes" in sheep and goats and to become "leading citizens" of the cliff-begirt little Olympian village of Leptacara.

The eldest brother had erected a small café and rest-house at the temporary terminus of the railway line, which he had named "Hotel Tacoma," in honour of a more pretentious hostelry in the last town he had worked at in Washington. He celebrated the arrival of the first "reel 'Merican" the village had ever known by "shouting the house" in true Western mining camp fashion. After everyone—shepherds, fishermen, section-hands, the station agent and two soldiers in Royalist uniform—had been provided with a glass of *mastic*, he proposed the toast to "Pretty soon 'Merica come fight for Greece." Then I stood a round to "Pretty soon come back Venizelos," which a second one of the returned brothers followed with "T'ell wi' Constantino!" The last toast was so popular that it would undoubtedly have been drunk repeatedly had not the end of the *mastic* put a period to the international amenities.

Grimly tragic was another occasion on which I heard a returned Græco-American curse his traitor king with what must have been not many removes from his dying breath. It was toward the middle of last June that I entered Janina on the heels of the Italian Army, to find the people of the loveliest of all Epirus cities in the last stages of starvation. The rich valleys above and below the town had produced food enough to feed its 20,000 inhabitants four or five times over, but the Royalists, in provisioning Athens against the punitive blockade of the Allies, had transported to the capital all the corn they could lay hands on. The inevitable sequel was one of the saddest of the war, and I must confess that I have been scarcely more stirred by the streams of wounded draining back from Verdun and the Somme than by the sight of the ghastly dead and dying—men, women and children—lying indiscriminately on the sun-hot cobbles of the streets of Janina and in the shade of its incomparable plane trees.

It was just at the edge of the public square that my car was brought up sharp to avoid running over a poor fellow who had collapsed in a heap while trying to wheel out of the way a push-barrow on which were stretched the emaciated corpses of a man and woman. He dragged himself to his knees by clawing up the smoking radiator of the big Fiat, and—noting that my uniform was different from that of the Italian officer at my side—asked if I spoke English. When I jumped out, lifted him to his feet and told him that I was an American, he almost choked with excitement.

"I was contractor—Cheyenne, Wyoming—f'r ten years,"

he gasped brokenly. "My broth'r there"—jerking his head toward the body of the man on the barrow—"was with me. Made plenty money. Came back here an' bought big farm. We—rich men here—plenty corn an' sheep—much land—all we want. This year good crop—fine prospect. Then Constantino send soldier—take all—cow, sheep, goat, corn—not pay nothing. Three months just little corn an' roots to eat. My mother die—then my wife—then my boy and girl. Yest'day 'Talian come—bring plenty bread, plenty rice. But we eat too much. Stomach no good. Last night my brother an' his wife—both die. I very sick—very weak. You tell 'Mericans—we—I—Oh, God damn Cons'tino—"

He slid down into a limp heap at my feet. We put him in the car and carried him to the little hospital the Italians had reopened in Ali Pasha's old fort, where, though we managed to get him attention ahead of the hundred or more similar cases that were waiting, they told us there was little hope of pulling him through.

Nothing could have thrown a better light on the circumscribed political outlook of the Balkan peoples than the fact that not only the inhabitants of the primitive villages, but also many of those who had spent a number of years in America or England, invariably seemed to take it for granted that the entry of the United States into the war would immediately be followed by the despatch of troops to help to attain whatever happened to loom in the mind of this or that individual as the most necessary end.

An Albanian I encountered in Koritsa, who had earned enough driving an express waggon in Brooklyn to return and set up a knick-knack shop in his native town, was convinced an American army should be landed at Valona for the purpose of pushing the Austrians out of all of Albania and setting up a National Government at Scutari. Similarly, a Macedonian Vlah, whom I chanced upon in the course of an evening walk in the hills above Florina, superintending the milking of the flock of sheep he had bought with money saved from the profits of his coffee-cart in Baltimore, felt that the first thing an American force should do would be to drive the Bulgars so far north that there could not be any repetition of such air raids as the one which wrecked his house and killed his best dog the previous week. A Serb, who did my washing at Scochivir, had no doubt that the American Balkan army should fight its way north from the Cerna Bend, while one that cut my hair at Banitsia was equally certain the Yankee advance had best be made up the Vardar. The reason for the "strategy" of each I understood when I discovered that the home of the first had been in Preleip and of the second in Ghevgegli.

The Bulgar

If the truth were known I think it might well turn out that, of all the Balkan peoples, the Bulgar was the one most impressed by the entry of America into the war. Of all Bulgarian overseas emigrants ten went to the United States to one to any other country, and in the exaggerated imaginations of these and their friends, America constituted just about all there was of importance in the whole outside world. The actual significance of President Wilson's action could not possibly have spread very rapidly in Bulgaria, and yet even by the middle of May there had been a noticeable increase in the number of Bulgars deserting to the British armies on the Struma and Vardar, an increase which the Intelligence Officers had traced directly to the entrance of America.

"It is a remarkable fact," a British officer engaged in interrogating prisoners said to me, "that of recent Bulgar deserters, fully fifteen per cent. have been in the United States at one time or another, and the number of the latter is on the increase. These ignore completely the technical fact that their country is not at war with the United States, and say simply that they do not want to fight against America, and that they laid down their arms just as soon as they had a chance."

The French, Serbs and Italians were also reporting increased Bulgar desertions at this time, and it was at a prison camp of the latter near the Cerna that I had the opportunity to talk with a genial cobbler who had once worked in Fall River, and who, with his shoe-making tools under his arm, had sauntered over from the Bulgar lines the week before. He had come home, he said, to fight Serbs, not Englishmen, Frenchmen and Italians. He had been trying to screw up his nerve to desert for some time, but hadn't got it to the sticking point until a friend—another returned Americansky—had picked up a paper dropped from an aeroplane saying that America had joined the Allies. Shortly afterwards, taking advantage of the confusion following the sniping of an officer, he slipped out of a sap and over to the wire in front of the Italian trenches without being missed. He was in hopes, he said, of being turned over to "the American Army," and being sent to a prison camp in the United States, adding

naively that, while the Italians were very kind to their prisoners, he did not feel it was right to keep them there where it was so exposed to air raids.

"What air raids?" I asked. "Bulgar," he replied, adding that only two nights before bombs intended for the "dump" and hospital had struck right in the midst of the prison-camp, and that if he hadn't been in the big dug-out he would have been killed.

American Flags

In all Salonika at the time of my visit there were only three American flags, one belonging to the Consulate, one to the Standard Oil Company, and one to a Mission School about five miles out in the country. Naturally, the starry trio were in great demand for all international functions where it was desirable that honour should be done to all of the Allies, and there was usually a considerable waiting list for each of them. Still more in demand was the lone copy of the music of the "Star Spangled Banner," which they never did, I believe, succeed in expanding sufficiently to make it go all the way round a full band. "America," to the air of "God Save the King," was the commonest substitute; but I also heard "Yankee Doodle," "Dixie," and once—by the Serbian band, on an especially formal occasion—"My Home in Tennessee."

The Jewish tailors in Salonika began turning out some very fearful and wonderful substitutes for the "Stars and Stripes" before long, the cheapest of these being made by painting red the light blue stripes of the old Greek flag and stitching a starry rectangle—likely to be of any colour—in one (and not necessarily any particular) corner. As an "improvisation," however, I am confident that no American flag since the first patch-work original has been worthy of mention in the same breath with the amazing banner which was thrown to the breeze of Mount Athos on the occasion of my visit to one of the monasteries of that strange mediæval community.

As the first American to go to Mount Athos after the entry of the United States into the war, the kindly but simple Monks saw no absurdity in arranging another of just the same sort of "triumphal tours" with which they had been welcoming French and British Admirals and Generals. This included a Te Deum for my soul in the ancient church of a monastery, a reception by the House of Parliament, and a series of formal banquets in various parts of the Peninsula. There were Allied flags in abundance on all occasions, but it was not until the concluding feast at the rich and beautiful monastery of Lavra that the resourcefulness of the monks succeeded in supplying the much-lamented lack of an American flag.

The banner which greeted me at the little spray-wet quay and was carried at the head of the procession up the winding road to the monastery gate was a most imposing one, and I was especially struck with the bas-relief effect of the three or four snowy stars which peeped out between its ample folds. There was only one fault to find with it—it would persist in drooping and only wriggling snakily in the breeze—that was snoring up from Gallipoli-way at a pace to set the other flags in the procession whipping to tatters. Why this was I did not understand until after it had been brought up to the banquet hall and spread proudly out—with a monk at each corner—for my inspection. Then it transpired that the red stripes had been stained with raspberry jam, the cerulean background of the stars with gooseberry jam, while the stars themselves were nothing more nor less than starfish, gathered at low tide, baked stiff in an oven, and whitewashed!

When the German Reichstag was opened yesterday week, its President, Dr. Kampf, delivered a vigorous speech attacking President Wilson for his letter to the Pope. "President Wilson," he said, "repeats the old assertions of the ambitions and intriguing attitude of our Emperor and our Government, which nevertheless, as is known to us all, maintained the peace of the world for forty-three years in spite of all provocations."

Dr. Kampf concluded his speech thus: "To the German people, for whom President Wilson feigns to cherish so much friendship and so great sympathy, he has flung into their faces the worst insults which have ever been inflicted on any people. We are speaking in the name of the whole people when we decline such interference. We repulse in the strongest manner the attempts to create dissension, because Germany is sufficiently capable of ordering her affairs herself, and, indeed, to order them in such a manner as corresponds with German needs and the character of the German people. At the fronts, whence a large number of our members have just returned, we have been able to admire the heroism of our incomparable soldiers, officers, and generals, who with iron stubbornness and unbroken spirit of attack have daily accomplished the superhuman for more than the past three years. We were able to observe the magnificent order accomplished by the German General Staff. We were amazed again and again at the magnificent accomplishments of our Chief Army Administration, who, even in battles of defence, is never found wanting." The phrase "even in battles of defence" is illuminative. The speech was received with applause.

A Journal from a Legation

By Hugh Gibson (First Secretary of the American Legation in Brussels)

In this last chapter from "A Journal of a Legation," Mr. Hugh Gibson describes Louvain, when the burning, pillage, and massacre were actually in progress. The full story cannot be told until after the war, but enough is set down to establish that the horror of Louvain was deliberately planned by the German General Staff and approved by the Kaiser.

BRUSSELS August 27th, 1914.—There is bad news from Louvain. The reports agree that there was some sort of trouble in the square before the Hotel de Ville a day or two ago. Beyond that no two reports are alike. The Germans say that the son of the Burgomaster shot down some Staff Officers who were talking together at dusk before the Hotel de Ville. The only flaw in that story is that the Burgomaster has no son. Some Belgians say that two bodies of Germans who were drunk met in the dusk; that one body mistook the other for French and opened fire. Other reliable people tell with convincing detail that the trouble was planned and started by the Germans in cold blood. However that may be, the affair ended in the town being set on fire and civilians shot down in the streets as they tried to escape. According to the Germans themselves the town is being wiped out of existence. The Cathedral, the Library, the University, and other public buildings have either been destroyed or have suffered severely. People have been shot by hundreds and those not killed are being driven from the town. They are coming to Brussels by thousands and the end is not yet. This evening the wife of the Minister of Fine Arts came in with the news that her mother, a woman of eighty-four, had been driven from her home at the point of the bayonet and forced to walk with a stream of refugees all the way to Tervueren, a distance of about twelve miles, before she could be put on a tram to her daughter's house. Two old priests have staggered into the Legation more dead than alive after having been compelled to walk ahead of the German troops for miles as a sort of protecting screen. One of them is ill and it is said that he may die as a result of what he has gone through.

A Column of Grey Smoke

August 28th.—After lunch Blount and I decided to go out to Louvain to learn for ourselves just how much truth there is in the stories we have heard and see whether the American College is safe. We were going alone, but Pousette and Bulle, the Swedish and Mexican Chargés d'Affaires, were anxious to join us, so the four of us got away together and made good time as far as the first outpost this side of Louvain.

Here there was a small camp by a hospital, and the soldiers came out to examine our papers and warn us to go no further as there was fighting in the town. The road was black with frightened civilians carrying away small bundles from the ruins of their homes. Ahead was a great column of dull grey smoke which completely hid the city. We could hear the muffled sound of firing ahead. Down the little street which led to the town, we could see dozens of white flags which had been hung out of the windows in a childish hope of averting trouble.

We talked with the soldiers for some time in an effort to get some idea of what had really happened in the town. They seemed convinced that civilians had precipitated the whole business by firing upon the Staff of a General who was parleying with the Burgomaster in the square before the Hotel de Ville. They saw nothing themselves and believe what they are told. Different members of the detachment had different stories to tell, including one that civilians had a machine gun installed on top of the Cathedral and fired into the German troops, inflicting much damage. One of the men told us that his company had lost twenty-five men in the initial flurry. They were a depressed and nervous-looking crew, bitter against the civil population and cursing their ways with great earnestness. They were at some pains to impress upon us that all Belgians were *Schwein* and that the people of Louvain were the lowest known form of the animal.

After talking the situation over with the officer in command we decided to try getting around the town to the station by way of the ring of outer boulevards. We got through in good shape, being stopped a few times by soldiers and by little groups of frightened civilians who were cowering in the shelter of doorways listening to the noise of fighting in the town, the steady crackle of machine guns, and the occasional explosions.

They were pathetic in their confidence that the United States was coming to save them. In some way word has

travelled all over Belgium that we have entered the war on the side of Belgium and they all seem to believe it. Nearly every group we talked to asked hopefully when our troops were coming, and when we answered that we were not involved they asked wistfully if we didn't think we should be forced to come in later. A little boy of about eight in a group that stopped us asked me whether we were English, and when I told him what we were he began jumping up and down clapping his hands and shouting:

Les Américains sont arrivés! Les Américains sont arrivés!

His father told him to be quiet, but he was perfectly happy and clung to the side of the car as long as we stayed, his eyes shining with joy, convinced that things were going to be all right somehow.

About half way around the ring of boulevards we came to burning houses. The outer side of the boulevard was a hundred feet or so from the houses, so the motor was safe, but it was pretty hot, and the cinders were so thick that we had to put on our goggles. A lot of the houses were still burning, but most of them were nothing but blackened wall with smouldering timbers inside. Many of the front doors had been battered open in order to start the fires or to rout out the people who were in hiding.

Slaughtered Citizens

We came to a German ammunition wagon half upset against a tree where it had been hurled when the horses had turned to run away. The tongue was broken and wrenched out. Nearby were the two horses dead and swollen until their legs stood out straight. Then we began to see more ghastly sights—poor civilians lying where they had been shot down as they ran—men and women—one old patriarch lying on his back in the sun, his great white beard nearly hiding his swollen face. All sorts of wreckage scattered over the street, hats and wooden shoes, German helmets, swords and saddles, bottles and all sorts of bundles which had been dropped and abandoned when the trouble began. For three-quarters of a mile the boulevard looked as though it had been swept by a cyclone. The Porte de Tirlemont had evidently been the scene of particularly bloody business. The telegraph and trolley wires were down; dead men and horses all over the square, the houses still burning. The broad road we had travelled when we went to Tirlemont was covered with wreckage and dead bodies.

Some bedraggled German soldiers came out from under the gate and examined our passes. They were nervous and unhappy and shook their heads gloomily over the horrors through which they were passing. They said they had had hardly a minute's sleep for the past three nights. Their eyes were bloodshot and they were almost too tired to talk. Some of them were drunk—in the sodden stage when the effect begins to wear off. They told us we could proceed in safety as far as the station, where we would find the headquarters of the commanding officer. Here we could leave the motor and learn how far we could safely go. This crowd varied the wording a little by saying that the Belgians were all dogs and that these particular dogs were being driven out as they should be—that all that part of the town was being cleared of people—ordered to leave their homes and go to Brussels or some other town so that the destruction of Louvain could proceed systematically. We thought at the time that they were exaggerating what was being done, but were enlightened before we had gone much further.

We continued down the boulevard for a quarter of a mile or so till we came to the station. Sentries came out and looked through our passes again. We parked the motor with a number of German military cars in the square and set off on foot down the Rue de la Station, which we had admired so much when we had driven down its length just ten days before.

The houses on both sides were either partially destroyed or smouldering. Soldiers were systematically removing what was to be found in the way of valuables, food, and wine, and then setting fire to the furniture and hangings. It was all most businesslike. The houses are substantial stone buildings, and fire will not spread from one to another. Therefore the procedure was to batter down the door of each house, clean out what was to be saved, then pile furniture and hangings in the middle of the room, set them afire, and move on to the next house.

It was pretty hot, but we made our way down the street, showing our passes every hundred feet or so to soldiers installed in comfortable armchairs which they had dragged into

the gutter from looted houses, till we came to a little crossing about half-way to the Hotel de Ville. Here we were stopped by a small detachment of soldiers who told us that we could go no farther; that they were clearing civilians out of some houses a little farther down the street and that there was likely to be firing at any time.

The officer in command spoke to us civilly and told us to stick close to him so that we could know just what we ought to do at any time. He was in charge of the destruction of this part of the town and had things moving along smartly. His men were firing some houses near-by and he stood outside smoking a rank cigar and looking on gloomily.

We exchanged remarks with him in German for a few minutes, I limping along behind the more fluent Pousette and Bulle. Then I said something in an aside to Blount and the officer broke into the conversation in perfectly good English. He turned out to be a volunteer officer from Hamburg who had spent some thirty years in England and was completely at home in the language.

We then accomplished the formal introductions which are so necessary to Germans even at a time like this, and when we came to Bulle the officer burst into a rapid fire of questions which ended in his proclaiming in rapture:

"Why, I knew your father in Hamburg and went to school with your Uncle So-and-So!"

Reminiscence went on as though we were round a dining table at home; minute inquiry was made into the welfare and activities of the Bulle family from the cradle to the grave. On the strength of the respectability of Bulle's relatives we were then taken under the officer's wing and piloted by him through the rest of our visit.

Dynamite and Drunkenness

From where we stood we could see down the street through the smoke as far as the Hotel de Ville. It was still standing, but the Cathedral across the street was badly damaged and smoke was rising in clouds from its roof. The business houses beyond were not to be seen; the smoke was too dense to tell how many of them were gone.

Machine-guns were at work near by, and occasionally there was a loud explosion when the destructive work was helped with dynamite.

A number of the men about us were drunk and evidently had been in that state for some time. Our officer complained that they had had very little to eat for several days, but added glumly that there was plenty to drink.

A cart, heaped high with loot, driven by a fat Landsturner and pulled by a tiny donkey, came creaking past us. One of our party pulled his kodak from his pocket and inquired of our guardian in English: "May I take a picture?"

His real intention evidently escaped the German who answered cordially:

"Certainly; go ahead. You will find some beautiful things over there on the corner in the house they are getting ready to burn."

We kept our faces under control, and he was too much occupied with his other troubles to notice that we did not avail of his kind permission to join in the pillage.

He was rabid against the Belgians and had an endless series of stories of atrocities they had committed—though he admitted that he had none of them at first hand. He took it as gospel, however, that they had fired upon the German troops in Louvain and laid themselves open to reprisals. To his thinking there is nothing bad enough for them, and his chief satisfaction seemed to consist in repeating to us over and over that he was going the limit. Orders had been issued to raze the town—"till not one stone was left on another," as he said.

Just to see what would happen I inquired about the provision of the Hague Conventions prescribing that no collective penalty can be imposed for lawless acts of individuals. He dismissed that to his own satisfaction by remarking that:

"All Belgians are dogs, and all would do these things unless they are taught what will happen to them."

Convincing logic!

With a hard glint in his eye he told us the purpose of his work; he came back to it over and over, but the burden of what he had to say was something like this:

"We shall make this place a desert. We shall wipe it out so that it will be hard to find where Louvain used to stand. For generations people will come here to see what we have done, and it will teach them to respect Germany and to think twice before they resist her. Not one stone on another, I tell you—*nie ein Stein an e'nder!*"

I agreed with him when he remarked that people would come here for generations to see what Germany had done—but he did not seem to follow my line of thought.

While we were talking about these things and the business of burning and looting was pursuing its orderly course, a rifle

shot rang out near by. Instantly every soldier seized his rifle and stood waiting for an indication as to what would happen next. In a few seconds a group of soldiers rushed into a house about a hundred feet away. There was a sound of blows as though a door was being beaten in; then a few shots, and the soldiers came out wiping the perspiration from their faces.

"Snipers!" said our guide, shaking his fist at the house. "We have gone through that sort of thing for three days and it is enough to drive us mad, fighting is easy in comparison, for then you know what you are doing." Then, almost tearfully: "Here we are so helpless!"

While he was talking, another shot rang out, and then there was a regular fusillade, which lasted for fifteen seconds or so; then an explosion:

Bulle stood not upon the order of his going but ran for the station calling back: "I've had enough of this. Let's get out and go home."

Our friend the officer said Bulle was right, and that it would be the part of wisdom for us all to fall back to the station where we would be near the car in case anything happened. He started off at a good pace, and, as we were in no mood to argue, we went meekly along in his wake. We overtook Bulle engaged in an altercation with a very drunken soldier who wanted to see his papers and was insulting about it. Instead of taking the easy course and showing his papers, Bulle was opening a debate on the subject when we arrived and took a hand. Our officer waded into the soldier in a way that would have caused a mutiny in any other army, and the soldier, very drunk and sullen, retreated muttering, to his armchair on the curb. We then moved on to the station.

Outside the station was a crowd of several hundred people, mostly women and children, being herded on to trains by soldiers to be run out of the town. They seemed to be decently treated, but were naturally in a pitiable state of terror. Just inside the gates of the freight yard were a couple of women telling their troubles to a group of officers and soldiers. They had both lost their husbands in the street fighting, and were in a terrible state. The officers and men were gathered about them, evidently distressed by their trouble and trying to comfort them. They had put the older woman in an arm-chair and were giving her a little brandy in a tea cup. And the same men may have been the ones who killed the husbands.

We went on into the freight yards and were greeted by a number of officers with hopeful talk of a train coming from Brussels with food. We were given chairs and an orderly was despatched for a bottle of wine, so that a drink could be given to Bulle, who said that after what he had been through he would appreciate a glass of something comforting.

Teaching Respect for Germany

We settled down and listened to the stories of the past few days. It was a story of clearing out civilians from a large part of the town; a systematic routing out of men from cellars and garrets, wholesale shootings, the generous use of machine guns, and the free application of the torch—the whole story enough to make one see red. And for our guidance it was impressed on us that this would make people respect Germany, and think twice about resisting her.

Suddenly several shots rang out, apparently from some ruins across the street, and the whole place was instantly in an uproar. The lines of civilians were driven helter-skelter to cover—where, I don't know. The stands of arms in the freight yard were snatched up, and in less time than it takes to tell it, several hundred men were scattered behind any sort of shelter that offered, ready for the fray.

I took one quick look about and decided that the substantial freight station was the most attractive thing in sight. In no time I was inside, closely followed by my own crowd and a handful of soldiers. First we lay down upon the platform, and then, when we got our bearings, rolled over on to the track, among a lot of artillery horses that were tethered there.

Apparently a number of civilians, goaded to desperation by what they had seen, had banded together, knowing that they were as good as dead, and had determined to sell their lives as dearly as they could. They had gathered in the ruins of the houses fronting on the station and had opened up on us. There was a brisk interchange of shots, with an occasional tinkle of broken glass and a good deal of cursing by the soldiers who had taken refuge with us.

The artillery horses did not welcome us very cordially, and began to get restive in a way that made us debate whether we preferred staying up on the platform with a chance of being potted, or staying under cover and being ingloriously trampled to death. A joint debate on this important question kept us occupied for several minutes. We finally compromised

by fishing down a few boxes from the platform and erecting a barricade of sorts to protect us against stray kicks.

As we sat in the undignified position imposed on us by circumstances we exchanged frivolous remarks, not because we felt particularly gay, but because we had to do something to keep ourselves interested and to keep our courage up. Bulle resented this and raised his head to look at me reproachfully over the barricade and say: "Don't talk like that; it is nothing short of tempting Providence."

After a time, Blount and I decided to make a reconnaissance in force, and see how the car was getting on. We crawled along the floor to a place from which we could see out into the square. The soldiers were flat on their stomachs behind a low wall that extended around the small circular park in the centre of the square, and behind any odd shelter they could find. The car lay in the line of fire but had not been struck. We were sufficiently pessimistic to be convinced that it would go up in smoke before the row was over, and took a good look at our shoes to see whether they would last through a walk back to Brussels.

Our officer came out from behind his barricade and showed us where the attacking force was concealed—at least, he told us that they were there, and we were willing to take his word for it without going across the street to make a first hand investigation.

The German Version

He tried to impress us with the black sinfulness of people who would fire upon the German troops, and called our particular attention to the proof now offered us that civilians had started the row by firing on German troops. According to the German story, which was the only one we had heard, civilians had been hunted down like rats in garrets and cellars, and shot down in cold blood in the streets when they sought safety in flight. To my mind, it was not surprising that men driven to desperation by seeing their friends and neighbours murdered in cold blood should decide to sell their lives as dearly as they could and should do any possible harm to the enemy. Three days of the reign of terror that had been described to us was enough to account for anything, and the fact that civilians were firing now did not, in any sense, prove that they were guilty of starting the trouble. For all we could tell, they may have started it or they may not have—but firing by them three days after the row began was no proof to anyone with the slightest sense of the value of evidence. On the other hand, the story freely told us by the Germans as to their own behaviour is enough to create the darkest presumptions as to how the trouble started—and would seem to place the burden of proof on them rather than on the Belgians.

While we were talking about this there came another rattle of fire, and we scuttled back to our shelter among the horses. Every now and then a surly soldier with two huge revolvers came and looked over the ledge at us and growled out: *Wass machen Sie denn hier?* followed by some doubting remarks as to our right to be on the premises. As he was evidently very drunk and had tempered, I was not at all sure that he would not decide on his own responsibility to take no chances, and put us out of our misery. After several visits, however, he evidently found something else more interesting, and came back no more to trouble us.

When the row began, a motor had been despatched toward Brussels to recall some troops that had left a few hours before; now and then our officer came in to tell us what he thought of their chances of getting back.

On one of these visits Blount remarked by way of airy persiflage that that drink of wine that had been sent for was a long time coming. Anything as subtle as that was lost on our friend, for he walked solemnly away, only to reappear in a few minutes with a bottle and several glasses which he set up on the edge of the platform and filled with excellent Burgundy. We stood up among the horses and drained a bumper of the stuff while the officer wandered back to his work. He had gone calmly out into the thick of things to rescue this bottle and took it as a matter of course that we should claim the drink that had been promised us.

Presently with a good deal of noise a fairly large force of troops came marching down the boulevard and took up positions around the station. Our officer returned, waving a smoking revolver, and told us to lie down as flat as we could among the horses and not to move unless they got restive. He said it looked as though an attempt would be made to take the station by storm and that there might be a brisk fight.

However, there were only a few scattering shots, and then our friend came back and told us that we had better get out and start for home before things began again. He added, however, that we must have the permission of the commanding officer who was on the other side of the station, but offered to pilot us to the great man and help us get the per-

mission. The way lay straight out into the square, in full view of the houses across the road, along the front of the station just behind the troops and into the railroad yard on the other side.

That station seemed about four miles long, and the officer was possessed of a desire to loiter by the way recounting anecdotes of his school days. He would walk along for a few steps and then pause to tell Bulle some long and rambling yarn about his uncle. Then the old chap would transfer his conversational fire to another member of the party, and we were obliged almost to pull him the length of the square.

The commanding officer was a pleasant-faced little man who stood in the shelter of a water tank and received us in a puzzled way as though he wondered what civilians were going in that neighbourhood anyway. Permission was readily granted for us to leave—with the ludicrous proviso that we did so "at our own risk." Then Bulle put everybody in good humour by inquiring innocently if there was any danger. Everybody burst into peals of laughter, and we were escorted to our car by the same slow moving officer, who insisted on exchanging cards with us and expressing the hope that we should meet again—which we could not honestly reciprocate. Then, after an hour and a half in the station, we got away amid a great waving of hands.

The boulevards were deserted save for the troops coming back into the town. New houses were burning that had been intact in the afternoon. After passing the Porte de Tirlemont we began to see people again—little groups that had come out into the streets through a craving for company and stood huddled together listening to the fighting in the lower part of the town. In harmony with the policy of terrorising the population the Germans have trained them to throw up their hands as soon as any one comes in sight in order to prove that they are unarmed and defenceless. And the way they do it, the abject fear that is evident, shows that failure to comply with the rule is not lightly punished.

Our worst experience of this was when in coming around a corner we came upon a little girl of about seven carrying a canary in a cage. As soon as she saw us she threw up her hands and cried out something we did not understand. Thinking that she wanted to stop us with a warning of some sort we put on the brakes and drew up beside her. Then she burst out crying with fear and we saw that she was in terror of her life. We called out to reassure her, but she turned and ran like a hunted animal.

It was hard to see the fear of others—townspeople, peasants, priests, and feeble old nuns who dropped their bundles and threw up their hands, their eyes starting with fear. The whole thing was a nightmare.

And so back to the Legation without further mishap to find everybody worrying about us.

Systematic Atrocities

The foregoing is an impression of one afternoon at Louvain taken from a journal written at the time. It was intended to pass on the question of responsibility for precipitating the orgy of murder and bestiality indulged in by the German Army from August 25th until the 30th, when orders were received from Berlin to stop the destruction and restore public order.

Many subsequent visits to Louvain and conversations with people who were there when the trouble began have only served to strengthen the impression that the whole affair was part of a cold blooded and calculated plan to terrorize the civilian population.

While we were there it was frankly stated that the town was being wiped out; and its destruction was being carried out under definite orders. When the German Government realized the horror and loathing in which the civilized world learned of the fate of Louvain the orders were cancelled and the story sent out that the German forces had tried to prevent the destruction, had fought the fire, and by good fortune had been able to save the Hotel de Ville. Never has a Government lied more brazenly. When we arrived the destruction of the town was being carried on in an orderly and systematic way that showed careful preparation. The only thing that saved the Hotel de Ville was the fact that the German troops had not progressed that far when the orders were countermanded from Berlin.

It was only when he learned how civilization regarded his crimes that the Emperor's heart began to bleed.

The true facts as to the destruction of Louvain will startle the world—hardened though it has become to surprise at German crimes. Unfortunately, however, it is impossible to publish the details at this time without endangering the lives of people still in Belgium under German domination. But these people will speak for themselves when the Germans have been driven from Belgian soil and they are once more free to speak the truth.

Life and Letters

Sir Charles Dilke

By J. C. Squire

IN almost every chapter of Sir Charles Dilke's *Life* (by Stephen Gwynn and Gertrude M. Tuckwell, Murray, 2 vols. 36s. net), there is enough material for a *Quarterly* article. His experience of and judgments upon, foreign politics would in themselves make a valuable book. He was in politics for fifty years; was at one time a candidate for the Premiership; he knew and corresponded with what one may call the front benches of five continents, and touched every sphere of social life. His versatility was amazing. At Cambridge he was top of the Law Tripos, President of the Union, and, but for his doctor, would have rowed twice against Oxford. He read, it seems, a large part of the contents of the British Museum; he was asked to do Keats for the "English Men of Letters" series; he travelled, rowed, fenced and dined out almost all his life; and he found time to acquire on every subject of current politics an amount of information which was a store-house for every individual and organisation that ever worked with him. But if it is quite impossible to review his biography because there is too much in it; from another point of view it is difficult to review it because there is too little. It is largely composed of his own memoirs: but one learns scarcely anything about the essential man from it.

* * * * *

There is an interesting communication here from General Seely, who says that for a long time he could not make out what on earth Dilke was up to; and how at last he found that his only motive was an unselfish desire to help his more unfortunate fellow-men. It cannot but have been that; but the slowness with which General Seely appreciated it is the measure of Dilke's extraordinary reticence. How far his intimates got past this—how far, that is, he ever had an intimate—one cannot tell; but, dead as alive, the outside observer cannot really feel he knows him. All his life he was to some extent a sphinx, though an active and loquacious sphinx. In later years there was an added mystery; for he possessed, in the public eye, a special secret, whether it was the secret of his guilt or the secret of his innocence. But, apart from that, he did not disclose himself; and it is possible that he did not even know himself. You can only get at his soul by inference. And this much is certain—and the justice or injustice of his condemnation after the scandal is not relevant here—that no man ever put up a finer show after a knock-down blow. He did not sulk, or take to drink, or even, as he might pardonably have done, retire to the country and read; he faced the music and began a second political career, determining by sheer doggedness to induce his country to profit by a desire and ability to serve her which have seldom been united, in such a degree, in a single man. He succeeded so completely that, at the end of his life, the later Dilke had completely obscured the earlier Dilke in men's minds. That is not failure in the private man. And it is arguable that Dilke was not even a comparative failure as a politician. In these later years—his last two Parliaments saw him sitting, straight-backed, beautifully dressed, fortified with many blue-books, with the new Labour Party—he was directly and indirectly responsible for most important reforms, notably the Trade Boards Act. His advice behind the scenes was so freely sought and given that he may properly be regarded as an unofficial leader of the Labour movement. He did far more than he got recognition for; but he had lost the desire for leadership; and, having rehabilitated himself in the eyes of his countrymen, he was not anxious for recognition of any other kind. Influence—to be exercised in the public interest—was what he wanted and got. And it is at least arguable that he would have done little more had nothing gone wrong than he did as things were. For, in spite of his intellectual attainments, integrity and force of character, he had drawbacks which critics, for the moment, seem to have forgotten.

* * * * *

It seems, in short, now to be commonly assumed that had it not been for the Crawford catastrophe, Dilke would have become leader of his party and Prime Minister. Gladstone expected him to be, and Chamberlain had agreed that he should be so on account of his superior authority in the House. Speculation on the point is of the "If Napoleon had won Waterloo" type: you may advance many reasons for whatever view you hold, but you cannot approach proof. But personally, not only do I think that Chamberlain—leaving other candidates out of the question—would have inevitably overtaken Dilke had the partnership lasted

and prospered, but I cannot easily persuade myself that anything could have made a Prime Minister out of Dilke. He was a statesman: and he was exceedingly skilful as a mere politician who knew the best way in which to get things done. His knowledge was immense of many kinds. He was fitted for any ministerial post, and had he become, in later years, Foreign Secretary, Colonial Secretary, Secretary for India, Home Secretary, President of the L.G.B., President of the Board of Education, or President of the Board of Trade, he would have known more about any of these jobs than any other politician of his time. Everybody who knew him respected him: most people who met him liked him; his constituents, both in Chelsea and in the Forest of Dean, were enormously proud of him. A man to be Prime Minister may have far less knowledge, sense and disinterested patriotism than Dilke; but unless accident has given him the, as it were, automatic support of some strong "interest," local, commercial, social or religious, he must have the power of exciting or amusing, at any rate interesting, the electorate. Dilke's personality was not of the sort which captivates large masses of electors. Writing himself of a speech he made in his twenties, he says:

It was a dreary speech; and, given the fact that my speaking was always monotonous, and that at this time I was trying specially to make speeches which no one could call empty noise, and was therefore specially and peculiarly heavy, there was something amusing to lovers of contrast in that between the stormy heartiness of my reception at most of these meetings, and the ineffably dry orations which I delivered to them—between cheers of joy when I rose and cheers of relief when I sat down.

This was a peculiar occasion, for the discussion over the Civil List had given Sir Charles a fleeting reputation as a Republican fire-eater and the audiences assembled in a state of excitement. As a rule, you got the "ineffably dry" speech without the cheers. In his last ten years his habits of discursiveness and droning had got so acute that he was impossible to follow. Whatever the subject—and it might be anything from Army organisation to the sweated chain-makers of Cradley Heath—he would stand up and pour out thousands of facts in a monotonous gruff boom, his words periodically becoming inaudible as he buried his head in his notes or turned round to pick up a profusely annotated Blue-Book from his seat. The Minister involved would stay; a few experts on the particular subject involved would compel themselves to attend, knowing that his matter was bound to be valuable if they could only get the hang of it.

* * * * *

His character was universally respected; he was admired as a repository of information and wisdom, and a young member, of whatever party, who was congratulated by him upon a speech got a more genuine pleasure out of his praises than from any perfunctory compliments from the front benches. Nevertheless, nothing could stop his audiences from dwindling away or his voice from hilling the survivors to sleep. He knew that his voice was monotonous: that he could not help. But he had also an intellectual disability which made him treat every small fact as if it were of equal value to almost any other fact, and a pronounced temperamental disinclination to be "rhetorical." He was too reticent to show his personality: and he would not manufacture a sham personality for public exhibition. He hated importing feeling into his speeches, however strong might be the passion for justice or mercy behind them; he deliberately refused to make an easy appeal by frequent reference to "first principles" or cultivate those arts of expression whereby politics may be made enjoyable to bodies of men, or even those arts of arrangement whereby they may be made simple and comprehensible. He felt all these things to be humbug, and humbug was abhorrent to him: failing to observe that, since under our system speeches are an important part of a controversialist's career and of a minister's administration, it is the business of a man who would lead his countryman to pay some attention—unless he is a demagogue born—to the technique of "rhetoric." In private conversation Dilke is reported to have been one of the most interesting men of his age. But on the platform and in the House of Commons he was distinctly and undeniably dull. And it is possible that England would not have stood a Radical Prime Minister who sent her to sleep.

Port Said and a Tale of the Sea

By William McFee

Port Said, July, 1917.

Of course! Just as my letter to you, complaining by the way of your silence, reached the bottom of the letter box in the Custom House Shed, your letter to me is delivered! However, I am so glad the mails come and go. Erratically, but they come and go. You know, of course, that we are not supposed to take our letters ashore? We are not.

Going ashore here, by the way, is quite a purgatory. First, you must have a boat, and endure the basilisk glare of a boatman whose legal fare is fourpence but whose first demand is for four shillings. He comes down to sixpence, by the way. You are then assaulted by various licensed brigands called guides, who foist themselves upon you on the quay and who, unless forcibly restrained, will conduct you all over the town at a break-neck speed, ordering all manner of Oriental goods which you don't want, and ending up by showing you a license from the Egyptian Government empowering them to charge you forty piastres an hour. Having whirled your umbrella round and round to rid yourself of these ambulatory pests, you are directed by an incredibly tall policeman in black boots, white uniform and scarlet fez, to enter the passport office.

The passport you must have already secured from the purser signed by the commander of your vessel. This is inspected, and held to the light and smelt by a gentleman of the country, who asks you various questions as to your identity. Finally he stamps it and permits you to pass. That is the first stage. You emerge into a long yard, with the Customs baggage-shed on your left and verandahed offices screened by a superb scarlet-flowered mimosa-tree on the right. Another policeman bars the way except into the shed where, if you have baggage, you must open it and declare all dutiable goods. You have only your umbrella and a wrist-bag, so you advance to a table at the far end where a British soldier in khaki sits in judgment upon you. You must show your pass again. You must give up your letters to be posted.

You are asked by an Egyptian assistant, if you have any weapons or firearms concealed about your person. If you reply, as I did once, "Yes, I have a twelve-inch gun in my pocket," you will be regarded severely by the soldier, whose brain has become nearly unhinged with poring over *Arabic without a Master in fifteen lessons*. However you pass the examination with credit and are permitted to emerge from the shed into the street. You are free! You can go wherever you please. Alas, after all this fuss, there's nowhere to go!

Moreover since it is July, you will find the sun very warm. You seek the shady side of Main Street. Here are the stores where you can buy, at enormously enhanced prices, anything from American tooth-paste and chewing-gum to Japanese silks and tea-sets. They are called Oriental stores, but the only Oriental thing about them is the salesman's habit of sitting at the door-way. But if you do not wish to spend money, Port Said, as I have said before, has no use for you. There are no sights save the beach. So you wander on, turning a corner and threading your way amongst the tables of the cafés until you reach the Eastern Exchange Hotel, popularly known as the Eastern, a vast structure of steel and glass arcing over the street.

The Eastern is the great clearing house of the gossip of East and West. Here congregate the merchant officers from London and the Orient. Here the waiters in white Egyptian costume with scarlet fez and sash serve drinks to men who have come from the ends of the ocean-highways. Here the skipper from Singapore meets an old shipmate from New Orleans or Buenos Aires and exchanges grievances and home news. An interesting place this arcade of the Eastern, with its white figures forever gliding to and fro with trays of drinks, its huge bower of palms and shrubs and creepers in enormous tubs, and its plaintive orchestra somewhere round the corner. Most interesting of all I think at night, when all the lights of the town are darkened down and one sits as in a dusky aisle of some artificial forest and looks out into the impenetrable gloom of the street. Extraordinary how the same groups congregate at the little tables night after night, month after month. A year and a half ago I can recall the same faces. The mortality is not very high among officers at a base.

It was here, too—and this is what I wanted to tell you—that I heard a tale, a badly-told laconic tale of the sea. I had met a shipmate, just in from Marseilles, and we sat talking for a long time. In fact I ought to have been in bed, for I was going on watch at two. Suddenly he sucked at his cigar and took it from his lips, leaning forward over the table:

"Did you hear about the *Abacadabra*?"

I nodded. "Submarine got between her and the setting sun and nearly knocked her to pieces with shell-fire before they could make out where the shots were coming from. Skipper got the D.S.O."

He shook his head. "Not that. I mean later."

I shook my head in turn. "What happened later?"

Well, he told me as I said, in an imperfect laconic fashion, for he is not an artist in words. One or two phrases he struck out, however, which I shall use as occasion serves. I like them. You see, he was there.

* * * * *

The *Abacadabra* escaped on that first occasion with the loss of a dozen killed and as many wounded. It was a grim commentary on that little affair that they used a bucket-tull, which is two and a half gallons, of friar's balsam, in two hours. But they gained on the submarine, and her commander received the D.S.O. While she was refitting my friend joined her as Second, and away they went to sea again. Ordinary trade to South America, for she was not a transport. Nor did the incident come under the head of war-news at all save that the ships were without lights. It was winter time, in the Atlantic, but not so far from land, and a fine but dark and moonless night. Just before daylight the *Abacadabra*, outward bound in ballast, was struck forward of the funnel by another vessel, loaded, on another course. Who was to blame, or how, I don't pretend to know. The point is that the *Abacadabra* was badly stove in at the bridge and began to make water. My friend, who was on watch, was joined by the Chief and Third down below. The telegraph, which had been whirled to full astern at the moment of impact and back to stop, was now pointing irresolutely to Stand By. Good enough, as they say in the West country; they were standing-by.

And now comes the astounding part of the tale. As my friend told me this part of it, the high lights of the arcade peering out of their green-painted petroleum-tin hoods showed me his face drawn into an expression of extraordinary anxiety. The waiters were piling chairs and only a few groups remained dotted about the grim corridor. A carriage with one twinkling lamp drove softly by, a cigar glowing just behind the driver. My friend leaned forward and thrust his harsh Celtic features towards mine. His eyes stared. I suppose I stared back at him, for what he said made one anxious. Anxious, not about oneself, but about one's beliefs, one's tacit acceptances, one's faith in the integrity, the ultimate integrity, of humanity.

For those three men stood by for the better part of an hour. The stokehold was empty, the steam was dropping, and there was considerable water in the bilges, but they stood-by watching the speaking-tube and the blind white face of the telegraph pointing irresolutely to Stand-By. And presently the strain of waiting grew oppressive, so that the chief, looking up towards the skylight said to my friend, "Mister, go up and see what's doing. It must be daylight now." And up he went, and came out on deck and found himself face to face with a problem of some complexity. For the deck of the ship was deserted, and far across the dark sparkle of the sea he saw the boats crawling towards a smear of smoke on the sky-line.

For a moment he was so dazed that he stood staring like a man half-stunned by a blow on the head. And then a species of sickness attacked him, a sickness which in my opinion was only partially physical, for as he put it, for a minute "he had no heart." And mind you, it wasn't danger that made him give way for a second to despair. It was something behind all that. It was as though a brutal foot had kicked away all the under-pinning of his faith in man and sent it crashing about his ears. It was incredible. Yet the tackle swinging idly from the davits, the empty chocks, the silence, were incontrovertible. For a moment, I say, he was as though he had been sand-bagged. And then, with a hoarse imprecation he flew to the top of the engine-room ladder, where the other two, listening apprehensively to certain mysterious noises in an otherwise silent ship, saw him waving his arms like a madman and crying out in a strained inarticulate wail, to come up, to come up quick . . . quick . . . never mind anything . . . come on.

Of course they came, four or five steps at a time. They found my friend on deck, the palms of his hands and his breast pressed against the bulwarks looking at those distant boats as though he wanted to remember the picture through all eternity. He certainly won't forget it while he is alive. As for the others, they were so faint with the revelation that they had to sit down and close their eyes. Good God! You know, I gather that for a moment their feeling was this.

Why, if that is all we count for, what is the good of going back? And just then the *Abracadabra* gave a very gentle lurch forward.

This was a fortunate thing for them, for it aroused them to the fact that they had other problems beside the grand tragedy which had been engaging their souls. The ship was sinking. For a moment they were in "a state," as my friend put it. I think that is a very mild description of most of us under similar circumstances. The sudden reaction from agonised thought took the form of running round the decks opening the life-belt lockers, lifting pieces of wood, looking hastily at each other and dashing off again. And then they found the raft.

Let me explain. If you serve or travel on a French, Italian, Greek or Portuguese vessel, you will find an abundance of unsinkable flat rafts provided, fastened ready to float off from rails and shrouds as the ship founders. But on a British ship this would not do at all. The prevailing idea in a British ship seems to be that a few bottles of lime-juice and a minimum number of life-belts is all that is necessary in war-time to go all over the world. There seems to be a feeling that it is bad form to worry about life-saving apparatus. I don't offer any solution of the perplexity. There it is. There it was. The chief mate of the *Abracadabra* had managed to fashion some sort of clumsy top-heavy affair out of four oil-barrels and some old hatches lashed with rope. It had become an institution, a joke, a menace, a nuisance on deck. By some obscure miracle, during the battle with the submarine the previous voyage, this frowzy old makeshift escaped without a scratch. And now the three castaways remembered it and hurried to the fore deck where it lay. As soon as they saw it they realised that it would take a dozen men to move it. And at that moment the *Abracadabra* gave another gentle lunge forward. In perfect silence they got upon the raft and prepared to hold on.

Of course it is simple enough in theory. The ship sinks and leaves you clinging to the raft and you are saved. In practice however there are complications. A ship does not sink on an even keel. You cannot float off a modern steamer's fore-deck as from a billiard table. That fore-deck is encumbered with all sorts of things, winches, bollards, anchors, snatch-blocks, booms, gins, slings, tackle, hawsers, ring-bolts, ventilators, steam-pipes, ladders and so on. And consequently our three adventurers, as they sat on that frowzy

old raft and looked the winter sun in the eye as he came shouldering up out of his bed of billowy morning vapour, regarded the immediate future with some misgiving.

The Chief, a big heavy elderly man, gnawed his moustache and looked as if he were trying to remember where he had put something. My friend told me he felt "all of a sudden fed-up with it all." I imagine he would be, but he had no time for meditation, for the *Abracadabra* began to do strange things. She rolled. She righted. Then she dipped her fore-deck ever so little. Her centre of gravity was changing at lightning speed all the time, like that of an intoxicated man. She was half-full. Suddenly a hatch burst open and flew into the air with a report like a six-inch gun. The Third let go of the raft, he was so startled. And as he grasped it again the deck swam from under them and the raft surged to starboard, bringing up with a thump against the bollards. Then the water, cascading over the descending bulwarks, sent them with a rush against the winches. It was here that the Third got his leg against a wheel-guard and had a parallel strip of skin taken clean from hip to ankle-bone.

Once, in the rapids that came pouring over them as the *Abracadabra* reeled in the agony of death, they had an anxious moment - one of the ropes of the raft caught on a ventilator cover. Yet they could do nothing, for the raft was so tender it turned over and over if they moved. Blinded and buffeted they hung on until they felt an upward rush of water as the ship sank over her bridge deck, an upward rush that flung them here, and spun them there, and finally left them gasping in the easy swell of a fine morning in Mid-Atlantic. By some means they had hung on, and a trawler an hour later came upon them and fished them off that frowzy, idiotic, invaluable raft!

* * * * *

None of these three gentlemen will ever get within a mile of the D.S.O., but do you know I really believe the consciousness of having stood-by will in the course of years gradually obliterate from their minds the appalling shadow which hung over them when they came up that morning and saw the boats had gone.

That will be better than any decoration; for, as my friend put it: "If it hadn't been for *that*, it was a joke, man!"

Old Maid

By Alec Waugh

"ARE any of the following gentlemen in the mess, please, Mr. Ashworth, Mr. Kennedy, Mr. Ferguson. . . ?"

"Yes, I'm here."

"Sir, you are to hold yourself in readiness to proceed up the line, and to report to the adjutant at twelve and eight till further orders."

Mr. Ferguson, a very recently gazetted subaltern in the Machine Gun Corps, initiated the chat, and relapsed again into one of the many long wicker armchairs of the Base depot ante-room. He had been expecting to go up the line for several days; most of the fellows who had come over on draft with him had gone. He was not sorry. It was certainly pleasantly slack at the base, but it got boring after a bit. Yes, on the whole, he was jolly glad that he was moving. His preliminary training had taken a long time.

At twelve o'clock he duly reported himself at the Orderly Room.

"Oh, yes, you are Mr. Ferguson, aren't you?" said the assistant adjutant. "You've been posted to the 305th M.G. Company. Have your kit ready by six to-morrow, and a lorry will take you down to the station."

"What shall I do then?"

"Oh, that's all right. They'll see about that there," said the adjutant, with vague and complacent optimism.

For Military Administration is only a glorified game of "Old Maid," and the subject under discussion is the unlucky card, which each player in turn passes on to the next, heaving a sigh of thanksgiving as soon as he is relieved of all further responsibility. In this case Second-Lieutenant Ferguson was old maid; somehow he had to be got to the Headquarters of the 305th M.G. Company; but each branch was only concerned with the job of getting him off its hands as quickly, and with as little trouble to itself as possible.

Next day the game began in earnest.

From six in the morning to seven at night he was hurried from one spot to another. He seemed to be in a continual state of reporting to Majors with blue hat-bands.

"Ah, yes," they would say. "The 305th M.G. Company. That's the 131st Division. Well, you'd better go to Ambreville, and they'll put you right."

And so for thirteen hours he travelled in the slowest of slow trains without the least idea of his eventual destination.

From time to time Mr. Ferguson, observing the rules of the game he was playing, changed trains, but the essential characteristics remained unaltered. Wearily he and the train and the day dragged through thirteen stuffy hours. But at last he reached the railhead. It was now seven o'clock; and Mr. Ferguson had begun to hope that he was at last somewhere near the end of his journey. It was almost with elation that he reported himself to the R.T.O.

"The 305th M.G. Company, sir?" he queried with military severity.

And now the R.T.O. broke the rules of the game. Perhaps the result seemed to him a foregone conclusion. Perhaps he had played the game before so often that it had ceased to interest him. But, whatever his motives, his action was clear. Instead of passing on the card to his next door neighbour, he dropped it beneath the table, and made an end of the business.

With an air of genial benevolence, he despatched Mr. Ferguson to the Headquarters of his company, without worrying how he got there.

"Yes, Mr. Ferguson, you are at Rideau. It's about nine kilometres off."

"But how am I to get there?"

"Well, on ordinary nights you'd have to walk; but to-night the light-duty railway is running a carriage down there, and you can go back in that as far as Langeais, and then walk from there. It's quite simple. Any one will tell you the way. You're jolly lucky to have the railway."

And with a kindly smile the R.T.O. turned his attention to the next claimant.

Rather dubious about his good fortune, Mr. Ferguson returned to the railhead, and sought out a military policeman, who informed him that the train was due any minute.

"There's no time for me to get anything to eat, then?" asked the famished subaltern, who had existed the whole day on nothing more substantial than the small packet of sandwiches issued to him at the Base depot.

"Oh, no sir, there be no time for that. Train's due any minute, and it's the only train to-night. You can't afford

to miss it, sir. Let's see, sir, where be you going, sir? Rideau? Well, then, you'll have to change at Lillecourt."

"But the R.T.O. told me to change at Langeais."

"Oh no, sir, no, Lillecourt. It's much nearer. 'Ere Bill," he shouted to a perspiring orderly, "what be the nearest place for Rideau?"

"Oh ah, should think as 'ow Millemont were," replied Bill, without looking up from the floor-board he was scrubbing. "Or else Fleurville. One of the two, any'ow!"

Mr. Ferguson looked at the Sergeant hopelessly:

"Well, where am I to get out?"

"Can't say as 'ow it matters much, sir. They all be close enough away. I'm for Lillecourt myself. But each man to 'is own opinion."

And with this final expression of a philosophy of general toleration, the Sergeant left the gallant officer to sit on his valise, growing hungrier and hungrier every minute, as he watched the raindrops splash in the muddy puddles.

The train did not arrive till ten minutes past nine.

Manfully he shouldered his valise on to an open truck, and climbed in after it; cheered by the Sergeant who, having deceived and deserted him for upwards of two hours, arrived at the last moment in eager expectation of largesse, with the useful information that on the whole he had best get out at Maintenant-Les-Loges.

It is bad enough being old maid, even when she avoided card has got to find some eventual resting place, but when no one is responsible for its safe keeping, it is a game hardly worth playing.

* * * * *

After shivering for the space of some forty minutes in an open truck, Mr. Ferguson and his valise were deposited at Langeais. The valise he left in charge of a corporal in the R.E.'s, who assured him it would be quite safe in his hut (it took him two days to find it later on); and went in search of Rideau. There seemed little enough difficulty about that. Everyone appeared to know all about it. "Oh yes, it was just down the main road; less than two kilometres; twenty minutes' walk at the outside."

With hope burning high within him Mr. Ferguson set out. Soon he caught a glimpse through the gathered dusk of houses, and roofs and gables. There rose before him visions of food, a bed, and rest.

But the real fun had only just begun. Rideau was one of the villages that the Germans had been driven from some months back, and there remained of it nothing but broken walls, and leaning arches. In the dark, it presented an appearance of complete and utter desolation. There were no signs of life. Mr. Ferguson had thought that, as soon as he reached Rideau, his odyssey would be completed. He now learnt that it had only just begun.

Of the 305th M.G. Company there were no signs. It was now eleven o'clock, and Mr. Ferguson was both tired and hungry. After twenty minutes' fruitless wandering amid the wreckage of Rideau, he at last saw a light glimmering beneath a particularly dilapidated outhouse. With hope reborn, he beat on the door and pushed it open.

It was the quarters of the regimental S.-M. of the—shire Regiment.

"I say, do you know where the 305th M.G. Company are?"

"No, sir."

"Well, look here: can I see any of your officers? They might know."

The S.-M. drew himself to his full height. He was an old regular and a guardsman. He was not used to being woken up in the middle of the night by every new army officer who chose to walk in. It was out of order.

"I'm sorry sir, it can't be done."

"But look here: I mean—can't I see the adjutant or someone?"

"It can't be done, sir, it can't be done," replied the S.M. firmly, and Mr. Ferguson, realising that he could gather nothing from this relic of reaction, turned dismally to the deserted street.

A little way further down he saw another light. Here he found a large crowd of gunners playing cards. "No, they didn't know nothing about no Machine Guns, but Bill at the cookhouse 'e might know summat; 'is brother was a machine gunner."

Not very hopefully now, Mr. Ferguson sought the cookhouse. "No," said Bill, "I don't know where they could be. My brother 'e's in the 323rd; but they're in England still. I dunno I'm sure, but the corporal of the gas guard might tell 'e; 'e do know more than I do about these things."

But the corporal of the gas guard was equally vague. He thought there were some machine guns somewhere in Rideau; but where they were he didn't know. Mr. Ferguson thanked him with frigid gratitude, and passed out to wander backwards and forwards, seeking a chimera. Once he met a mounted captain, who assured him that he would find

Brigade Headquarters second on the right, and third to the left, and that they would be able to tell him there for certain. But it was not very helpful information, for in the dark it was impossible to tell the difference between a track, a disused tradesman's entrance, and a gap between two battered houses. So, after following innumerable blind alleys and tripping over countless wires, he was unable to discover the point from which he had started, so that "second on the right and third on the left" became as useful a guide as longitudinal bearings would be to a mariner without a compass.

But a limit is set to the longest pilgrimage. At last even the most weather-beaten Ulysses sees the white crags of his long-loved Ithaca. And so to the weary officer there came shortly after one o'clock the well-known pop-pop-pop of the Vickers gun. Eagerly he hurried in the direction of the sound. A few minutes' walk brought him to the emplacement, and the sentry indicated the Company Headquarters dugout that loomed a few yards up the road.

At last he would be able to get some food and a bed and sleep. He marched smartly into the dug-out. Recollecting quickly all he had been taught at his cadet battalion about reporting himself at his unit, he clicked his spurs and heels together, gave the regulation salute, and rapped out:

"Second-Lieutenant Ferguson, sir, reporting for duty."

The Captain looked at him, half in surprise, half in amusement.

"What company are you reporting to?" he said at last.

"The 305th Machine Gun Company, sir."

The Captain laughed.

"Say, old son, this is the wrong place. Your crowd have gone up north. We relieved them here last night!"

R.N.V.R.

BY N. M. F. CORBETT.

WHEN it is ended how shall I return
And gather up the ravelled threads again
Of my past life—content once more to earn
My daily bread in drudgery and pain?

I—that have been one of the fellow-ship
Of those who dare the dangers of the sea
And known the lift and swing of a big ship
Surging, full-powered, to action under me.

I—that have heard shells scream and seen men die
Laughing, as if the war were but a game;
And known the lust of battle; seen the sky
Filled, end to end, with whirling sheets of flame.
And felt my veins, long coursed by sluggish blood
Now thrilled and filled with wine and molten fire;
These have I known and I have found them good.
Can I to any lesser heights aspire?

I—that have seen Aurora's pallid spears
Defiantly shaken in the face of Heav'n
And felt that thrill of beauty, close to tears,
That flowers deep in the heart when, low at even,
Out of the Western sky of palest green
When all the sea is hushed and tremulous,
That first bright star gleams forth pure, pale, serene,
Touching the waves with silver—Hesperus.

I—that have seen God's fingers paint the dawn
In bars of rose and flame upon the East
And watched the night-mists as a veil withdrawn,
Fretted with gold and pearl and amethyst.
I—that have seen the hill-high, smoking surge,
Burst at our bows in rainbow-tinted spray,
And heard the taut shrouds moaning like a dirge,
Can I go back to smoky towns and grey?

With dirty streets and sordid offices,
And stupid talk in trains with stupid men.
Oh, every rustle of the dusty trees
Will bring remembrance and regret and pain.
I'll think I hear the whisper as the bow
Shears deep into the phosphorescent sea
And, lifting, drips pale fire and green. Oh how
Can life be ever as before to me?

And will your kiss delight me as of old
Whose lips have felt the sea's salt, fierce caress,
Oh, shall I find your love-making grown cold
And wearisome your talk and tenderness?
And long and long for the grey, open sea
And the untainted wind upon my mouth.
To know again the infinite, deep peace
Healing my soul like cool rain after drouth.

Notable Books

TO review a story by Mr. Joseph Conrad is always difficult no matter how short it may be. It is packed so full of life; it is so provocative of discussion; you are not satisfied with what he tells you, no matter how detailed it may be; there is always something more you want to know. It is like meeting, by chance, an entertaining fellow in a lonely resthouse in some out-of-the-way corner of the East: You sit up all the night listening and talking; in the morning you go your separate ways, and the rest of the day you curse yourself for a fool for not raising this question, not asking for that further fact, or, perhaps, for having interrupted just as he was painting a vivid scene. These feelings are strongly roused in his newest book, *Youth* (Messrs. Dent and Sons, 5s. net). It contains three stories; the first has as its full headline, *Youth: A Narrative*. Those who know Lord Jim, will be peculiarly interested in this narrative because it is exactly the obverse of the main incident of that masterpiece. Jim, a well brought-up young Briton, deserts his ship and her living freight of pilgrims in a moment of temptation. Here a crew of Liverpool scallywags, with funny old things as officers, stick to a burning ship until she blows up, just to save her for the underwriters. Why? Mr. Conrad tries to explain. In reading the passage, remember it is not an Englishman who writes, but a son of Poland:

What made them do it—what made them obey me when I, thinking consciously how fine it was, made them drop the bunt of the foresail twice to try and do it better? What? They had no professional reputation—no examples, no praise. It wasn't a sense of duty; they all knew well enough how to shirk, and laze and dodge—when they had a mind to it—and mostly they had. Was it the two pounds ten a month that sent them there? They didn't think their pay half good enough. No; it was something in them, something inborn and subtle and everlasting. I don't say positively that the crew of a French or German merchantman wouldn't have done it, but I doubt whether it would have been done in the same way. There was a completeness in it, something solid like a principle, and masterful like an instinct—a disclosure of something secret—of that hidden something, that gift of good or evil that makes racial difference, that shapes the fate of nations.

It is rather a long passage to quote, but we make no apology, for this is a riddle that has ever perplexed workers in the wilds. What is this secret potency that keeps a Briton true to himself? It is pleasant to know that this strength is not of our own imagination—not mere self-conceit; that this racial driving power does, in truth, exist, otherwise it could not have presented itself to Mr. Conrad. Any observant person who lives any time in the outer parts of the Empire is aware of it. It expresses itself in all kinds of queer ways, and it was the knowledge of "this hidden something" that prevented such men before the war subscribing to the theory of racial decadence. They believed that only the occasion was wanted for "the hidden something" to shine forth and be revealed to all men. The war has justified this faith.

* * * * *

Heart of Darkness, the second story, is a weird tale of the Upper Niger. Mr. Conrad's marvellous gift for creating atmosphere has never been used to greater effect. You feel the menacing vastness of the inert, slowbreathing mass of impenetrable jungle; you can smell the river mud; if you have had malaria, you will almost anticipate the shivers. The human, almost inhuman, beings that dwell there live for you. For the present reviewer this story will always have a curious personal interest. He was reading it when an air-raid was on, and just as out of the *Heart of Darkness*, out of the gloom of the jungle, a spear was thrust and the steersman fell dead at Marlow's feet, so out of the white invisibility of the moonlit sky, the same spear was being thrust, careless whom it pierced. It was as though London were in the savagery of Central Africa. This story is also notable for the following passage:

No, I don't like work. I had rather laze about and think of all the fine things that can be done. I don't like work—no man does—but I like what is in the work—the chance to find yourself. Your own reality—for yourself, not for others—what no other man can ever know. They can only see the mere show, and never can tell what it really means.

Has ever the value of work to the individual been more graphically or tersely described in the English language?

It is so intensely true, although, unfortunately, it is a truth that is too often overlooked or ignored if it has not been mastered in youth, before artificialities and conventions obscure in men's minds the realities of life.

* * * * *

Two distinct aspects of the Near East are given in *The Rise of Nationality in the Balkans*, by R. W. Seton-Watson, (Constable 10s. 6d. net) and *Home Life in the Balkans*, by Lucy M. J. Garnett (Methuen 10s. 6d. net.). The two are complementary, for, while Mr. Seton-Watson is concerned with a deeply interesting history—which he presents with as little bias as is possible in dealing with Balkan matters—Miss Garnett, in detailing the folk-lore and superstitions of the various Balkan races, affords insight to the varying customs of the people whose history Mr. Seton-Watson has so ably summarised. She gives the key to the characters of Greeks, Bulgarians, and Albanians, and from her study of the inner lives of the people it is possible to realise how truly Mr. Seton-Watson remarks that "in approaching Bulgarian history, and above all, the relations of Bulgaria and Serbia, it is well to remember that the two nations are to-day in very much the same stage of development as England and Scotland in the fourteenth or fifteenth centuries." That this is well said is evident from even a cursory survey of Miss Garnett's work, which shows these people as superstitious children of nature, almost devoid of the civilisation of which the progress was suspended in Eastern Europe when Byzantium fell to the Turk.

* * * * *

Mr. Seton-Watson's historical analysis, to which Miss Garnett's work affords such admirable illustration, is not only of value to the student of Near Eastern affairs, but also to all for whom the Balkan races and their future have the slightest interest; for the book clears up the muddle in which, for the average person, Balkan affairs are involved. It is, in all conscience, a weary enough tangle of wars and intrigues of which the author has to tell, but with admirable impartiality he goes down into the causes—mainly the selfish intrigues of the Great Powers—of Balkan discontents and feuds, sorts out the little wars between the various States, and, bringing his story up to the end of the second Balkan war in 1912, sets out the position in which the Hohenzollern dynasty found means to bring about the world's greatest war. The great value of this work—for it is undoubtedly of great value—is that it makes easily accessible a statement of deeds and aspirations alike of all the Balkan States, and incidentally also states the criminal selfishness of the European Powers which restricted these little nations at every turn. "The maintenance of Turkey had become the fetish of British statesmen," and, even more significant with regard to the Crimean war—"It was an irony of fate that the blackest of autocrats and reactionaries should have fought the battle of liberty against the Liberal Powers of the West," are sentences in this work worth remembering. And, again, "The Great Powers, in propping up the Sick Man upon his pillows and in blocking, whenever possible, the movement for the liberation of the Balkan Christians, had set themselves to fight the stars in their courses."

* * * * *

An excellent bibliography concludes Mr. Seton-Watson's work, which clearly points the need for some measure of honesty and of at least an attempt at understanding of racial ambitions, and the rights of people rather than their governors in settling Balkan questions in future.

The Road to Loos, the picture which appears on the opposite page, is an excellent example of Captain Handley-Read's exceptional gifts. We see here the wreckage and waste of war. It is a pitiful picture, and the strength of it lies in that the spectator realises it to be absolutely true to life. This power of envisaging a scene is perhaps the main reason that makes Captain Handley-Read's work stand out so prominently. This truth has been recognised by the National War Museum which has bought a number of his drawings. But there is not a single picture in this five-guinea Portfolio which does not exemplify this exceptional quality.

By Captain F. Handley-Read

The British Firing Line: The Road to Loos

We reproduce another drawing from the British Firing Line Portfolio by Captain F. Handley-Read. The Portfolio contains twelve engravings in colour, with an Introduction by Hilaire Belloc, and is printed by George Pulman and Sons, for the Leicester Galleries. Copies of this Portfolio may be obtained, 5s. each, on application to The Publisher, "Land & Water," 5, Chancery Lane, W.C.2.

THE FARMER'S JOB

TO begin with, let it be said that the last word of this headline reads *job* not *Job*, for to write of British agriculture always rather implies that the subject matter deals with a lineal descendant of the most patient man who ever lived. The speech which the Minister of Agriculture delivered before the Farmers' Protection Association at Darlington last week is the most statesmanlike utterance that has been made on the subject for many years. We cannot help thinking that Mr. Prothero had before his eyes not so much his immediate audience as the hosts of town-dwellers who are looking more and more to the local countryside for their food. He has made it clear that agriculture to-day—profitable agriculture that is to say—is a most scientific industry, and that the husbandry of our comparatively restricted area of ancient tillage is interdependent on the whole conduct of farming. To stimulate corn production, highly fed cattle are necessary; and ploughland is needed for an increased output of milk. These are two rudimentary illustrations of the nicely adjusted operations of agriculture. The keeper of flocks and the tiller of the ground are the two oldest and most jealous types of agriculture, but to-day if Cain slays Abel, if the husbandman wages war on the herdsman or *vice versa*, the whole country must suffer, for the operations of the two are correlated.

Do people, I wonder, realise the extra cost of cutting corn which has been flattened by rain and twisted by wind? Do they recognise how much a man is out of pocket if he has to bring his men and horses into the field day by day, and send them home after waiting for hours because it is raining? Do they consider that, this year, after the corn has been gathered into sheaves, it has often been necessary to scatter the sheaves again, and even to untie the bundles in order to give it a chance of drying? Do they think of the quantities of seed that have been shaken out of the ear and lost, or the amount of corn that is damaged or sprouted?

Do they? Little if at all. But these few questions put by Mr. Prothero will bring home to the general public the difficulties that confront the farmer, especially in this present year when the broken weather of August and the first half of September are fresh in the memory. For tens of thousands the rain during those critical weeks meant spoiled holidays, they did not pause to remember it also implied ruined harvests, the loss in cash of thousands of pounds to farmers, and eventual loss to themselves through the increased cost of food. There was no real cause why they should think otherwise. Until a year or two ago a field of wheat ripening red-gold beneath the hot sun of late summer was merely a pretty sight to thousands of town-dwellers; it had no connection with the bread upon their tables. This year they might weeks later have re-visited the same fields and found the sheaves still lying there, black and rotting and the grain sprouting; this has happened more than once this century in exceptionally wet autumns. The sight formerly was for them an ugly one, but nothing more, for their flour-tubs were

always full, fresh-baked loaves ever on their boards at a low price, since the granaries of the world poured their surplus into the country through our unmolested merchant fleets. But at last the townsmen are learning that English fields are in truth as necessary to their well-being as English factories, and they begin to comprehend that the farmer is as valuable a unit of national life as the manufacturer or banker. Presently they will learn that in some respects he is even more essential.

The Ministry of Agriculture has a difficult rôle to play. It has to offer every encouragement to the farming interests to augment production, but it is unable to fix prices which from a business point of view is the most essential detail of all. Mr. Prothero did right to dwell on this point in his speech, and we regret his remarks should have been made the occasion by certain political journals to foment jealousy and trouble between the Ministries of Agriculture and of Food. Fortunately the Heads of these two Departments are neither of them Party politicians, both practical men, who have escaped that form of neurasthenia which seems at times to paralyse the will power of those who have passed long years in the infected atmosphere of the Royal Palace of Westminster. The Ministry of Food had previously made concessions in the price of milk, and yesterday it did the same over meat. Neither Lord Rhondda nor any other reasonable being expects the whole burden to fall on the producer; the consumer is willing to bear his share of it.

Mr. Prothero is a believer in decentralisation; he is doing his utmost to push forward the work he has undertaken through local Committees to whom he paid a well-deserved tribute of gratitude. He has set before British agriculture a not impossible task; he asks them in 1918 to equal the corn production of 1872. Of course this is dependent on the weather, but if farmers will meet his wishes and put their backs into the job, there is no reason under fairly favourable circumstances why it should not be accomplished. Mr. Prothero, who has always been most outspoken on the question of food supplies, did well to remind us that peace will not bring plenty in its immediate train. When war ends, we shall be short both of money and of ships. In all probability, corn will be scarce; certainly it will be dear to buy and difficult to carry. The more corn, therefore, that we can grow in this country, the better able we shall be to feed our people, and the less we shall be forced to buy abroad, the more money we shall keep in these islands, the more ships we shall set free to bring over those raw materials of manufacture on which millions of townsmen depend.

This is a vital fact the consumer will do well to bear in mind. Germany still comforts herself publicly with the thought that England is to be compelled to sue for peace through the success of her submarines. Privately, those responsible for this campaign are aware that up to now it has been a failure, just as we here know it to be. But this failure can only be absolutely assured if the people of these islands continue to practice rigid economy. Waste or extravagance in living might even now do for the country what German naval "frightfulness" has failed to achieve. Each one of us has to regulate his consumption of the necessities of life as though we lived in "a beleaguered city," to quote Mr. Prothero's own comparison.

It were well to repeat the exhortation to farmers with which the Minister of Agriculture closed his speech at Darlington:

The task which is set to farmers and labourers will test their grit to the utmost. They are on their trial before the eyes not only of this nation but of the Allies. Heavy odds are against them. They are handicapped by the want of skilled labour, by the shortage of fertilisers, feeding stuffs, horses and implements, by the interferences and uncertainties which follow in the train of a colossal war. But every added quarter of grain, every extra pound of meat, every additional quart of milk will help to turn the scale in the nation's favour. No greater responsibility has ever rested on the inhabitants of these islands than that which rests to-day on those who cultivate the soil.

This exhortation is admirable, but it would be foolishness to assume that the present food situation will only test the grit of the farmer and labourer. There is not an inhabitant of these islands, who has not a part to play in this mighty trial of strength. But Government ought to take immediate action to prevent the swarms of selfish and cowardly aliens from defeating the object in view. So long as these creatures have money they consider they have the right to buy and consume food freely. It is a serious danger.

The War Haig's Third Blow

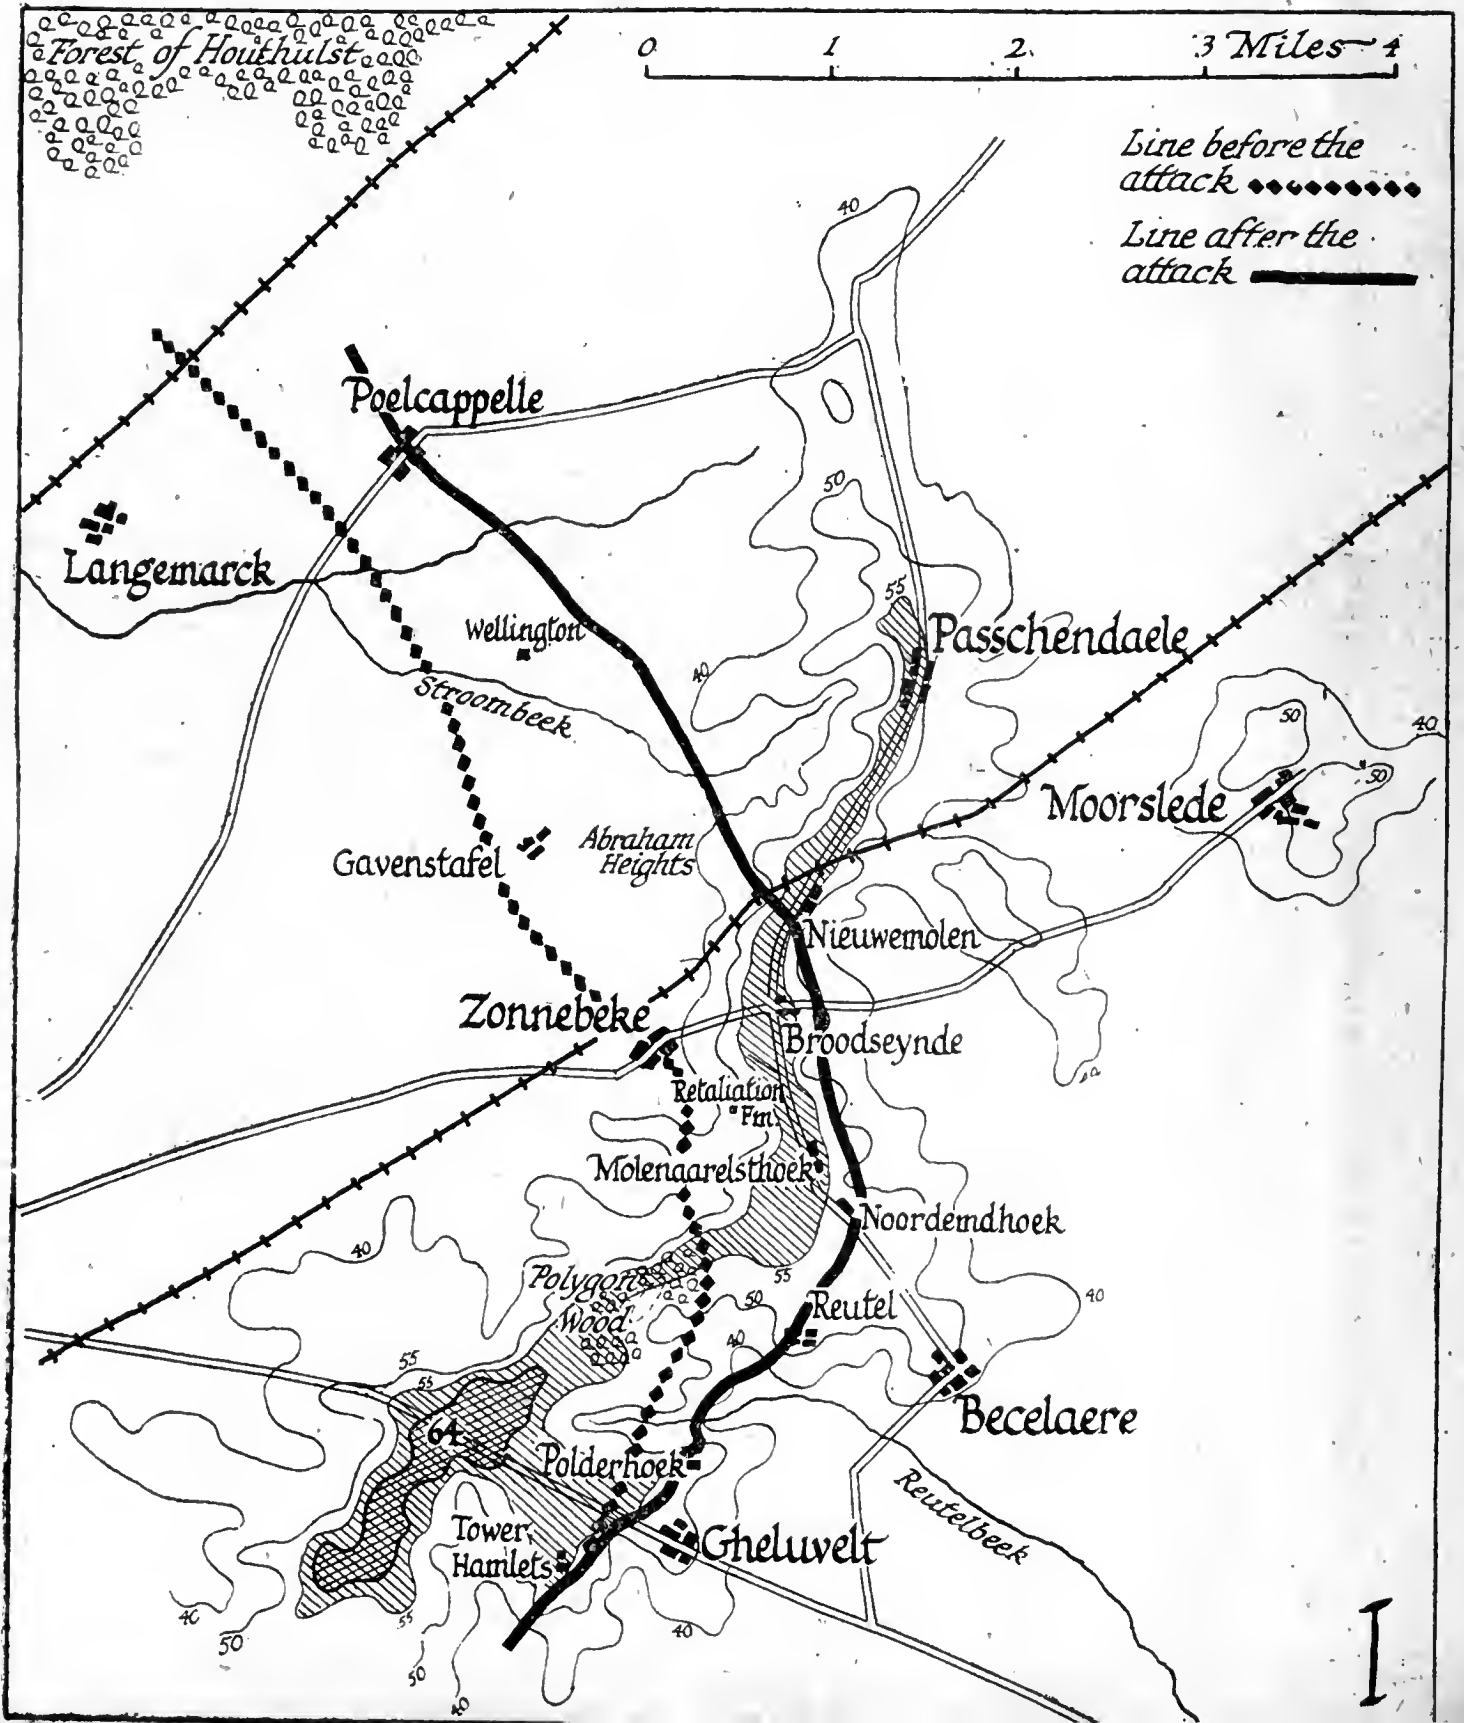

By Hilaire Belloc

ON Thursday last, October 4th, Sir Douglas Haig delivered the third of those successful blows, each with its strictly limited objectives, which are at once mastering the Passchendaele Ridges and wearing down the German forces opposed to them. Again we note the rapidity with which the preparation for the action was made. The first use of the new tactic was made upon September 26th. The interval between the first and the second blow was five days, and the interval between the second and the third seven. Such rapidity of preparation is a new thing in this war and is of very good augury for the future.

The line seized by the British forces at the end of the second blow, that delivered upon Wednesday, September 26th, and consolidated upon Thursday, September 27th, ran from

well in front of Langemarck through the middle of the ruins of Zonnebeke, covered the Polygon Wood on the eastern boundaries of which the new British posts were established and further south crossed the Menin Road along the 55 metre contour, including the whole of the Tower Hamlets Ridge. That line, it will be remembered, corresponded roughly, at its southern end, to the old third German trench line, no longer held as a trench line, but organised in a string or rather chequer of blockhouses—organised waters and ruins.

As regards the Passchendaele Ridge, the seizing of which is the immediate object of these successive steps, what had already been accomplished was the complete capture of its southern pillar, the approach at Zonnebeke to a point about a thousand yards from the summit of the ridge (marked by

the Broodseynde cross roads), while between Passchendaele village itself and the British line at its nearest point there was a distance of rather more than 3,000 yards. This last action has changed the line as follows:

On the southern end, upon the Menin Road, the British line has got right down the further slope to the outskirts of the village of Gheluvelt. It has carried the whole of the bank in front of Zonnebeke, seized the ridge at the Broodseynde cross roads, and occupied the summit all along the Paaschendaele road to a point 1,000 yards up that road northwards and a little short of the passage of the Roulers Railway across the ridge near the hamlet of Nieuwemolen. Further north, the spur called the Abraham Heights by the British army, has been seized; also the ruins of the hamlet of Gravenstafel and those of the village of Poelcappelle some two miles east of Langemarck. The general result is, first, the complete clearing of the southern pillar, the heights in front of Gheluvelt and the highest part of the ridge. The summits here were seized when the first blow was delivered a fortnight ago, and now the slopes on the far side are securely in British hands. In the centre the change is still more striking. There the Broodseynde Cross roads in the very centre of the ridge are held and passed, and from this point, though it is but 50 or 60 feet above the plain, one sees all Flanders. It is a clean view broken only by the isolated lump of Moorslede, which is of the same height as the Passchendaele Ridge and about two miles from its summit. The command of Broodseynde connotes direct observation of a sort which had not yet been seized since the present actions began, and which may be compared to that obtained when the Vimy Ridge was carried last spring. There now remains nothing save the northern edge of the ridge on which the ruins of Passchendaele are perched to be occupied. Meanwhile another feature in the advance which will not be missed is the serious increase of the salient now driven into the German positions. That salient cannot become much deeper without compelling the enemy to modify his line and that is, of course, the object of the whole movement. If or when British forces seize the whole ridge and the slopes upon the eastern side, the strong defensive position which the enemy has ultimately depended upon the whole of this autumn with the forest of Houthulst as its northern pillar and the heights of Gheluvelt as its southern one, will have gone. To what kind of retirement the enemy may later be compelled is a matter of conjecture save to those who have the advantage of seeing the photographs taken by aircraft behind the enemy's lines. The French Press has given us the mention of a new line which, it seems, is being prepared as far back as Roulers, but one has only to look at the map of Western Belgium as a whole to see the grave political and perhaps strategical importance of compelling a retirement here and to understand why the enemy has fought so very hard to maintain the heights, which he is gradually losing.

Importance of Lille

The great importance of Lille, both politically and strategically is now familiar to everyone. It is the necessary pivot upon which any further retirement to the south of that town must be conducted, and its long occupation has formed a political asset of the gravest sort. To the north Ostend and north of Ostend Zbrugge have a value to the enemy which only those can estimate who are acquainted with the maritime problem, which I do not pretend to understand. But it is universally granted that the possession of this strip of the Belgian coast is of special advantage to the enemy and a corresponding weakness to ourselves. Now if the salient in Flanders be much further advanced, if it is true that the line in the neighbourhood of Roulers is being prepared as the next defensive chain of positions, the position of Lille becomes difficult, and so does that of Ostend. We must not build too much upon a mere geographical consideration of this sort and, of course, the mere occupation of the ridge would not in itself provoke a retirement, it does not represent so pronounced a salient as all that. But even if the salient were pushed right on to the plain beyond, the war has taught us what extraordinary positions can be clung to by the modern defensive. On the older principles anyone would have said, for instance, that the breaking of the Austrian line on the mountain plateau north of Gorizia would have involved a general retirement to the south and perhaps even have uncovered Trieste. Under modern conditions nothing of the sort has happened. Half the plateau has been lost, but the line to the south stands as securely as though no such movement had taken place. What is perhaps of more importance is the very serious losses inflicted upon the enemy by this action. These losses were far graver than those of the two previous actions, and the cause of so exceptional a casualty list was the fact that the enemy was caught by the British advance in the act of preparing a great counter-attack.

Three German divisions had been concentrated during Wednesday night for a counter-attack to be delivered apparently a couple of hours after the moment for which the British advance was planned. There was here apparent the drawback to the new defensive tactic which the enemy has developed in the course of the late summer and autumn. The policy of holding the front line with as few men as possible, of depending upon isolated strong points, of organising the craters and abandoning the older trench system, saved both men and material whenever the immense superiority of the British artillery asserted itself. But it compelled the enemy to increase his depth and to mass both more slowly and further off for his counter-attacks. They lost by this in their power to surprise and correspondingly increased the power of their opponents to surprise, and such a surprise they suffered upon this Wednesday morning. Everyone of these three divisions or, at any rate, of their attacking troops crowded on the narrow front between the Reutelbeek and the neighbourhood of Zonnebeke was caught first by the British barrage and next by the advancing infantry. The German attack was planned for six o'clock. It was organised upon a two-mile front from near Zonnebeke to the southern limits of the Polygon Wood, and its three divisions were in their order from north to south the Fourth Guards Division, facing Zonnebeke; south of this the 45th Reserve Division north of Polygon Wood, and (apparently) opposite Polygon Wood the 16th Division. The enemy put over a barrage at half-past 5 preparatory to his attack. The British barrage opened shortly after, completely disarranged his plans and the British troops were right in the midst of his concentration before the surprise was fully appreciated.

Details of the Attack

The British advance was so far as one can judge from the correspondents in the following order:

On the extreme left, north of Langemarck, Irish troops, Fusiliers, worked forward along the railway embankment through very bad marshy ground; next to them on their right were troops from the Midlands, who also had difficulty with the ground, but none the less took and held the ruins of Poelcappelle. To the right or south of these again New Zealand troops carried Gravenstafel and the low spur called the Abraham Heights. Somewhere where the Midlands and the New Zealanders touched there was a particularly difficult piece of marshy ground on either side of the Stroombeek and one of the points of resistance most remarked was the German machine gun position in the ruins of Wellington Farm. This was carried, however, and the line advanced as the sketch map shows, some hundred yards beyond. In the centre of the region of Zonnebeke and down to Polygon Wood where the German attack was to have been delivered, were the Australians, and to their right again, from Polygon Wood to the Menin Road, were English West Country troops and more Midlands. But I am not clear whether there were not English troops also to the north of this with the Australians, for I note that one correspondent talks of English troops from the Midlands having carried Noordemhoek, having difficulty with the resistance the enemy put up at Retaliation Farm.

The German order of battle, apart from the three divisions just mentioned, who were to have taken part in the great attack, consisted, on the north of the Zonnebeke region and apparently opposite the New Zealanders, of the 20th Division recently brought West from the Russian front, and beyond them to the north again the 10th Ersatz. To the south, beyond Polygon Wood there was, on the German side, a curious situation. The German line here, up to the Menin Road, seems to have been held by the 19th Division of Reserve recently brought west from the Russian front. But apparently they were being relieved at the very moment of the battle by the 8th Division. There was consequently very great confusion; prisoners from both divisions were taken freely and the units appear to have got hopelessly mixed.

But for the matter of that, confusion was the note of the enemy's line almost everywhere after the first shock, and particularly from Zonnebeke southwards where the German attack was to have been delivered had not the British forestalled it. The considerable concentration of men here, caught first by the barrage and then by the advancing infantry, accounting as we have seen for the very heavy losses, and also for the complete disarrangement of the enemy's plans.

When the enemy re-acted, his main effort was made, as might have been expected, against the southern wing between the Polygon Wood and the Menin Road where he has always thrown in the greater part of his strength. There were no less than six counter-attacks in this region between three o'clock and dark on the afternoon of the first day's fighting, the Thursday, and another strong counter-attack on the morning of the Friday after very heavy shelling all night. The total result of this pressure exercised upon the British

troops was to compel the evacuation of the ruins of Polderhoek Chateau which the British had taken upon Thursday and the creation of a little dent or re-entrant along the course of the Reutelbeck. But beyond this there has been no modification of the line which has been everywhere held and consolidated. The enemy issued a curious, vague and short despatch after the action, one phrase in which should be retained. He said that the British had not reached their objectives which were "doubtless" distant. Stuff of that kind can hardly deceive the simplest newspaper readers within his own country and it is quite valueless for any other purpose. The character of the new tactics is now perfectly plain to everyone—repeated blows with limited objectives; and the two steps of Thursday's advance were exactly like those of the week before and the week before that, save that the success was secured at a greater expense to the enemy. As an example of what is meant by these limited objectives, a very good case is what happened north of the Broodseynde Cross Roads. The Australians here went along the Passchendaele Road as far as Nieuwmoen and beyond that point nearly to the railway, and then came back of their own accord to the objective assigned to them, which was only one thousand yards north of the Cross Roads.

The total number of prisoners taken in the action was close on four and a half thousand.

THE BATTLE OF RAMADIE

The further details received in London, describing Sir Stanley Maude's very complete success on the Euphrates, confirm and expand what was said here last week. Mr. Candler has sent a despatch dated on September 29th which describes how an advance camp was formed commanding the bridge-head on the western side of the Euphrates opposite Feludja. Two columns left this camp in the night of the 27th and attacked the Mushaid Ridge a little before daybreak, while at the same time the watercourse from Habbaniyah Lake to the river at Ramadie was crossed by an advanced body. The cavalry made an eight hour march round westward and at four o'clock on the Friday were on a line of hills at X on Map II., 5 miles west of Ramadie running perpendicular to the river. By this move the Turkish troops in Ramadie were completely cut off from their communications; their only chance was to

try and break through, in which attempt they failed, the worst of their attacks taking place apparently in the night up to the dawn of Saturday against the cavalry holding the heights to the west. It was apparently in the course of the morning that the Turkish troops, thus enclosed everywhere between the British and the river, surrendered to the number

of 3,310 men and 145 officers with 13 guns and much other material. An interesting point in the account is the mention not only of railway material but "several miles of line." This suggests the completion of a railway up to Ramadie down the Euphrates valley of which the public has as yet heard nothing. But doubtless we shall have further information upon this point in the near future.

The Conditions of Victory—I

I PROPOSE in this and following articles to discuss the policy which consists in proposing hypothetical terms of peace, to show that this policy is necessarily favourable to the enemy and may be disastrous to ourselves. I propose further to show how it could be and should be replaced rather by an analysis of the conditions, not of peace, but of victory. For though the end of war is peace and certain conditions of peace are the sole political motive of any war, yet to parley before a decision in the field has been arrived at has always been, and must necessarily be, the policy of the party which is approaching defeat, and the refusal to parley is equally the mark of the party which is confident of victory.

First let us consider the character of the campaign which has been started for the discussion, not of the conditions of victory, but of terms of peace:

The German and Austrian Governments and those who sympathise with them in various degrees at home and abroad began, after the loss of their defensive power following the defeats of Verdun and the Trentino, to start a discussion upon the terms of peace. The German Press was given the hint; the Polish Jew Wittowski, who is the agent of the German Government in these matters and, through his brother, one of their principal links with international finance, was given the task of writing it up under his pseudonym Maximilian Harden; the agents of the Central Powers and their dupes in every belligerent capital started the discussion of the terms of peace as a sort of newspaper topic, planted it carefully, watered it assiduously and watched it grow.

If you want to study the phenomenon in detail you cannot do better than note what happened in the American Press, especially in that section of it which the French would call "The Intellectuals," and which the Americans themselves with characteristic humour call "The Highbrows." Long before the United States entered the war those who write for these papers were in full blast upon "The Terms of Peace." I have already cited one of the most prominent of them called *The New Republic*, which also boasted the useful aid of men of the same kidney writing in this country. The tip that had been passed round was to blame the German Government for this or for that, even to say that such and such a policy or

such and such an excess merited the interference of the United States, but at the same time introducing three novel considerations in favour of the enemy, the familiarising of the public with which was the real motive of the whole manoeuvre.

Here are the three novel suggestions which were to do the work of the enemy, and which it was the business of his friends to turn into familiar commonplaces by perpetual repetition.

(1) The suggestion or rather the affirmation that the German people were innocent of the war and its crimes, and suffered from the oppression of wicked rulers whom alone we were concerned to defeat.

(2) That the German armies were so strong, their rate of loss so slow, and the genius of their leaders so great that to defeat them in the field was impossible; or, at any rate, not possible without the ruin of Europe as a consequence;—yet (oddly enough!) that their inferiority was sufficiently marked to make it worth while for them to negotiate.

(3) That the words "Victory" or "Defeat" were the terms of loose thinkers being (what indeed they are) general terms, and that the practical and statesmanlike thing to do was to discuss in great detail with concrete instances exactly what political points were aimed at by the Allies. Such discussion these writers would undertake and, as we shall see later, invariably to the disadvantage of the Allies and to the advantage of their German friends.

No one who has watched the phenomenon as it has grown up during the last eighteen months can doubt either its origin or its nature. As is always the case with such movements, the great mass of those who support this one are dupes, but most of them are dupes whose minds were well prepared for acting the deplorable and sometimes treasonable part which they have been called upon to play. But behind the dupes and conducting the whole affair, there is a much smaller number of men who are the agents. In other words, things of this kind are not subconscious movements of opinion; they are organised policies to which modern conditions with their instantaneous communications and their rapid diffusion of suggestion through the Press particularly lend themselves.

As this last point is at once vital and will appear to many doubtful, I would like to dwell upon it for a moment and establish it. For many novel discussions—I should say by far

the greater part—are the spontaneous expression of opinion. They are no doubt canalised and used once they begin, but most of them spring, not from leaders, but from the crowd. The ways in which you can tell a movement which is not of this nature, but is engineered from its origin, the tests of its artificial character, are as follows:

It has no gradual process of development. It arises suddenly and exactly at the moment convenient to its authors. It throws out no branches naturally as spontaneous opinion does, but perpetually repeats set phrases which have been given it and is careful to limit itself to those phrases lest it should disobey orders. It exhibits with mechanical precision the sudden suppression of the older policy which it has succeeded.

Tests of Artificiality

Now by all these tests the discussion of "Terms of Peace" while the war is yet undecided is an engineered and artificial policy. It was not of slow growth; it began all over the world just at the moment when the last German offensives were defeated. It began just when the enemy's Higher Command knew that for the future it had to be entirely on the defensive, a thing, be it noted, which the Allied Higher Command could not know for some time, and which your journalist or politician could not guess at within a margin of error of some months. At the same time, the old policy, which was to talk of Germany as brutally attacked by wicked men and of her moral right to do what she did, was completely dropped. It was kept strictly for the home press and disappeared entirely from the press of neutrals and opponents. Further, throughout the whole movement from its origin, there has been that curious note of ceaseless repetition, unexpanding, undeveloping, mechanical, and depending upon fixed phrases, most of which can actually be traced to an origin in Berlin.

This apparently sincere and apparently reasonable discussion of "terms of peace" is one of the few clever things which the agents of Berlin have done since the Marne. Most of their actions have been foolish; the most remarkable examples of folly being their neglect in the use of cipher and the consequent discovery of their diplomatic movements. Their first policy, which ran from the defeat of the Marne to the beginning of the Somme, was also less able, for it consisted in saying things that no one could possibly believe, such as that the war had not been made by Germany, and that the desire for conquest was not in the Prussian nature. But this second policy is an able one, and if we do not look out it will succeed in defeating the Allies. It has very powerful forces on its side because it appeals in the most winning manner at the same time to fools and to knaves. The financiers who have no national interests and who naturally want an inconclusive peace (if only from the fact that their fortunes cover both sides and that a decisive victory would ruin one of those sides) are strong supporters of this discussion of terms of peace, and the great mass of unthinking men are attracted to it in all sorts of ways. It looks so innocent! However good a patriot you are there can be no harm in stating your terms. After all, all war is fought for political objects of some sort, and to fight without stating them is to fight in the dark. What we desire after the war is a stable peace and any constructive work towards it must be begun by way of definition before the war ends, etc., etc.

The briefest examination, not only of the dates which mark this new policy but of its character, will convince us that these plausible arguments do not represent its true motive at all. The motive is to save the Central Powers, and in particular the German Empire, from the punishment due to the crimes of this war, and to leave their strength intact for the future. In a word, the object of the whole affair is to save Prussia.

Look at the movement in some detail and you will discover how true this is. Let us take it point by point.

The first feature in the plan is to distinguish between the German people and their rulers. The thesis is that the German Empire is a country in which popular opinion does not exist, or if it exists is brutally suppressed, and that the great mass of men in that Empire are compelled unwillingly to wage war and even to commit atrocities in war by monsters who bear the names sometimes of "the Kaiser," sometimes of "the Junkers." Personally I prefer the English words the German Emperor and the Squires, but no matter. Side by side with this thesis you get the corollary that if the Germans were to throw off this heavy yoke and become something called "a democracy," we should no longer have any quarrel with them, and we could all settle down to a comfortable millennium.

Now the main thesis here can only hold water with those minds—unfortunately not uncommon in our modern civilisation—which accept a secondary impression such as printed words and reject a primary impression such as the evidence of their own senses. No one could travel in modern Germany

for so much as a week-end without discovering the utter unreality of the idea that the German peoples are the unwilling slaves of an unpopular tyranny. It is the wildest nonsense. The Prussianised German Empire is the most homogeneous State in the world. It likes its form of Government; its form of Government suits it, and even where there is criticism it is essentially "the criticism of the household." There is no shadow of real opposition to or real dislike of what is an essentially national and to them satisfactory form of government. The Federal Constitution, the large local autonomy, the long established hereditary families, and the dynasty of the Hohenzollerns at the head—every part of the organism is thoroughly popular and strongly supported by the people. We may, and it is to be hoped that we shall, destroy this organisation precisely because it is strong. Its strength has very nearly meant the undoing of Europe. But to say that in destroying it we are giving back freedom of national expression to the Germans is a falsehood. They have never had so high a power of self-expression nor have been so truly themselves as in the present war.

Take the corresponding statement that the mass of the German forces did evil only under orders and not through a spirit pervading the whole people. It is equally a monstrous figment of special pleaders who wished to save that people from what they now see to be an approaching punishment. Of all the myriad testimonials carefully sifted and docketed by the French and English authorities for use at the conclusion of the war, there is hardly a trace of reluctance; there are innumerable examples of satisfaction and delight. From the first massacre of civilians upon the very frontier of Belgium, through the butchery of innocent people in Louvain, in Liege, in Dinant and in fifty other places more obscure, up to the latest murder by sea, the last wanton shelling of men in open boats, the tale is always the same. The German soldiery act thus because it is the national conception of war. They are applauded for acting thus by their civilian population between whom and them there is no distinction at all; they will act thus whenever they have the power so to act in the future; it seems to them the most natural thing in the world. The bestial acts of defilement which marked the whole advance up to the Marne, were the jests not only of the officers but of the private soldiers of the German Army. You will look in vain even at the worst cases for any sign of reluctance. The man whose sport it was to shoot at the drowning women in Sermaize was not a man acting under orders; he was a German private, acting as innumerable other German privates have acted before him and were to act after him. The man who methodically shot off the lock of the tabernacle in Gerbeviller Church in order to steal the sacred vessels was not acting under any orders; he was out for looting an altar; he was doing what he had always understood was the proper thing to do in war. One can know nothing at all of human nature if one believes that vileness of this kind is cured by the signature of the perpetrator to a bit of paper or by his mere promise to amend. It is cured by punishment, and if the punishment cannot be inflicted it is not cured at all. If it is not cured there is no future for Europe.

Democratic Prussianism

The corollary to this strange doctrine of a charming but oppressed German people whom we are to set free to follow their kindly instincts is equally false. That corollary pretends that something called "Democracy" being established in Germany, the men who have committed these crimes and delighted in them will suddenly change and establish a millennium of peace.

It is remarkable that no definition of Democracy ever follows this repeated statement. Sometimes, indeed, one of the more naïf of the pleaders for Germany tells us that it means a Parliamentary system of Government! That can hardly be considered seriously. No one can say seriously after the experience of the Parliamentary countries that government by the professional politician and the Caucus is more popular or more represents the direct action of the people than do the present institutions of the German Empire. If what people mean by the use of this word "Democracy" is the spreading of the democratic spirit in general—a spirit which is not at all native to this country but which is that of a majority in France, and certainly of nearly everyone in the Colonies and the United States—all one can say is that such a term has no relation to the present war. England is fighting a people which deliberately challenged Europe in the hope of an easy conquest and proceeded to degrade war to indiscriminate murder—accompanied by every other abomination they could invent for spreading terror or satisfying their appetites. What can it possibly matter whether such an enemy profess this or that system of Government?

But even if it did: even if you hold democracy to be a

religion, how can you conceive its sudden acceptance by the Germans? In what way is such a spirit to be proved? What act upon the part of the German people will be the outward sign of such an enormous revolution? And even if by a miracle, the like of which has never been known in the history of the world, a race with a certain character developed through hundreds of years were to adopt a character wholly foreign to it in a few weeks, why on earth should that guarantee us either a permanent peace or a justly organised Europe? If anyone says that democracies do not make wars or do not commit evils he is talking nonsense. Democracy is sought as an act of justice. The argument for it is that it gives freedom to the will and that such freedom is a civic right. It is not sought as a spiritual salvation. No one would be so mad as to say that it made the will holy. The whole point of evil is the freedom of the evil agent, and a society which has adopted the democratic theory, that is, which acts by the expressed will of the whole community, may perfectly well use that will for oppression or for rapine, as it may use it for the opposites of these evil things. Democracy is only one of many theories of government: democracies have in the past, and will in the future, commit monstrous acts, and there is no one, however attached to the theory of democracy, who has been so foolish as to pretend that it destroyed man's propensity to evil. Those who quote Rousseau in this connection cannot, I think, have read that great writer or have read him in some very faulty translation. At the very outset of the "Social Contract," which is the strongest exposition of democratic theory in existence, its author remarks that such a government is far too good for men.

The plain truth in the matter is this. There is a State in Europe, the citizens of which have for long manifested a will, which will, in its effect is, by all European standards of morality and tradition, extremely evil. It has been, unfortunately, so tolerated as to become very strong, and to command a great body of Allies. It has challenged the civilization of Europe feeling certain of victory. It has failed to achieve that victory. Its manifestation during the struggle has been one of increasing evil, one atrocity added to another as the war continued. The peril of such a will amongst us must be exorcised if we are to live, and the only conceivable way of exorcising it is to break that will by defeating the armed force which is its only weapon. Short of that, this evil survives, and its evil, though it may seem to us to have reached already the very limits of wrong doing, will increase to our destruction. If we do not break it, the future will be all war, domestic and foreign, and a war without conventions, without restraint, degenerated, I repeat, into a doctrine of indiscriminate

murder. No man can honestly say that four years ago he would have thought the massacre of civilians in open towns, the sinking of hospital ships, the deliberate destruction of the greatest monuments of the past, possible. Such things were not in our conception at all in the year 1913. Because we are familiar with them in the year 1917 is no reason for yielding to such an abominable new code. The very fact that we are to-day horribly familiar with them is a direct argument for rooting them out and making them impossible in the future.

I would seriously ask those who still use the arguments I am condemning, to consider a parallel with which they are well acquainted, but which they never seem to consider. How do they act against evils which directly affect their own skins? When an individual arms himself with a bludgeon, knocks down a passer by on a dark night, and goes through his pockets, how does your Pacifist and pro-German deal with that individual? Does he content himself with a promise that the action shall not be repeated? Does he argue that such things have always been and always will be, and are but a necessary inconvenience which reasonable men should tolerate? He does nothing of the sort. The forces of society are put to work to seize the individual in question and he is severely punished. He is put to such great pain as will, it is hoped, drive out of him the desire to repeat his offence and act as a warning to others who might wish to imitate him. If we did not do this to the foot-pad, if we contented ourselves with the sort of reasoning applied to the German Empire to-day by those who would save it from the consequences of its acts, there would be such an outbreak of violence as would break up society.

The parallel is exact, though the case of the chance burglar or garrotter with whom your theorist is in practice so severe, is infinitely less important than the case of a whole State organised among us for plunder and for killing. The threat to humanity which the private criminal represents is nothing compared with the threat represented by a whole society deliberately provoking such a war as this, and conducting it by such methods as these; methods, be it remembered, which the German people heartily applaud. ... H. BELLOC
(To be continued).

The next issue of "Land & Water" will contain a most important article by Mr. Arthur Pollen, who is lecturing in America.

He reviews the past administration of the Admiralty and makes a valuable suggestion for securing the future possible co-operation of the American Navy:

Kerenski and Korniloff

By M. A. Czaplicka

ALTHOUGH the near future may bring still more drastic changes in the home government of Russia, and although it is not too much to suppose that the most extreme group may rise to the crest of the wave that will perhaps sweep over large tracts of Eastern Europe—it is in the Kerenski-Korniloff episode that the most important national and historical problem of the Russian Empire is embodied. The meaning of this conflict cannot be studied too closely, for it will teach the Western world that the revolution in Russia ought not to be viewed merely from the standpoint of the French Revolution. Possibly it will also help to make clear how much more can be expected from Russia during the war and what are the questions that may arise for her when peace terms are discussed.

Ignoring the necessity for deeper study, which would lead to a better understanding of the situation, people hastily divided public opinion in Russia into two categories—more or less revolutionary, and more or less reactionary—and watched anxiously to see which of the supposed parties would be ready to stand the more steadily by the Allies' war programme. And, since it is human to make abstract ideas more concrete by associating them with personalities, it was at first understood that all the revolutionaries might be placed behind Kerenski, and behind Korniloff all those who represented reaction in sympathy with the old regime. These two names seem to embody, as it were, the formulæ of the two opposing programmes.

But then some doubts were expressed at the propriety of such a division, and various questions arose in the Western mind, as, for instance:

"Have not the old reactionaries in Russia been faithful to the Allies?"

"Is it right to welcome a revolution, which, as its most direct result, brings chaos and military retreat?"

"Was the Revolution brought about by the people who wanted a more vigorous prosecution of the war, or by those who, like the Bolsheviki, desire the end of the war at any price?"

Of course, in asking these questions Western Europe overlooks the characteristic mentality of its Eastern Slavonic allies. Although the reasoning faculty is so well developed among them that their tendency to probe into the soul for motives has become proverbial, yet in the Near East all this takes place *after* the act, while the act itself is the result of impulse alone; this very important truth it is which is so often left out of account.

Neither before nor after the Revolution could a definite line be drawn between a reactionary party and a revolutionary party in Russia, nor could Russia's attitude towards her Western Allies be measured by her *credo* in home politics. But at all times both honest and dishonest groups have been found within her, and it is not far from the truth to say that if the old regime had included a greater number belonging to the former type, it could not have been so easily overthrown. It is not so much the form of Government as its corruption that makes the people distrustful of their old masters—a fact that has often happened before.

From such a point of view the Kerenski-Korniloff question might perhaps be better named the "honest-supporters-of-the-old-regime and honest-supporters-of-the-new-regime question." But this also would be misleading, since many of the followers of Korniloff were quite honest supporters of the new regime, who, however, with their anxious cry for order at any price, did not realise that it is futile to pour oil upon a troubled sea while the storm is at its height.

A study of the personalities of the two leaders in the conflict has quite dispelled any illusion that they were acting from personal ambition, or were supporting a programme not in

accordance with the welfare of their country and of Europe. And the fact that one of the leaders is military by birth and training does not necessarily imply that to him the idea of order is nearer and dearer than it is to his opponent, whose legal training and traditional party education were not less indispensable in coping with the situation. Only in method, people thought, was there difference between them. Whereas Korniloff wished to introduce at the Front the discipline which he hoped would afterwards penetrate into the heart of the country, Kerenski believed in first restoring peace at the heart of the country, and thus *ipso facto* restoring the health of the army. Since this was apparently the only difference between the two programmes, people longed for a coalition of these two striking and powerful personalities. So after examining the question sufficiently to prevent them from condemning either one of the leaders, anxious voices were raised asking: "Why not combine the efforts of these two protagonists? Why not have Kerenski at home and Korniloff in the firing line?"

Foredoomed to Failure

It is the main object of this article to put before the reader some possible explanation as to why, even though the two leaders had done everything in their power to avoid conflict, such a combination was foredoomed to failure.

Not in the political difference between Kerenski and Korniloff do we find the main clue. It is true that to a distant observer, the most striking facts are, that before the revolution the one leader was an army potentate and the other the most progressive member of the Duma, and that behind the name of the one, dishonest reactionaries might have hidden themselves, just as dishonest extremists might be lurking behind the other. This does not imply that either of them would refuse to subscribe to the motto of freedom for Russia and freedom for Europe.

However, if not in politics alone, the clue may be sought in those realms where changes are less rapid and differences are more profound and weighty than they are in party strife and distinctions. If we substitute for the name of Kerenski that of the class whose product he is—namely the *Intelligentsia*, and for the name of Korniloff, the term given to the hyper-product of age-long Russian militarism—the *present Cossack class*—then, and then only, will the problem stand clear before our eyes.

The Socialists and other working men, the Trudoviks and other peasant parties, followed Kerenski, and many of them even made him their mouth-piece, merely because they recognised him as one of the *Intelligentsia*, from whom a protest would come better than from one of themselves. Korniloff was followed by representatives of the regular army and various other institutions, because they recognised in him the essentially military spirit and because they thought that nothing, for the moment, could so effectually restore order as the old military method. Thus in the inmost mind of the two groups there were the two essential ideas which had always clashed one with another from the very beginning of the Russian State: extreme individualism and extreme collectivism. Extreme individualism is at once the vice and the virtue of the *Intelligentsia*.

As to the meaning of this term, it is almost unnecessary to explain it further, in view of the great number of books on the subject which have appeared in this country during the war. Practically all modern Russian literature, art, science and music is the product of the mind of this class. Men and women of the aristocracy and men and women of the peasant class belong to it only when they cease essentially to belong to their own class and become merged in the *Intelligentsia*. The term *bourgeoisie* has now been applied to them by Extreme Socialists—the name by which formerly only the aristocracy and bureaucracy were known. But this is an abuse of the term which will rectify itself fairly soon.

The *Intelligentsia* did not make the conquest of the territories which form modern Russia, nor do they directly rule the country, but, as is now well known, they are the makers of what is called Russian culture, and they have a power of assimilation unknown in other classes in Russia. Nowhere else do the representatives of various Eastern and Western nationalities, including Jews and Caucasians, mix so successfully, hence they are nowhere less Slavonic or more "modern Russian." So far they cannot be accused of having been pan-Russian, as were most of the members of the old regime, nor have they run after Great Russia supremacy, an idea still cherished by many among the military party.

But however peculiar to Russia the class of the *Intelligentsia* may be, the meaning of the term is better understood in this country than is the real meaning of the term Cossack. And, indeed, without reference to history, and an analysis of the existing groups of Cossacks, it is difficult to realise that a person so called may be a Tungus of pure blood or a Buriat

of Transbaikalia, or a Ukrainian patriot, or simply a Russian peasant born and bred to a military life.

Who are the Cossacks really? To what race and nation do they belong? What are the distinctions between the Cossacks and the soldiers of the regular army, or the ordinary Russian citizens? Was it merely an accident that Korniloff's venture was supported by the bulk of the Cossacks? Why were the Don Cossacks heard of in this connection more than any one of the other eleven divisions of the Cossacks of Russia?

To answer all these questions it is necessary to bear in mind that the Cossacks at three different periods in their history stood for three different principles. These three stages correspond to the following periods of time:

- (1) The end of the fifteenth, the whole of the sixteenth, and a great part of the seventeenth centuries;
- (2) The eighteenth and the first thirty years of the nineteenth centuries;
- (3) The present day.

The name Cossack is undoubtedly of Turko-Tartar origin, and is strongly reminiscent of the almost identical word *Kaizak-Kirghis*, the name of the powerful tribe of Russian Central Asia. Freely translated, this term is usually rendered by "free man," "man free as the steppe bird," etc., the idea of personal freedom lying at the foundation of the original Cossack community. It is often supposed that the original *Kaizak* tribe was a conglomeration of rebels and refugees from various Turkish tribes whose strict organisation was resented by some of their members. The origin of the European Cossacks is accounted for in a similar manner. The story that they played the rôle of Eastern Crusaders who united to defend the Christian countries of Muscovy, Lithuania, Poland, and Roumania against the Tartar hordes, is one of those beautiful legends which are unsupported by history. As a matter of fact, the very reason for the formation of their community was the wish for a rupture with the countries from which they came, that is from Great Russia, Poland, probably Roumania and others.

These rebels may have had various reasons for their discontent. The introduction of a more rigorous serfdom is usually assigned as one of these causes, but the new economic condition of the modernised States was probably a more important factor. It would seem that the whole of the first Cossack movement was a protest against the complex State organisation and the industrial development that came to the East from the West. And indeed, we find that the Cossack national community returned to more or less nomadic conditions, with hunting, cattle-breeding and trading as its sole occupations. The Cossacks were for a long time strongly opposed to agriculture. It was not till later that their offensive and defensive warfare with the Turks forced them to adopt a military regime. In any case, it appears to be true of the forbears of the Cossacks that class distinctions did not exist, and that they felt themselves to be nationally independent of their original homes. South-eastern Europe between the Dnieper, the Don, and the Lower Volga, depopulated and devastated by the Tartar invaders, provided them with a natural and favourable retreat.

First Cossack Movement

It is difficult to form an accurate idea as to their exact racial composition, but since the Cossacks settled in Little Russian territory, and since the natives of this territory shared the ill-feelings of the Cossacks towards the States of Moscow and Poland-Lithuania, it is fairly certain that admixture with the Little Russian strengthened the national feeling of the Cossacks. Little Russian blood and the Little Russian language would therefore predominate, while fusion with the Asiatics must have been very slight, though in dress and mode of warfare the Cossacks imitated their Turkish foe.

The oldest and most military divisions of the Cossacks were the Western Ukrainians, Zaporozhians or Szech, who lived along the River Dnieper, and the old Don Cossack community settled on the River Don. The Don community, in contradistinction to the military organisation of the Ukrainians, has had the family group organisation, but both were very democratic. At the same time they were very obedient to their chiefs, and the concomitants of progress, such as agriculture, modern weapons and modern warfare, have found access to them very slowly.

All the other old Cossack societies were secessions from these two main groups. The relations of the Ukrainian Cossacks with Poland and of the Don Cossacks with Moscow were very strained, yet these States by their influence, more or less diplomatically exercised, did introduce some changes into Cossack societies during the seventeenth century. Among these changes the most obvious was the introduction of class distinctions. The classes were: *starshiny*, elders; *domovityie*,

old families of rich Cossacks; and *holyba*, poor people. And they were in constant strife one with another at the time when the clash between the Cossacks and their neighbouring States brought about the long wars and the loss of Cossack independence. The attempt of the Polish King Batory, and others, to make of the Ukrainian Cossacks a kind of border militia for the Polish lands, thus assimilating them to the Polish State, came to nothing, and led to the Cossack risings under Nalivaiko, Kosinski and Chmielnicki.

United with the Tartars and with Moscow, the Cossacks proved unconquerable, as far as the Poles were concerned, yet the wars left the Ukrainian Cossacks so weak that it was possible for Russia later on to put an end to their free national existence. The Don, and the closely connected Yaik Cossack communities gave at all times a refuge to the rebellious refugees from Moscow, just as the Ukraine was the abode of rebellious Poles. The revolts known in the history of Russia as the rising of Razin in 1667, the emigration of Raskolniki in 1667, and finally the Pugachoff rising in 1773, had all the support of the Cossacks. The end of the seventeenth century and the first years of the eighteenth century saw the close of the Cossack national existence.

Ideal of Independence

Through partitions, deportations, renaming, and change of internal government, the Russian Government, while leaving some of the old administrative forms, tried to substitute Russian imperialistic aims for the Cossack ideal of national independence. The people were divided into units now called *voiska* (brigades, regiments). Meanwhile, while the old Cossack communities were reorganised, new Cossack *voiska* were started on the reformed method, the latter not having any of the traditions of the old Cossacks. The new and the old Cossacks were then mixed, so that together they might form merely a military caste, distinct from the regular army, richly endowed with lands and privileges, and distinguished from other citizens by their special internal organisation, and their dependence on the authority of the Ministry of War alone. The principle of compulsory military service, introduced into Russia in 1874, was most strictly observed by these Cossacks, whose whole training made them a formidable mechanism, not only in wars abroad, but also as supporters of Tsardom. Communities (or, strictly speaking, regiments), belong to all the Cossacks of Asiatic Russia, namely, the Siberian, Transbaikal, Semirechian, Amurian, and Ussuriisk Cossacks. It was specially in the gradual conquest and subjection of Asiatic Russia that the qualities of the Cossack regiments proved most valuable. So much for the eighteenth century in the life of the Cossacks.

The third epoch of Cossack history is covered by the nineteenth century and the beginning of the twentieth, to be exact until the present Revolution. The opening of the year 1910 finds a Cossack population of some eleven millions of both sexes, in the eleven Cossack territories, where all adult males are obliged to perform military service for eighteen years. The largest groups are the Don and the Kuban *voiska*. As the Cossacks form a community within a community, they have less contact with other parts of the population than a regular army would have. It is true that within a Cossack *stanitsa*, which is composed of *khutory*, or villages, there may be some non-Cossack inhabitants, but only with a special permit from the authorities of the *stanitsa*. The distinction between gentlemen (officers) and ordinary men (privates), is observed in all Cossack *stanitsy*. Meanwhile, although the amount of land in possession of the Cossacks is something like 30 *dessiatine* (about 81 acres) per head in European Russia, and between 30 and 50 *dessiatine* (81 to 135 acres) in Asiatic Russia, only a small part of it is under cultivation. The military duties, and the preference shown for trade and similar occupations, are no doubt sufficient to explain why only 9 per cent. of Cossack land in Asiatic Russia was under cultivation in 1910.

The racial composition of the present Cossacks can be only roughly defined: there is probably as much Asiatic blood in them as there is Caucasian, Jewish, and West European blood in the class of *Intelligentzia*. The Trans-Baikal Cossacks are largely composed of Tungus and Buriat, the Don Cossacks of Kilmucks, the Orenburg and Ural Cossacks of Turks, Mordvines, etc. The most purely Slavonic, however, are still the Don Cossacks. The Upper Don Cossacks, who are fair and heavily built, speak Great Russian, while the Lower Don Cossacks, who are dark and slight, speak Little Russian. As for religion, the greater part of them profess Russian Orthodoxy, but the Raskolniki, Yedinoviertsy, and other Russian sects find many adherents among them, as also do Mohammedanism (over half a million) and Shamanism.

Thus apparently uniform and consolidated were the territories whose male population formed an army within the Russian Army at the beginning of the present war. We heard

much about their war-like attitude, about their women joining the army alongside of the men, and as the war progressed the Cossack rose to the position of chief hero of the Russian Army. It was perhaps not realised that the Government's masterful reorganisation in the eighteenth century did not really sweep away all the previous history of the Cossacks, and that the members of the Don Cossack community, broken up in 1733, and transported far away, one part to the basin of the Volga, the other to form the Astrakhan Cossack *voiska*, have carried to these new lands some of their old national feelings, while those remnants in their own territory of the River Don, cultivated these feelings with still greater fervour.

Again the Ukrainian Cossacks were still more broken up; in 1787 one part was given the name of "Black Sea Cossacks," and was transported along the river Kuban, while another part was taken to Bielgorod and called *Slobodskie* Cossacks. Yet they, too, have managed to cultivate and spread their feeling of national separation among the Little Russians. The recent manifestation of this separation took the Russian and Polish politicians by surprise, though it was apparent long before to the Prussian and Austrian diplomats. Since the Provisional Government, bowing to military necessity, granted autonomy to the Ukrainians, is it astonishing to find an echo of these events among the Don Cossacks? (Here we must assume for a moment the truth of the report of the rising of the Don Cossacks and their Hetman Kaledin, received here early in the history of the Kerenski-Korniloff conflict.) We need not attribute to General Korniloff any special rôle in the movement among these Cossacks, whom we may call Cossacks "with a history" [to distinguish them from the modern Cossack regiments], but nevertheless he is a symbol of them, just as Kerenski is a symbol of the *Intelligentzia*.

We see then that with regard to the Cossack part of Russia, the artificial intermingling of people "with history" and people "without history," did not result in obtaining the present Cossack *voiska*. Much of the effort of the old regime was indeed directed towards obtaining such a result; despotic rule, military organisation and special privileges and endowment being the method applied. And even in this case the Ukrainian and Don Cossack have not ceased to remember their ancient past.

If we consider, however, that the other classes of Russia, for example, the peasants and the *Intelligentzia*, have a different social and cultural composition and an entirely different history; we do not need to be very profound psychologists to see that the methods and principles which the modern Cossacks inherited from the old regime could never have been applied successfully to bring about the unification of the majority of the Russian people, in spite of the present great historical crisis.

A remarkable letter appeared on October 1st in the *Rheinisch-Westfälische Zeitung*, the organ of Krupps, signed "A Hamburg Merchant." Herr Ballin might well have been the writer. The following are extracts:

The outcome of the Scheidemann-Erzberger recipe for peace may be summed up in the words "Renunciation of victory." What this would mean for our economic life is hardly understood. It means neither more nor less than that we are prepared practically to abandon the economic fight with our enemies, or, more properly speaking, with England, and to resign ourselves to England's remaining in possession of the immense advantages which she has gained throughout the world. We cannot close our eyes to the fact that England has, on the whole, realised her war aims, and our brilliant military position should not blind us to the fact that our economic world-position is getting worse. Before the war our position as a world-power was based on our economic activity in all parts of the world, our world-commerce, our colonies, and our shipping. England's war aim was the destruction of our world-position, and in this she has succeeded as none would have thought possible. Our shipping and world-commerce are ruined, and it will need years of industrious toil to build up our old position again.

During the last three years England has been able to maintain the success of her early attacks on our shipping and colonies, to saddle us continually with fresh enemies, to set herself up everywhere in our place and to rob us of the foundation for rebuilding our foreign trade by the liquidation of thousands of German firms abroad. The cruellest blow was the adhesion of China and a large part of South America to the Entente. There is no possibility of our overseas trade taking up its former activity after the conclusion of peace nor of entering into the old relations. Practically no foundations for the latter exist any longer, while the enemy has taken our place in some cases in such a way that he cannot be removed from it. The German merchant who goes out into the world after peace will find everywhere ruins and a spirit of hostility.

Only England's complete defeat can force her to give up her plans and give our foreign trade free access to all parts of the world, including her colonies and spheres of influence. Only then will the other Allies and neutrals allow German traders of all sorts equal rights in their countries. We must hold out till our incomparable U-boats have beaten England to her knees.

The Great Fire at Salonika

By H. Collinson Owen (Editor of *The Balkan News*).

FOR all those who have had to make Salonika and its region their home for a considerable period during the war, time and things will now always be marked by one great division—before the Great Fire and after. It has cut clean across our lives, and in many ways upset them considerably. It is, at the time of writing, an impossible thing to order a cup of tea in Salonika. There is not a single hotel or café.

Conflagrations which lick up a square mile of a city within a very few hours, are after all not everyday occurrences, and it is a curious feeling to walk through what were once well-known streets and to find on every hand only a crumbled pile of rubbish, with here and there a heap still smouldering a fortnight or more after the outbreak. It is depressing to stumble along a street of fallen bricks and look at the ragged outline of what was once one's own flat at the top of (for Salonika) a noble building. It is melancholy to stumble a little further, mount a crumbling staircase and gaze into the unsightly ruins of what was once one's own club, and reflect that in that corner stood a table where for hundreds of nights all sorts of parties gathered over dinner and told stories of the Great War as they had seen it in almost every quarter of the world. And by the time the ruins of the Post Office, one's own particular Bank (fortunately solvent in spite of the disaster) and one's favourite café have been inspected—well, it is pardonable to feel that the bottom has been knocked out of existence, and that Salonika before the fire, with all its defects, was a paradise compared with Salonika after the fire.

It was an extraordinary scene while it lasted. San Francisco had its fire after the earthquake, and so did Valparaiso, but I doubt if anybody living has seen a more striking blaze than did we who were present at the destruction of old Salonika. This ancient battered city has in its soul a sort of itch for catastrophe. It is never happy unless it is throwing off another chapter of history. Plagues, massacres, attacks by barbarians and fires, with now and again an earthquake, have been its portion. The Young Turks began their revolution here (Talaat Pasha, by the way, was a Post Office clerk in Salonika).

Only five years ago there was a pitched battle between the Bulgarians and the Greeks in the centre of the town, and the bullet-pitted minaret of St. Sophia, which was the centre of that particular disturbance, now looks down on an area of wholesale destruction. A few days later King George of Greece was assassinated as he walked along the main street of his new city. Salonika becomes one of the storm-centres of the Great War, and the armies of all the Allies send their divisions here. And now we have our fire. If there ever was a city marked down for an unquiet life it is Salonika. It is not worth while wondering what will happen next.

All the same for a few days after the fiercest of the blaze had died down, an unwonted peace brooded over the place. Normally, the most damnably noisy of cities—with its rattling springless carts on cobbled streets, its scolding donkey boys, the rasp and screech of iron shop-fronts being pulled up and down (the most dreadful noise on earth this), and countless other nerve-racking sounds—it became a town of uncanny calm and quiet, where the footfall of the passer-by could be heard. To this succeeded a period when loud explosions startled us a dozen times a day, and half-bricks or whole ones came rattling over from the places where the engineers were blowing down dangerous shells of gutted buildings—precarious structures which, with the natural perversity of things, refused to topple down save after repeated heavy charges, although previously they seemed ready to collapse at the slightest vibration. Just when one had accepted the idea of being one of the few living things in the stricken city, the soul of Salonika began to stir amid its dust and ashes.

In a week the trams were running again along the calcined front; the graceful *caïques*, which beat a hurried retreat from the harbour wall on the night of the fire came flocking back with all sorts of food (including luscious melons) from the islands; little open-air markets sprang up; here and there shops discovered miraculously intact amid the ruins, prized open their warped iron shutters and began business again. The one cinema left standing announced a forthcoming performance for the benefit of the *sinistres*, and in short, Salonika made some sort of effort to show that in spite of disaster, it was not too downhearted.

For my own part, I have long since ceased to feel it strange to look out of one of the miraculously saved buildings on an acre or so of rubble with rows of skeleton windows, and melted,

twisted girders hanging down in festoons like lianas in a tropical forest. Below coughs and spits the exhaust of a petrol engine installed by the British Army, so that it may have at least a one-page daily journal in spite of the stocks of paper that went to swell the great bonfire. It was not easy at first producing even this newspaper, but it is well to have plenty to do when you are working in a sort of graveyard where the persistent dust comes creeping through the windows all day long, and there is no water either for washing or drinking. Doubtless this business of being constantly occupied has prevented one from realising to the full extent how completely the fire has changed one's existence; and it has also dimmed to some extent the memory of that extraordinary day when the fire that started high up in the Jewish quarter, swept down stage by stage until it reached the water's edge and pushed a large proportion of the population into the sea—or, at any rate, on to the lighters of the British Navy.

Strange Eviction Scenes

Between 5 and 7 in the afternoon I was watching one of the strangest eviction scenes of all time, as street after street of crowded Jewish houses, tenements, courts and hovels were licked up and patriarchal Jews by the hundred with fezzes and white beards and a local sort of gaberdine costume known as the *intari*, rushed about actively in spite of the skirts that clung round their slippered feet. It was an amazing and a sad scene—wailing families huddled together, the crash of falling houses as the flames tore along, swept by the strong hot wind known as the *vardar*; a slow moving mass of pack-donkeys, loaded native carts, *hamals* carrying enormous burdens on their bent backs; Greek boy scouts (who seemed to be doing excellent work), soldiers of all nations; ancient wooden fire engines that creaked pathetically as they spat out ineffectual trickles of water; family groups carrying beds (hundreds and hundreds of flock and feather beds), wardrobes, large mirrors, sewing machines (every family clung to its sewing machine) and a general indescribable collection of ponderous rubbish.

The evacuation of each street came in a panic rush as its inhabitants realised that their homes also were doomed. All the way down the hill the narrow streets were littered with these pathetic objects, broken or cast aside in the gathering rush. By 9 p.m. the more modern and commercial quarter, with its many well-built shops, warehouses and hotels, was attacked. Here merchandise of all descriptions took the place of the household gods of the houses up the hill, but it was the same story—very little that was dumped into the street could be carted away. Merchants who had scoffed at the idea of the fire invading their quarter now dashed about in panic, imploring transport that was not to be had. So, as the short hours passed, practically the whole of the central portion of the city was ablaze—the sea a red glare as it reflected the furnace of the mile-long front; ships pushing hurriedly away from the sea wall, with one *caïque* blazing; and thousands of refugees crowded on the port—black pigmies against a titanic crimson background.

At some moment late in the evening a great change occurred. The British Army, which up to then had belonged strictly to the British Army, suddenly, in a twinkling, became everyone's property, and from apparently nowhere hundreds of great lorries appeared. Soon they were packed with families and what was left to them of furniture, and went off, came back again, and repeated the work a dozen times. Tommy was at his best, and in spite of the smoke and glare and noise and the spectacle—apparently—of the universe burning, there was order and method once the problem of getting the people away was tackled. In the midst of it all I remember buying a 2d. slice of melon at the corner of the English Quay and thinking it was one of the best things I had ever tasted. The melon vendor, as he sliced up his fruit, seemed to regard catastrophes as excellent things.

By four in the morning the spectacle of a big hotel being destroyed in a quarter of an hour or so was commonplace. The sight later of calcined Salonika, once the first rush of the fire was spent, seemed quite natural after the blaze we had seen. By now we who still work in the middle of it regard a ruined city as more or less a normal thing. The Greek Press has said some extremely flattering, even fulsome things about the work of the British soldiers during and after the fire.

Now has come a contest of wills as to the future rebuilding of Salonika. And when modern Greek meets ancient and unchanging Israelite, you may look out for the tug-of-war.

Life and Letters

Mrs. Meynell

By J. C. Squire

MRS. MEYNELL'S *A Father of Women, and other Poems* (Burns and Oates, 2s. net), is a small paper-covered book. It contains sixteen poems, ten of which appeared nearly two years ago in a privately issued volume. Several of these poems are, not unexpectedly, topical. And he who knows Mrs. Meynell's work will know that no topical poem of hers, even if unsuccessful (which these are not), could fail to afford a plain demonstration of one of her greatest qualities, namely, her habit of thinking for herself and avoiding (to use her own phrase) "the facile literary opportunity." She writes, for example, on the Shakespeare Tercentenary. So did ten thousand other poets. They boxed the compass of the obvious, as to the manner born—which, indeed, most of them were. They told Shakespeare, *ad nauseam*, that he was the Swan of Avon (a term which should by now be reserved as a designation for public-houses) and they told us, with monotonous iteration, that he was Britain's greatest glory; that he was the common property of the English-speaking peoples; and that, take him for all in all, we should not look upon his like again. Only two writers—Mr. Thomas Hardy and Mrs. Meynell—broke silence merely because they had something to say. These were thinking about Shakespeare before they wrote. And Mrs. Meynell's reflections on the fact that she had lived through the tercentenaries of Shakespeare's birth and death, and might, with such a length of days, have seen him in his cradle and closed the earth on him, the image of that magnificence and fullness thus enclosed as it were within her own comparative waste (as she sees it), are very characteristic of her complete inability to write like a hack.

* * * * *

One may take another example. She has a poem on the Early Dead in Battle. But it is neither a lamentation over the young who have died before their prime, nor a thanksgiving that they died well. Her mind travels its own road, and she discovers to us, surprisingly but convincingly, that he who dies in early manhood has actually the *longest* part of life behind him, that time is never so long, and joy never so deep as in childhood, and that as we grow older our childhood seems a tract of almost immeasurable extent, but the later years much more fleeting and much less full:

What have you then foregone?
A history? This you had. Or memories?
These, too, you had of your far distant dawn
No further dawn seems his,

The old man who shares with you,
But has no more, no more. Time's mystery
Did once for him the most that it can do;
He has had infancy.

And all his dreams, and all
His love for mighty Nature, sweet and few,
Are but the dwindling past he can recall
Of what his childhood knew.

He counts not any more
His brief, his present years. But Oh, he knows
How far apart the summers were of yore,
How far apart the snows.

Therefore be satisfied
Long life is in your treasury ere you fall;
Yes, and first love, like Dante's. O, a bride
For ever mystical!

Irrevocable good—
You dead, and now about, so young, to die,
Your childhood was, there Space, there Multitude,
There dwelt Antiquity.

* * * * *

There are several beautiful poems in the book, but it is too small to be more than a supplement to the *Collected Poems* and the *Collected Essays*, two volumes which contain fewer imperfectly executed sentences and fewer misty thoughts than, perhaps, any of our time. She does not in the new volume publish anything equal to *Christ in the Universe* or *A Girl's Letter to her own Old Age*, but she leaves us in no doubt as to her continued capacity to equal them. Her heart is as fresh and responsive as ever it was, and her craftsmanship remains most scrupulously careful. Concentration on the

rightness of every sentence and every word is a risky thing to some writers: and the tiresome talk of the decadents has resulted in its being regarded as something approaching a sin. But a thinker so conscientious as Mrs. Meynell, one who never writes save when deep springs of experience are flowing, is never in danger of polishing nothings or of seeking painfully to string together a series of mere agreeable noises or curiosity-shop words. All of her work is of one piece, and at its finest—in the poems mentioned and in such essays as *The Spirit of Place and Composure*—it is of its kind perfect.

* * * * *

The poet's attitude, her "outlook on life," is unchanged and could not change: and one may attempt to approach a definition. There is a sentence in Bacon's *Advancement of Learning* which runs thus:

So certainly, if a man meditate upon the universal frame of nature, the earth with men upon it, the divineness of souls excepted, will not seem much other than an ant-hill, where some ants carry corn, and some carry their young, and some go empty, and all to and fro on a little heap of dust.

This detached "meditation" is not uncommon. Swift cultivated it in order to make the ants angry: Anatole France, the sentimental cynic, does so in order to procure a cheap pathos and a cheap amusement for them and himself. "The divineness of souls excepted" is a large reservation, and, with Mrs. Meynell, so large that it almost might cancel the rest. Almost, but not altogether. She too, after her manner, retires into the immensities of Time and Space and contemplates pain and pleasure, birth and death, as small and transient things: not for perverse amusement or the consciousness of superiority, but for a refuge and a consolation. She has at once an extraordinarily sensitive heart and a perfectly balanced brain: a capacity for an intolerable excess of feeling but a permanent check in the steadiness and sagacity of her thought. She reminds one of her own exquisite casual image, "the aspen poplar had been in captive flight all day": the delicate fluttering tree, stirred by every little wind, reflecting every alternation of sunshine and cloud, governed sometimes for long periods by one mood and one direction, but anchored firmly to its immovable roots. She scarcely ever writes even a short lyric which is spontaneously emotional throughout: her first pleasure in the smallest thing, in a girl's eyes, in a thrush's song, in a weed upon a ruined arch, in the wind over the grass, leads always to "meditation": and pain leads there even more surely than delight. Sometimes expressed, more often implicit, is the steady outlook upon all the worlds which makes so permanent an impression upon the reader of her beautiful *Collected Essays*, and of which a typical expression is the concluding paragraph of *The Rhythm of Life*:

For man—except those elect already named—is hardly aware of periodicity. The individual man either never learns it fully, or learns it late. And he learns it so after, because it is a matter of cumulative experience upon which cumulative experience is long lacking. It is in the after-part of each life that the law is learnt so definitely as to do away with the hope or fear of continuance. That young sorrow comes so near to despair is a result of this young ignorance. So is the early hope of great achievement. Life seems so long, and its capacity so great to one who knows nothing of all the intervals it needs must hold—the intervals between aspirations, between actions, pauses as inevitable as the pauses of sleep. And life looks impossible to the young unfortunate, unaware of the inevitable and unfailing refreshment. It would be for their peace to learn that there is a tide in the affairs of men, in a sense more subtle—if it is not too audacious to add a meaning to Shakspeare—than the phrase was meant to contain: Their joy is flying away from them on its way home; their life will wax and wane; and if they would be wise, they must wake and rest in its phases, knowing that they are ruled by the law that commands all things—a sun's revolutions and the rhythmic pangs of maternity.

From a pagan philosopher this would be roughly equivalent to "Hope thou not much and fear thou not at all," which, as pagan mottoes go, is as good as any. "The divineness of souls excepted" makes a difference: but Mrs. Meynell, although she has written some of the finest modern devotional poetry, seldom brings in faith to queer the pitch of reason. She is, if one may seize "the facile literary opportunity," a Christian Stoic.

The Sower of Tares

By Centirion

"EIGHT points starboard!" called the Lieutenant from the bridge.
"Eight points starboard, sir" chanted the skipper in antiphon from the wheelhouse as he glanced at the compass overhead.

As our drifter changed her course, making a right turn, a pennant fluttered up the flag-staff at a signalling station on our port bow, paused interrogatively at the truck, descended, and then ran up to the truck again. It was the "Pass friend, all's well" of those that go down to the sea in ships. The exchange of salutations was repeated at the guard-ship as we cleared the harbour-mouth and stood out to sea. The sun glinted on the brass-work of the six-pounder in our bows, the sea was smooth, and the telegraph was set at full-speed ahead. Our mizzen-sail was furled and our masts bare, save for the spidery web of our "wireless"; nothing was to be heard except the faint throb of the triple expansion reciprocating engines in the bowels of the ship. Our craft had an ingenuous air, and but for one or two unobtrusive things might have been merely putting to sea for a quiet trawl among the herrings as she did in the old days before my Lords of the Admiralty requisitioned her and made her stout, smooth-faced skipper with the puckered eyes a warrant officer in the R.N.V.R. The flaws in the illusion were the presence of the six-pounder forward, certain extremely lethal cases under the bulwarks aft, a wireless operator secreted in his dark room down below, and the fact that we all wore life-belts. And in the wheel-house was a small armoury of rifles.

Still, it seemed extremely like a pleasure trip, and I settled myself down on the bridge behind the "dodger" with a leisurely conviction that I had chosen the quietest way I could of spending a few days leave. The crew moved softly about the deck stowing away gear; one of them peeled potatoes into a bucket outside the galley, and my friend the Lieutenant went below to the chart-house to read some cryptic naval messages and glance at the Admiralty "monthly orders." The Admiralty can give points to the War Office in the matter of periodical literature; you would never look for a plot in an Army Council Instruction, but in the Admiralty Orders every order "tells a story." But if you ask a naval patrol man on shore-leave, he will answer you like the needy knife-grinder "Story? God bless you, sir, I've none to tell." The Admiralty does not love story-tellers. This is not a story.

"Something ahead on the port bow, sir," shouted the look-out man forward.

The Lieutenant, whose faculty of hearing, like his faculty of vision, seems to be abnormally developed, came rushing out of the chart-house, scaled the bridge ladder like a cat, and in two seconds was by my side. He pulled a pair of binoculars out of a pocket in the "dodger" and looked through them for a moment. Then he ran to the telegraph and put her at "slow." At the same moment one of the crew, without waiting for orders, handed him a rifle from the wheel-house. No one spoke a word.

About a quarter of a mile ahead, a point or two off our course, I saw a dark round object bobbing up and down like a cork.

The Lieutenant got a "bead" on it, and I watched him intently. The next moment he lowered his rifle and laughed.

"It's only a ship's tub," he said. "Like to have a shot at her?" he added as he pumped two cartridges at the vagabond. One shot fell just short, the other just over. I saw the skipper's eye on me as the Lieutenant handed me the rifle, and feeling the reputation of the junior service was at stake I did not welcome the invitation. But luck was with me.

"A bull's eye," said the Lieutenant approvingly. My reputation was saved.

"It might have been a floating mine," the Lieutenant explained. "One never knows."

"So that's why we're wearing these beastly cork-jackets" I said to myself. I began to understand the Admiralty instruction, that you must never stop to pick anything up. For, in these days, things are not what they seem, and a tub, a life-buoy, a sleeper, an upturned boat, all the ingenuous flotsam and jetsam of the sea may be—and often are—merely a trap for the unwary. The Admiralty does not encourage souvenir-hunting. We only collect two things—mines and submarines.

We were out on an uncharted sea. So long as we had kept in the channel swept by the mine-sweepers in the grey dawn our charts were useful, once outside it those charts were about as helpful to us as one of Taride's maps

would be to a Divisional staff at the Front. Trenches, saps, dumps, listening-posts, "strong points," have altered the geography of the Front; floating and anchored mines have confused the hydrography of the Channel. The soundings on our charts were more delusive than the roads and water-courses on a French ordnance-map of the Somme. But at the Front the R.E. can, and do, make new maps for old, whereas we had to grope in the dark making the best use we could of our senses. The earth is solid, stable and open to aerial reconnaissance and survey; the sea is forever shifting and inscrutable. We had our secret staff-map of the sea, and very useful it is for wireless work, but it tells us nothing of the tares sown in the deep, and the soundings on our charts reveal to us none of the shoal-water of the mine-fields. Once we leave the fair-way kept clear for the merchantmen, and make for our line of traffic patrols on point-duty, we are like a reconnoitring party that goes "over the top" at night. We are out on the No Man's Land of the sea.

We were leaving the fairway now. We had altered our course a few points to the south, steaming in "line ahead" formation, a motor-launch following us, then another drifter, each keeping a distance of about half a mile apart. If we sighted a periscope to port or starboard we could suddenly put the helm over and bear down on it. Steering thus in a bad light, our drifter had once rammed the mast-truck of a sunken ship in mistake for a periscope and scraped her bottom badly, for she never misses a sporting chance. But our distance was also a defence formation. One does not march in column of fours when the enemy batteries have got the range. And when you are cruising over No Man's Land of the sea you must proceed on the assumption that at any moment you will strike a mine, in which case it is just as well that Number One should go to the bottom on her own. We were Number One.

But the naval patrol takes these things as a matter of course. Down in the bowels of the ship in the crew's quarters, reached by a perpendicular iron-ladder opening at a hatchway about the size of a pin-cushion, two members of the crew slept like dormice in a blissful "fug." Next door, the wireless operator, with the receiver to his ear, was immured in his sound-proof box, calling spirits from over the vasty deep. Below the engine room hatch the engineer, with his eye on his pressure-gauges, was dreamily making apple-dumplings out of cotton waste. If we scraped a mine they would all be drowned like rats in a hole—a mine always gets you amid-ships. The Skipper would probably go through the roof of the wheel-house, and the Lieutenant beside me on the bridge would execute a series of graceful gambols in the air like a "flying pig" from a trench mortar. This had happened to one of the drifters in that patrol a week before; they picked up one man, who will never go to sea again, and the others are all "gone West."

"They were good men—some of the best," said the Lieutenant.

As I looked at the cloudless horizon and the smooth sea sparkling in the sun I reflected on the treachery of the illusion, and it occurred to me that of all the risks of active service, those endured by the "Auxiliaries" of the naval patrol were the most unpleasant. Personally, I prefer the trenches. But the Lieutenant would have none of it. He said—and obviously thought—that his was a "cushy" place in comparison. I had heard a submarine commander to the same effect. Also my pilot in a Maurice Farman. It's a curious fact that every arm of both services thinks the other arms take all the risks. Which is as it should be.

The Lieutenant was an imperturbably cheerful person. A perpetual smile dimpled the corners of his mouth and completed the illusion of precocious boyhood produced by his diminutive stature, his frank ingenuous countenance, laughing blue eyes, and kittenish agility. His face was tanned to the colour of newly-dressed leather, but when he removed his cap the tan was seen to terminate suddenly in a sharp horizontal line on his forehead, above which the infantile pink and white of his brow presented a contrast so startling as to suggest that he wore the false scalp of a low comedian. But the palms of his hands were as hard as a cobbler's, and his muscles like tempered steel. There were many deficiencies in his kit, and, seeing me glance at the toes of his feet which peeped out of his sea-boots, he gravely explained that as the water came in at the top, the holes at the toe were useful to let it out at the bottom! He was the only commissioned officer on board, and his repertoire was extensive—he was commander, gunnery lieutenant, signalling officer, and half a dozen other things besides, and he carried in his head all the secrets, which are many and complicated, of the Admiralty codes

and instructions. I suppose he sometimes slept (though I never once saw him asleep) for he showed me his sleeping cabin forward, which I shared, and it did not escape me that the stove chimney was red with the rust of seawater to the height of about five feet—which opened my eyes to the luxury of his existence in the winter gales. At one time, early in the war, he conducted a series of brilliant tactical operations against a number of Medical Boards who shared a belief, amounting to an infatuation, that a man who, as the result of an accident in childhood, could not march a mile without falling out and suffered excruciating agonies at regular intervals of about a week, was "unfit for general service." They know better now.

Our approach to our immediate objective was the occasion of a spirited display by the Lieutenant of his gifts as a trapeze artist. We had run up a hoist of signals as we neared the line of patrols, and the engines being put at half-speed, the Lieutenant took two signalling flags in his hands like a pair of Indian clubs and perched himself upon the rail of the bridge. He twined his calves with simian-like flexibility round the uprights, his feet suddenly became prehensile as he anchored them to the middle rail, and with his lower limbs thus moored, he proceeded to hurl his body about in space. His arms described an arc of three-quarters of a circle with dazzling rapidity as he executed a series of alphabetic jerks in the medium of semaphore varied by almost imperceptible commas and full-stops. Then he paused to take breath.

An ecstatic figure on the upper rail of the bridge of the other drifter answered with similar gesticulations, to which the Lieutenant feelingly articulated in reply.

The interlocutory proceedings of these knock-about comedians concluded with an inquiry from the patrol boat, which had been on point-duty in mid-channel for fourteen days, as to the success of a wedding ashore, at which the Lieutenant of our drifter had assisted as best man.

"A.I. THE BEST MAN LOOKED LOVELY," signalled the Lieutenant, and we descended to the chart-room for a mid-day dinner.

He apologised for the *menu*, which was simple enough. I discovered afterwards that he made it a point of honour to share the same rations as the crew. The table appointments were also exiguous, and there seemed a shortage of plates.

"They're 'gone West,' sir," said the orderly with a faint smile. "That depth-charge did them in."

I raised my eyebrows interrogatively. And the Lieutenant, by way of explanation told a tale. It cannot be told here, but there is a certain *U-boat* which will never make a "land-fall" in German waters again. The Admiralty, which is hard to convince, paid the "blood-money" over to the Lieutenant a few weeks ago and the patrol shared it out, according to their ratings, like a herring catch. And there was a "bump supper" at the Naval Base. But the auxiliaries hide their light under a bushel, and the lady visitors at a fashionable watering-place are still wondering querulously why the sea is so lustrously wet—they say their bathing-dresses won't dry and that they smell strangely of oil.

So one more of the Thugs of the sea had been put out of the way, and her crew lie fathoms deep in the Channel awaiting the day when the sea gives up its dead.

"Dirty devils, I call them, sir," said the Skipper quietly, smoking his pipe with his hands thrust into his pockets and a reef in his jumper as we did a dog-watch together. He was a large stalwart man, speaking the East Anglian dialect, in which an "a" frequently does duty for an "e" and a "w" for a "u." Apart from these phonetic peculiarities his speech was good King's English, and I noticed that he used none of that truculent pidgin-English which by a curious literary convention so many longshoremen of letters put into the mouth of those who go down to the sea in ships. Your novelist, dealing in words, is so apt to mistake strong language for strength of mind.

The Skipper paused and refilled his pipe, pursuing some obscure strain of thought. Then he found speech.

"Did you hear tell of the *Belgian Princee*, sir? Aye, everybody has. There's never a dog-watch kept in any ship afloat in which that story isn't told. I've heard as men tell it in every boarding-house in Limehouse and 'Frisco and Sydney and Shanghai. It's gone round the Horn, and it's gone east of Suez. Why, there's sailormen as doan't know enough to read their own discharge-note as have got that story by heart like a 'chantey.' They'll never forget it till the Day of Judgment. I'm thinking as sailor-men as are not yet born will be telling that tale round the galley-fire at night long after your an' my watch is up."

He paused and gazed out over a "lipper" sea. I noticed he had forgotten to light his pipe. "I knew a skipper as had once done the dirty at sea. No one knew the rights of it exactly, and the 'Old Man' never lost his 'ticket,' but the story I heard tell was that he'd been 'spoken' by a ship flying signals of distress, and instead of putting down his hellum to

stand by, he'd kept on his course and left her to sink with all hands. And from that day he never entered a 'pub' parlour but all the skippers 'ud get up and lave their glass untouched and walk out. If they saw him making down street on their port bow they'd port their hellum so as to give him a wide berth. Never a one as ever passed the time of day with him or said 'what 's yours?' And it grew so that not a sailor-man would sign on if he knew as he was to sail with that skipper; some of them 'ud desert at first port they made wi'out waiting to be paid off. They got the idea as he brought bad luck, like a Russian Finn. And if you once get a notion like that in a sailor-man's head, ye'll never get it out. I've heard tell of that skipper hauling up to 'speak' a ship, and when his hoist had told the name of his craft t'other ship wouldn't so much as dip her ens'n to wish him 'God speed.' And if ye're an outcast at sea God help ye, for the sea's a lonesome place. It so preyed on the mind of him that he began to see ships flying signals of distress a-beckoning of him, ships as wasn't there—till one night he put her straight on a reef and then went over her bows. . . . You see, sir, sailor-men have got their share of original sin, I'm no saying they haven't, but there's one sin no sailor dare commit, for it's the sin against the Holy Ghost—and that's leaving other sailor-men to perish. The sea's shifty enough and farrible enough and treacherous enough as 'tis without men being . . ." He did not finish the sentence. "Well sir, I'm hanging about tack and tack instead of trimming my yards for a straight run, but the course I'm steering is this: the outlawry of that skipper warn't nothing to the outlawry as awaits the German when he once more weighs anchor and puts to sea."

And he lit his pipe. It seemed to me that his hand shook slightly.

The sun was sinking slowly in the west, his light lingering on the headlands, in the east the sky was a deep blue flushed with rose-pink, but nearer the heart of the sun these delicate tints gave place to fleeces of ochre, and these in turn to flames of molten gold. The next moment the sun seemed to cease breathing upon the sky, all the colours swooned and went slowly out, and even the golden aureole changed to a dull vermilion. The rocks became silhouettes, the clouds turned black, and the shoals of rose-shadow on the surface of the sea sank out of sight and gave place to a purple bloom. As the sun disappeared below the horizon a lingering ray tinged the darkling clouds with silver surge.

With the last expiration of the sun the wine-dark sea changed to a leaden hue, and one by one stars twinkled overhead—the crescent of the *Corona Borealis* to port, the *Pleiades* to starboard, and over the truck of our foremast the constellation of the Great Bear. The air grew very cold. A great silence encompassed us, broken only by the lapping of the water against the ship's sides. Round about us was a waste of waters stretching away into impenetrable darkness. All the friendly lights that guide the homing ships in time of peace were put out. More than once before this our drifter, smothered in a fog with no warning light or siren to guide her, and unable to take a cross-bearing, had found herself casting the lead in thirty-five fathoms right under the lee of a towering cliff with only just time to put her engines full speed astern. Nothing lightened our darkness except a great beacon which, elusive as lightning, winked at intervals across the sea revealing for a second the dark silhouette of the motor launch as she drifted about a mile away. Our isolation was as complete as that of a listening-post. We were out in the No Man's Land of the Sea.

"The letter is ———" said the Lieutenant softly to one of the watch as he passed along the deck. It was our secret signal in the event of our bumping up against a destroyer seeking to speak with her adversary in the gate. If our watch forgot it our number would be up. We showed no lights, but hooded lamps, making faint patches of radiance on the deck, were stowed away under our bulwarks.

Our station was one of the favourite beats of the German submarines and we lay there waiting for the deadly sower of tares, waiting for her as for a thief in the night. From time to time pale shafts of light terminating in an arc of phosphorescent cloud crept across the sky searching for the secret menace of the air as we were searching for the lurking terror of the sea. Now and again wraith-like ships with all lights out stole across the field of our vision, and sometimes our ears caught the pulsation of the engines of a ship we could not see.

Time itself seemed to stand still, and how long we lay like that I could not tell. Mystery brooded over our watch and I found myself speaking to the Lieutenant in subdued whispers. Suddenly, one of the men, ascending through the hatchway that led down to the tomb of the wireless operator, passed up a piece of flimsy-paper to the Lieutenant. He took it into the unlighted chart-room, and as I fell over the table he struck a match and by its

flickering light I saw his face as he read the message—HOSTILE SUBMARINES IN SIGHT. COURSE NOT KNOWN. As he read these words aloud—and others—the match went out. He groped in the dark for a locker, detachable and weighted, and taking something therefrom he invited me to come below. Once down in our sleeping cabin he unrolled a mysterious map under the oil-lamp, and putting his finger on one of the squares he said, "They're there." Then we went on deck.

He took an electric signalling-lamp and holding it up over the bulwarks he flashed a message to the distant motor launch. A sequence of flashes answered it. And once more we resumed our vigil.

The night dragged on, the watch was relieved, the stars changed their stations as the earth rolled on through interstellar space. I sat in the bows gazing into the mysterious night and hearing nothing but the whispered soliloquy of the waters beneath me. The dark-grey silhouette of a transport crept by, deeply laden, for the sound of her propeller never reached me. Then a barque glided past, but not a murmur escaped her, not a sail thrashed, not a block creaked. They might have been the ghosts of the murdered ships that lay fathoms deep beneath us, deep in the sepulchral sea. From time to time dark objects floated by—a packing case, a hatch, an upturned boat, a derelict sleeper, the mute and plaintive witnesses to a sinister and implacable terror "more fell than hunger, anguish, or the sea." I gazed down at the waters in which the phosphorus glowed faintly like palmarigolds, wondering what tragic secrets their inscrutable depths concealed. There grew on my drowsy senses a feeling that the sea, as it heaved on its bed under the tidal moon, was talking in its sleep. Faint peals of sound seemed to animate

the watery depths as though the sea were a belfry in which the bell of every foundered ship was tolling the watches of the night. I heard a dull tapping on our stern—I went aft but could see nothing but the shadowy figure of one of the deck hands. Then a hollow gasp like a cork drawn from a bottle came from our port bow. The next moment a deep sepulchral cough echoed from amidships; I looked down through the skylight and saw one of the crew turning uneasily in his sleep. By some strange acoustic illusion his coughing seemed to be coming from the depths of the sea. Each illusion was dispelled only to be succeeded by another. A block creaked, the cordage chafed, a chain rattled. And there grew on me a masterful conviction that we were not alone. I lifted my eyes and they lighted suddenly upon a dark boat-shaped object gliding stealthily past in the current about two hundred yards away. The next moment the beacon flashed across the waters rending the veil of night and in one trenchant glimpse I saw that it was a ship's life-boat. Over the gunwale drooped the body of a man, the head downwards between the extended arms and the hands lapped by the hungry waters. Across the stern another head rested with the pallid face turned upwards and gleaming in the cold searching light. I heard a soft footfall behind me, and turning, saw the skipper gazing over my shoulder. The next moment the beacon went out.

* * * * *

One by one the stars paled, diminished, and disappeared; the surface of the waters turned from black to a leaden grey and, with the first flush of dawn, gleamed like mother-of-pearl. I looked around me. Far as the eye could reach I saw nothing but the salt, inhospitable, secret sea.

Air Squadrons

By Francis Stopford

THE aeroplane for some reason has not yet caught firm hold of popular imagination. It still possesses an eerie fascination, so much so that even where aeroplanes are of common occurrence, an effort of will is often necessary to prevent people from running out into the open to watch these mechanical dragon-flies droning across the sky. But the machine has not hitherto passed beyond this stage, it still occupies in the popular mind a place beside the bearded woman, the living skeleton or the two-headed calf of the country fair. Perhaps this is not unnatural, considering the comparatively few months that have elapsed since man conquered the empyrean with the spoils of earth—metal and wood, canvas and rock-oil.

How many realise the length of years that have elapsed since this victory over the void was first pondered? One has only to turn to the penultimate chapter of the Book of Proverbs to comprehend it. Whether it was really Solomon in his palace of cedar who wrote it, or a literary Alexandrine of the same acquisitive race but of a later date, signifies little. "Who hath ascended up into heaven, or descended?" he asks, and a few sentences lower down he confesses: "There be three things which are too wonderful for me, yea four which I know not." And the first of these three or four puzzles is "the way of an eagle in the air." Already this question was troubling the human mind. Whether Dædalus came before or after, who can say, but it would be easy to demonstrate that the aeroplane is to-day the most striking symbol of human persistence and perseverance, of man's unconquerable nature. The thought has germinated for centuries; the thing was born but yesterday. Though we do not perhaps comprehend it we of this generation have witnessed the greatest mechanical prodigy which this planet has yet produced.

To a few it would sound blasphemous, to the many ludicrous, was it to be said that on that first Christmas Eve, the multitude of the heavenly host that assembled above the shepherds in the field, saying, "Glory to God in the highest and on earth peace, goodwill toward men," or if you would have the newer version, "on earth peace to men of goodwill," was in truth a vision of aeroplanes. Yet pause and consider, and the idea is not preposterous. The first condition of peace on earth has hitherto been the determination of certain superficial excrescences or waterdeeps—i.e., mountains, rivers or seas—between the various jealous congeries of mankind. These natural divisions of the earth, as we have hitherto called them, have been abolished by the navigation of the air. Henceforth humanity is one through circumambient ether, and seeing that man is as impotent to build partitions in the sky as to bind the sweet influences of the Pleiades, men of goodwill can never maintain

peace on earth unless their mechanical contrivances proclaim the glory of God in the highest.

The aeroplane is of the twentieth century—not twenty years old. The principle it embodies is as fixed and certain as the principle which ages ago enabled man to overcome the limitations of rivers and seas or which in much more modern times permitted him, through the power of controlled steam, to eliminate to a very large extent the delays and tedious processes of locomotion. Contrast Drake's *Golden Hind* or Humphrey Gilbert's *Squirrel* with Sir David Beatty's flagship or even with a new submarine. If that be too big a strain on the imagination stand in Darlington railway station, and as the Scotch express steams through, compare its engine with "Puffing Billy," silent on his triumphal platform at your elbow. It is obvious that the development of flying machines is in the future a logical sequence, a matter of mathematical progression. We are only at their very infancy. If already it is possible for warring nations to regard these machines, when employed for purposes of destruction, as weapons of victory, think what their powers must be fifty years or a century or three centuries hence. In further support of this point of view range the artillery of the present war against the batteries fired in Napoleon's battles. There is no reason to assume that the difference between fighting planes of this year of grace and of a hundred years hence will be less.

So far from there being any cessation in the advance of mechanical weapons of war, everything points to the exact opposite, if war is to continue. If war should cease on earth, it can only be by universal consent. It is conceivable that once we have utterly destroyed Prussian militarism and have stamped completely out this final outspurt of barbarism, as many regard it, a new state of international comity may be inaugurated which will never consent to war. But this attitude towards life, should it occur, will be attained mainly through the world's aerial navies. Air squadrons that carry in their vitals blind death equally for men, women and children, for armed camps and harmless cities, for marching battalions and quiet hamlets may obviously in course of time become the most powerful instruments of peace. If they do not, human progress must be stayed; man by self-preservation will be forced to be again a troglodyte and to return to his ancient caves in the rocks or his burrows among the tree-roots. Is such a reversion conceivable?

The building of air squadrons is perhaps the most beautiful work on which the sons and daughters of Tubal-Cain, "the instructor of every artificer in brass and iron" have ever been engaged. Now Tubal's first cousin was Jubal "the father of all such as handle the harp and the organ." And it needs no effort of imagination to assume that the children of those two descendants of Cain, the first murderer, work

together to-day in aircraft factories, when through the silent silver night-sky there comes the droning of the bombing machines, that music of hell's harps and the devil's organs of death. Whether it be possible to construct a silent aeroplane is a question unlikely to be solved in the immediate future. But as a matter of fact these marvellous mechanisms interest one far less through their present uses than for the capabilities that lie before them, when blood no longer flows.

The Uncharted Sky

Those who have watched squadrons of say ten or twenty planes manœuvring, must have been struck with the immensity of space. An aeroplane flying at a hundred miles an hour will at 10,000 feet appear almost stationary. It seems to drift slowly out of sight not by its own volition. The pitfalls and eddies that lie a few thousand feet above the ground are already familiar to airmen; when the height rises into five figures it is said that a Sargasso Sea is encountered—a region of perfect calm. But these altitudes in temperate climates are not without surprises, and when the upper currents of the Tropical Zone and possibly of the Frigid Zone are explored, other riddles will have to be read. It is doubtful whether the machine is yet built that rising from beside the Oucherlony Monument on the Calcutta *maidan* can soar northwards and descend upon the highest plateau of Mount Everest a few hours later, but it is absolutely certain, having advanced so far, it is only a question of time and experience before this flight is accomplished. Even now we know more about the uncharted sky than the Roman conquerors of this island did of the Gulf Stream. It is only by glancing backward that we can discern how much farther forward it is possible we may go. Already there are aeroplanes in the air—Dreadnoughts of the sky as they were called in *LAND & WATER* a few weeks ago—which are capable of carrying a dozen passengers from dawn to sunset of an autumn day without descending. Turn over the files of London newspapers seventy to eighty years old and peruse the fears and doubts concerning the new fashion of railroad travelling. It was thought a man would be stifled through lack of air if a train moved at fifty miles an hour. Such fears do not trouble to-day the most timid in regard to flight.

On a perfect autumn day—brilliant sun and windless blue sky—the writer stood on a wide stretch of meadowland, not far from London, with half a score of aeroplanes soaring at all heights above his head. Earlier in the day he had visited workshops in which men and women were busy and watched how out of crude lumps of metal and unbarked trunks of trees there grew into being a wonderful web of the most delicate frame-work, light yet so strong that it seemed the very poetry of handicraft. The wood lent itself to the saw, and the sawdust, sucked in by the fans, was turned into gas so that the air the work-folk breathed remained pure, and new driving power was created through what, in former times, had to be removed at considerable labour and cost. The workshops were large, lofty and cheerful, and it was easy for those employed in the toil to go out and see the miracle they had helped to create, singing through the upper air and tuning its voice here in England to take part in that hymn of battle that shall presently swell into a loud chorus of victory over there in France and Flanders. Throughout these workshops one was conscious of a spirit of comradeship which took away from the work the drag of drudgery. It is a joy of aircraft-building that the least imaginative can almost behold the creature forming itself into life, so clearly defined are the separate processes. Behind this let there be intelligent direction and that single purpose of achievement which is the secret of the best regimental spirit, in that it compels the individual to set above himself the honour and credit of regiment or workshop, and you have an almost ideal condition of industrial life.

It was now the afternoon. Standing in the grateful shade of an avenue that approached an old manor-house, with its Tudor walled garden behind one where peaches and pears were ripening in the open air, one looked over acres of grassland. In the distance new workshops were rising rapidly into existence; and the sun glistened on their roofs of glass and galvanised iron. Behind them was the spire of the parish church, and it was part of the picture. Gangs of men were hard at work in deep cuttings, for in another week the canal which Cardinal Wolsey had constructed to carry water to his pet project at Hampton Court, is to be turned underground by the Lord Mayor of London, so that these meadows will form one huge unbroken lawn, a perfect place for the uprising and landing of planes. "A thing of beauty is a joy for ever," and one never tires of watching a well-driven aeroplane running along the grass and lifting itself into the air; or when it returns, dropping gently down and lightly traversing the ground before it comes to rest. It is an exultant sight, for

it suggests that man has at last freed himself from the bonds of earth, though if he be not skilful he quickly finds earth remains an uncommonly solid fact.

One could not but wonder whether, were the great English Cardinal to re-visit these meadows he knew so well, he would be surprised. One doubts it. There is not so much altered in England as we are apt to imagine, and it has always been contrary to the English character to express emotion at mere mechanical contrivances, however new and noisy they may be. He would be much more likely to begin with criticism and to end by doubting the utility or beneficence of flying, unless concrete evidence could be produced. This Mr. James Whitehead (for his are the aircraft works and aerodrome here described) should not have any difficulty in doing; and his own typical British energy and force of character would doubtless appeal to Wolsey, who ever liked Englishmen who were able to get things done and done well.

The spirit of *nil admirari*, the slowness to accept a new invention or development is a common taunt against the British character in regard to the building of air squadrons. Whether we could have moved quicker is a question there is no intention of discussing here; at any rate the reproach has passed, and liberal-private support, one understands, is forthcoming for aircraft enterprises that have proved themselves worthy of it. But the refusal of the Briton to allow his emotions to be excited by new inventions or novel claims is a different matter. On the whole one leans to the belief that it is not so much England as Germany which has suffered from this national trait in so far as the building of flying machines is concerned. During the attacks on London by Gothas, nothing was more noticeable among British residents, men, women and children, than their refusal to be terrorised. The majority, there is reason to think, never really realised the machines that were endeavouring to break across the sky through our defences. They seemed to regard the bombardment as though a Thor, some godless Teuton god, was striving to hurl his thunderbolts on this city from Germany, and it was these bolts that our batteries were flinging back. They spoke of it as it might be a new sort of ball game—a mean kind of cricket or football on a big scale. Cheers were on tap at the least excuse, chaff was plentiful, so was bad language, but not a craven word.

True to Nature

By the gate of a certain London house there stands a chestnut tree overshadowing the pavement. On one of the bombardment nights with the guns still firing in the distance, the owner came out to reconnoitre in slippers. He became aware he was interrupting a love scene, for in the silence of the night a girl's voice rang out clearly, "Well, I can't exactly say I love you, but I do really like you." Gothas or no Gothas, English courting had to be done. That same night there was a sequel, a pathetic sequel, to this story. An old couple had for years made it a habit on fine nights to take a walk on open ground near their home before going to bed. It was glorious moonlight; and Germans or no Germans they refused to interrupt their practice. They strolled to their favourite bench, sat down, and a bomb falling just behind them, killed both instantly. It was sorrowful, yet one cannot help thinking that a cheer must have gone up as their souls passed together into the courts of Heaven—true Britons to their last breath.

It will be urged that both these couples were foolish. It may be so. It was certainly foolish of Englishmen in old days to drink bottled beer on the plains of Hindustan, and to pay duty calls in top-hat and frock-coat under a Bengal mid-day sun. It killed off many of them. These dangerous habits were due to the same trait—stubborn conservatism, refusal to accept new fangled ideas, determination to be true to oneself, though the skies fall. Call it foolishness if you will; it has been wasteful of human life, but it has won Britain an Empire. There is no more inexplicable fact in the growth of the human family, not even the persistent survival of the Bedouin tribe of Beni-Israel, than that a small hybrid people of the Northern Seas should have developed, alongside enormous energy and an insatiable craving for adventure, the same slow-moving spirit, the same blind devotion to tradition which animate the peoples of the Orient, with their more ancient civilisations.

The subject cannot be pursued here, space forbids it, but it is impossible to write about aeroplanes without entering a protest against intemperate indictments which have been uttered against us for not plunging more swiftly on this new weapon of war. Had England done this she would not have been true to her nature, and whatever punishment she may have received in consequence of this slowness to move, is light compared with that which might have happened had she proved false to herself. This is a point too often overlooked.

Autumn Days in Flanders

By an Officer

This vivid description of Flanders during the glorious weather which Western Europe enjoyed this autumn under the waxing harvest moon was written by an officer on active service before the weather broke and the present cold and rainy spell began. It forms an excellent commentary on Captain Handley-Reid's drawings of the British Firing Line, two of which are reproduced on page 20 of this issue.

AUTUMN has come to Flanders and it has come with a kindness, a well-disposed friendliness, not less agreeable to the Army than to those who direct our battles. It came in the night with a nip in the air, with a quick keenness and freshness in the small hours, with a sudden brightening of the stars which caused dwellers in tents to arise from their beds and to lay an extra coat over the sleeping-bags. Next day there was a clear blue atmosphere, a cool breeze morning and evening, mid-days an almost perfect stillness. The swallows had gone. They disappeared in the first days of September, not gregariously, a little mysteriously, without a noticeable grouping along roof-tops or on telegraph wires. They were just gone—gone from the land of dykes and ditches and an atmosphere curiously disturbed, gone to a world of perpetual sunshine, of exotic things, of azure skies.

There comes to Flanders about this time a certain golden dreaminess of atmosphere which is the nearest to beauty that the flat countries ever know. Fen-dwellers, those who live on flats and broads or beside far-stretching meres will know this—dwellers in the eastern English counties. No magnificence of flaming woods or of mountainous purple heath or of gorse-strewn commons, or of panoramic contrast. No bounteous spread of a late harvest or richness of the rolling plains. Instead, there comes a film of deepest blue and misty gold, a certain rich, lingering, yet fading quality of sunlight that blots out misery and horror, that discovers beauty in squalor and desolation, that conveys the fancy of some ultimate land wherein humanity shall rest at last.

And because the tracks and the roads are at their driest, and because discomforts are least, and because the worst horrors of the year are probably over, the soldiers, too, like this time the best. True, never far away, is the beckoning spectre of winter—the of the grim, grey, and mud-brown habit, whose visage is desolation, whose heart is colder than stone. But the private soldier, never a man who looks too far ahead, lives in and for the present which is his safeguard and salvation; for the man who allowed himself to dread would perish early; and if he lingers, poor fellow, in the self-deception that "the war will be over before Christmas," that "the Germans won't face another winter"—it is testimony to his magnificent incurable optimism, it is part of his curious simplicity and pathos.

Looking out of a window, one glimpses a scene that would gladden the hearts of those to whom war is a tragedy unrelieved, whose nearest and dearest out here are as the lost and the damned for ever wrestling in a kind of Purgatory. The October sunshine streams in through open windows, lighting up cheerfully this farmhouse room which might otherwise look a little dingy. A fading flowery wallpaper, a chest of drawers of dull polished mahogany, a great dark clothes cupboard, three beds with spotless sheets showing, two of them tented [with the queer white cribs to be found in all these farmhouses; a figure of the Virgin in an elaborate (and hideous) white cardboard shrine beneath a glass case; one or two faded oleographs of sacred subjects on the walls; low beams supporting a very low ceiling—this is the interior. It is exceptionally comfortable, exceptionally clean, but in other respects precisely representative of every other French or Belgian farmhouse.

Outside is the courtyard with farm buildings on three sides. Ducks and poultry make the place lively with their quacking and cackling; from the byre comes the lowing of cows, comes also the farmer who has been milking—a sour-looking man, but polite withal, and good-humoured like most of his race. The wife is there too, a rough kindly female, whose hands are never idle. They live hard, these people, to judge by appearances. Of a military aspect there

is nothing but the sentry tramping up and down his post. The billet-guard lounge outside the farm, which is their guard-room. A man, clad only in shirt and trousers, lies at full length dozing in the pleasant sunshine; another is asleep in the same garb and attitude, and I think I have never seen such an expression of perfect content as rests upon his face; others are playing football in the meadow opposite, their shouts and laughter float in on the sunbeams like those that came from playgrounds of a half-forgotten boyhood. Beyond is a wide, flat vista of little fields poplar-lined, of hedges rows studded with curiously-pollarded oak-trees, of small marshy streams whose outline is discovered by a line of crooked willows, of thatched and brilliant red-roofed farmhouses peering from poplar-groves, and here and there an orchard and here and there a church spire. It is a monotonous landscape, but a restful after the world of shell-holes and desolation.

Here is no war. Aeroplanes go droning overhead on their missions to and from the line. We have field days—a sort of Olympic game. By night you may see the anti-aircraft shrapnel bursting far away to the eastward. The other evening, many miles distant, a captive balloon could be seen slowly falling in flames like a sheet of burning paper. By night, too, criss-crossed and interlaced, countless searchlights throw white beams across a dim purple jewelled sky.

But as you move off the roads toward "the line," there comes a monotony far deeper, a wealth of activity far more same and unvarying than the landscape of Northern France. That landscape changes as soon as the frontier is crossed, the little grassy fields give place to a semi-suburban country, a succession of plots and lots, of cabbages, vetches, potatoes, hops, roots, clover, and close cultivation. The villages and towns are not beautiful—no rest for the eye anywhere. And from the paved tree-bordered main roads comes the turgid grinding brawl of the motor traffic, a worrying medley of sounds which has not ceased since August, 1914, which will not cease until the great armies fade at last into the grey Flanders mist.

Day and night, night and day, winter, spring, summer, and autumn, it goes on, this hoot and hurry of the traffic to remind lonely Londoners of well-remembered lighted streets in the cheerful early dusk.

And as you move onward with the tide of lorries, the waggons, and the long lines of moving traffic, you come to a yet deeper monotony, to a monotony yet more changeless, after the endless camps, the endless horse and mule-lines, the endless swarming troops and khaki, the empty husks of houses and skeleton villages, you come to the vast crater-field—to use an apt German expression—the old brown battlefields. Thitherward we all go, and autumn brings no change, for no change is possible—it is perpetual winter there. But stay! Is it winter when the bright October sunshine rises over Houthulst, lighting splendidly the promised land beyond this grim, stern-named valley of Braenbeck, and tired outposts shake the dew from their clothing, and German smoke rises from German fires beyond the stream, and night is past.

Captain Persius, the well-known Naval writer in the *Berliner Tageblatt*, expressed this view of submarines towards the end of last month: "In spite of all our enemies' boastful attempts to prove that the submarine menace is slight, and in spite of the enormous and increasing difficulties which beset our submarine crews, the belief of the German people remains unshaken and unshakable, and they know that in the end, when the requisite quantity of submarine material and men have gone into action, Great Britain's wish to continue the war will be so paralysed that there will be a reasonable prospect of peace. The reports of our Admiralty Staff, which reach us almost daily, cause us to gaze with constant admiration on those heroic souls, who are fighting in home and foreign waters for the weal of the Fatherland, sometimes on, and sometimes under the water, but always looking death in the face. We also remember with gratitude those who are producing these complicated instruments. Only by the combination of personal and material forces of the most specialised kind can we attain ultimate success by means of these most modern weapons, whose destructive capacity, so far as war and merchant shipping are concerned, is astonishing the world, and opening a way to entirely new methods in naval warfare."

Some Lighter Literature

IT is an old saying that it is pleasant to play the fool at times; and if one remembers aright, this homely truth was put on record by the same pen that wrote that it is a pleasant and comely act to die for one's country. These two Horatian tags are brought home to one by a book of frivolous drawings which Mr. John Lane has just published (*The New Eve*: drawings by Fish; written and designed by Fowl, 3s. 6d. net). To keep up the idea we may add the result is good red herring for it does draw the mind away from the sadness and perplexities of these times. Readers of the *Tatler* will be familiar with these light and airy sketches of officers and their best girls; there is a fund of laughter in them; and it is just the sort of volume a host and hostess likes to have lying about the house. It would almost make a dentist's anteroom cheerful.

* * * * *

The detailed biography of a Russian aristocrat given in *Michail* (Heinemann, 6s. net), affords a picture of Russian life before the revolution, and up to the first days of the war; not only does it present the extravagances of Russian society, but in portraying Michail with the minuteness characteristic of most Russian authors, it affords glimpses of the difference between the Russian character and the characters of western peoples. Michail's life is taken up at the point where he has become involved in an intrigue which, to satisfy his sense of honour, can only be ended by a marriage that is distasteful to him; the story ends with his death in the course of the war, and between these two points there is given a sight of the man and his motives and actions. The author—whose name, by the way, is withheld—has succeeded in presenting her hero in such a way that we realise the Slavonic temperament—it is a different mixture of flesh and spirit, apparently, from that of the west; more material in some things, less so in others, and inclined to greater extremes in action. The story itself is full of dramatic incident, and well-told, but the ultimate impression produced is that there is the real Russia of pre-revolution days, and, as the sub-title of the book expresses it, the heart of a Russian.

* * * * *

There is more than an echo of Kipling's *Jungle Book* about *Tarzan of the Apes*, by Edgar Rice Burroughes (Methuen, 2s. 6d. net), though Tarzan was brought up among apes in Africa, and the setting of the story is altogether different from Kipling's masterpiece of wild life. The author is evidently a keen nature student, and at the same time he tells a striking story, albeit rather crudely as far as the human part of it is concerned. How Tarzan learned to read while still ignorant of human speech, how he gained contact with his kind after he had reached manhood, and what manner of man he became after having spent nearly twenty years as a beast of a tropical forest, make good reading, without involving more strain on one's credulity than the great majority of novels. The test of the book lies in its last page, which promises a further volume devoted to Tarzan's adventures; we look forward with interest to the appearance of that second volume, proof that this book is well worth reading.

* * * * *

Mr. Ridgwell Cullum, whose *Triumph of John Kars* has just been published (Chapman and Hall, 6s. net), evidently knows the Yukon district through practical experience of its evils and wonders, for he describes the mining town of "North of Sixty" with the facility that comes only of real knowledge. In this book he deals with a hidden auriferous area and the crimes which it caused, as also with the punishment of those crimes. Though there is nothing out of the ordinary in the plot of the story, yet the way in which it is told, and the big surprise which is sprung alike on the reader and the hero in the last chapters makes it a notable work, in addition to the sense of things northern which the author so subtly conveys. It is not a book for squeamish folk, for the author deals with hard life in a hard country; it is, however, a novel that deals with realities, and all who have the faintest interest in the ways of the far north will delight in the book.

* * * * *

Messrs. J. D. Beresford and Kenneth Richmond have collaborated to produce the biography of a man whom they regard as the originator of a new system of philosophy. *W. E. Ford, a Biography*, (Collins, 6s. net), the result of their joint efforts is a book that will prove stimulating but not very satisfying. Ford began by studying the work of the great educationists from Comenius, to Froebel, and set up a school of his own in which he attempted to carry into practice the results of his studies. The school, finally, was shut down,

and then Ford found that in order to learn to teach he had to burrow more deeply into the systems of life that are the result of ordinary teaching—he had to find out exactly where and how his own system had fallen short. He went east, and on a visit to Japan he died with his search unfinished, leaving a mass of note-books from which his biographers hope later to compile a statement of his philosophy of life.

Mr. Beresford contributes very little to our knowledge of Ford; he has made a great attempt to picture the man, but the attempt has not succeeded, and, in his "notes" on Ford's philosophy, a vague discursiveness renders the chapter irritating. Mr. Richmond, on the other hand, gives a clear view of the man and his system which, as is stated, is that of a man who lived before his time. Many will quarrel with Ford's conclusions, and will reject his postulates in great measure, but all to whom the future of the race is of interest would do well to study Mr. Richmond's exposition of a somewhat remarkable man.

* * * * *

There is a great similarity between the work of Mrs. Edith Wharton and that of Thomas Hardy, in spite of the great difference in the setting of their story, and the fact that Mrs. Wharton deals with American character and scenery. In her latest work, *Summer*, (Macmillan, 6s. net), Mrs. Wharton portrays an ill-educated girl in a New England village; the girl experiences a grand passion with a town-bred man, who regards their love as a mere incident; later, the girl's guardian marries her to save her name—and that is all the plot. But the picture of the tiny village, overshadowed by "the mountain" where the girl was born; the actuality of the characters; and the way in which the author has got inside these people and made them alive, moving against real scenes, are much akin to the work that Hardy has done, for the little commonplace story is lifted up to the plane of tragedy, made vivid and powerful. The figure of lawyer Royall, the girl's guardian, is arrestingly drawn, more by implication than direct statement. There is more of implication than statement, as a matter of fact, in the whole book, which is as artistic a piece of work as its author has yet produced.

YOUR OBLIGATION

YOU have a two-fold duty to perform to those whom you have sent to fight your battle. Firstly, to help the State to provide for their immediate necessities, and, after the War is over, to help those dear to you to start in civil life. You can meet both these obligations by lending money to your country now.

The amount you save grows in value as the time passes.

It is a National obligation to-day to

INVEST IN NATIONAL WAR BONDS or WAR SAVINGS CERTIFICATES

FERMENT OF REFORMATION

EARLIER in the year there were placed before the readers of LAND & WATER a series of articles by a writer who signs himself "Jason," dealing with industrial problems. Writing on this subject a couple of months ago, we expressed the belief that "with tact and good sense on both sides, to say nothing of patriotism and discipline, all the outstanding labour difficulties can be overcome." Nothing has occurred since to induce us to alter this opinion. To-day we resume these "Jason" articles, and in the present issue, this writer, who has an intimate knowledge of the factors that lie behind labour unrest, defines the meaning of reconstruction from the working-class point of view. This is the view which is to-day of the greatest interest to everybody, for it is recognised that the balance of power lies in the hands of working men. They are educated; they are—the majority of them—intensely patriotic; as a class they are distinguished by common sense and levelheadedness, but at the same time they include a type of impetuous idealists who believe that the millennium can be inaugurated by one daring stroke, and are prepared to risk everything on the off-chance of securing some greater measure of freedom and happiness, in the sense that they understand these terms. It is just as well to mention that this minority is not peculiar to England. It declared itself in Northern Italy only a few weeks ago. Socialists, to use the common phrase, promoted certain riots in Genoa, Turin, and other cities; they were quickly suppressed, but with bloodshed. When the death-roll was prepared, it was found that the name of not one leading Socialist appeared on it. These men fomented the trouble, but took care to save their skins. This single incident has largely discredited Socialism among the working-classes of Northern Italy. It is an old story that saviours of the world are always available provided they are permitted to find substitutes for Calvary.

Now we do not believe that this type of mind is common in the United Kingdom, though it undoubtedly exists. A series of articles has recently appeared in the *Times* under the title *The Ferment of Revolution*, whose cumulative effect has been to leave in the public mind the suggestion that the country is on the verge of revolution. A careful perusal of the articles show that the author did not intend to convey this impression; it is rather obvious that he has argued from the particular to the general, and the idea is conveyed that in writing these articles he had at the back of his mind certain disquieting symptoms which have declared themselves in a few Cambrian mining districts. He himself in a letter to the *Times* this week has summarised his remarks thus:

Labour has so far yielded itself to revolutionary guidance that many of its most important sectional organisations are hindering recruiting, resisting reasonable industrial discipline, and demanding increases of wages which are inconsistent with the economic stability of the nation; and the Government (including its Labour members) has, in spite of its own expressed convictions, often given way to such movements.

There is truth in these two contentions provided it is recognised that it is not the whole truth. Labour has in certain directions, and latterly, hindered recruiting, but what would our position be if Labour had not thrown its full weight at the earlier stages of the war into recruiting and so provided the men who now constitute the unconquerable army of Great Britain? It is not fair to emphasise the defects of either individual or party without giving due credit for their virtues. This is where the *Times* writer failed. In the same way as regards strikes. Frequently there would have been neither strikes nor threatenings of strikes if the Government, or the representatives of Government, had dealt with reasonable grievances at the outset in a sensible manner. It is futile at this late hour to attempt to defend Government officials from dilatoriness and delay. To ordinary men of all shades and classes, the extraordinary maze of formalities in official proceedings and the waste of time and temper which these engender have been a revelation. Business men, who have become familiar through patriotic self-denial with these conditions, deem it inconceivable how any successful business can be conducted under the normal conditions prevailing in Government departments. There has been some slight improvement, but the fact remains that working men in Government-controlled concerns who have gone out on strike have been more often sinned against than sinning. This, unfortunately, taught them the power which they possess, and it is quite possible that this power, since then, has been used or threatened to be used unfairly under the present war conditions on more than one occasion.

It is well to keep two facts in mind: the first that a Briton remains a Briton irrespective of class or caste; the second, which "Jason" brings out clearly in his article to-day, that for years following the industrial revolution, the idea prevailed "that society existed for the creation of wealth." It therefore follows that if among Labour representatives certain minds still cling to the nineteenth-century fallacy and devote their energies to diverting wealth to their own class they are not necessarily Revolutionaries, but merely lawful Britons who are carrying into effect the gospel which has been preached and practised in other strata of society for several generations. The trouble is once a people bows the knee to the Golden Calf, it never knows into what divagations the idolatry may lead it. For ourselves we are of the opinion that the working-classes have been on the whole singularly free from this fallacy of wealth; they realise that money goes a small way towards the creation of a healthy and happy life, once life's necessities are provided for, and we believe, for reasons which "Jason" explains, that the war tends to promote and strengthen this idea.

But the nation and the Government have to see that more opportunities are given to the working-classes to develop their lives on right lines; we have to introduce into this land, overburdened with so many false social traditions, to say nothing of mean streets and meaner habitations, an entirely new standard of living. This will be no easy task, but the people which has faced boldly the impossibilities of the last three years and has overcome them, should not be daunted by this internal reformation, for in truth it is the ferment of reformation rather than the ferment of revolution which is stirring to-day. The *Times* has done good service in lending its columns to this exposition and discussion, for it is a question that cannot be pushed into the background. A good beginning is to be made in Mr. Fisher's Education Bill, which will be considered in Parliament this session. Hitherto education has been a subject which has failed to focus the interest and attention of M.P.'s but it is to be hoped they will approach it from a different side than formerly and recognise in the measure the Minister of Education places before them a start towards that reformation of society which is inevitable. The purpose among all classes to recreate the whole fabric of social life is too widespread to permit the delusion to persist that when the war is over, we can go back to pre-war conditions. For many reasons, some obvious, others remote, it is impossible to declare exactly the directions these many changes will follow, so it is the more advisable to consider seriously the different ways which they might pursue if wise guidance and firm control were absent.

Riga and the Western Front

By Hilaire Belloc

THE action of the German Fleet against the Gulf of Riga is (so far) only partially a military operation. It is (so far) the occupation of a maritime point by troops under the cover of a fleet. But it falls sufficiently into the military province to merit a brief description in this week's article.

The Gulf of Riga is a body of water roughly oval in shape, not quite 90 miles in breadth and rather over 100 in extreme length. It is almost completely land-locked and the great barrier which cuts it off from the main sea is the island of Oesel followed in a chain by the smaller islands of Dagö and Wormsö. This island of Oesel, with a smaller adjoining island called Moon, from which it is only separated by a very shallow narrow arm, with less than six feet of water in it, across which a ferry (now replaced by a mole) plied, forms upon the

is a sort of bar outside full of shoals, with a narrow and tricky channel, having but 7 fathoms at its deepest. This passage the German Fleet was unable to force in the days when the Russian Empire still existed and possessed a properly organised military and naval force. It was presumably thoroughly mined. Even as things now are the attack which has been launched has not yet attempted this passage, but has struck for the breakwater of the Gulf, the Island of Oesel.

Method of Landing

On October 10th a number of enemy aircraft dropped bombs upon the Russian shipping, lying presumably within the island on the side of the Gulf. Two days later, on Friday last, October 12th, two landings were effected under cover of the fleet. The first took place in the deep bay on the north of Oesel, called Tagelacht Bay. This inlet is entirely commanded from both sides and with proper shore batteries should be unapproachable. It has a good beach at the far end, shelving very gradually and suitable for landing. The second was effected near the village of Serro, the extreme southern point of the island of Dagö, which lies to the north of Oesel and opposite the railway terminus of Hapsal.

At the moment of writing, Monday, October 15th, there is no news received in London sufficiently precise to serve as a basis for judgment on the situation. We do not even know approximately what is the strength of the German forces that have landed. Some talk of one division, some of two. The whole thing is pure conjecture.

By the evening of that Friday, October 12th, German motor cyclist detachments were already appearing near Orrisar, more than 40 miles, by the sandy tracks they had followed, from the landing place. Orrisar is the village at the Oesel end of the ferry, not quite two miles long, crossing over the very shallow and narrow Strait to the island of Moon. The Russian despatches sent out last Sunday speak of some sort of fight for a crossing here, and tell us the Germans have not yet been able to force it. Meanwhile the German force which had landed near Serro met with unexpectedly strong resistance, and according to the Russian account, was beaten back to its ships.

On the next day, last Saturday, October 13th, some sort of inconclusive engagement seems to have taken place in the Soela Sound between Dagö and Oesel, but there was apparently no further landing on Dagö. Oesel, however, on which there appears to have been a quite insufficient garrison, was in part overrun, all the northern part of the island being in German hands by the Saturday evening; while the enemy also reported that the principal town, Arensboung (a small place of about 7,000 souls) was in flames.

During these actions the enemy was also actively engaged in trying to clear the mines from the Irben Channel, the main entrance to the Gulf of Riga. It would seem therefore as though the operation as a whole were designed for the mastery of the Gulf and for further action upon its eastern shore behind the Russian lines, with the object of turning these and compelling the retirement of our Allies and thus uncovering all the marshy country to the north, including Reval, the chief base of the Russian Fleet. If we look at the map we can see what the effect of a landing in force north of, that is behind, the end of the Russian line would be. It would be completely turned. It could not suddenly extend itself by the hundred miles and more required to cover Reval. All Esthonia would be exposed. This then is what would seem to be the enemy's intention: to master the Gulf of Riga with the object of landing on its eastern shore and turning the Russian line.

But all this is mere conjecture, because we are ignorant of even such an elementary point as the strength in which the attack is being made. The Russians themselves apparently regard the movement as being directed against Hapsal, the railhead from Reval about sixty miles distant from that port. It is not very clear what advantages the enemy would obtain by the capture of this railhead. If he is free to land on Oesel he is equally free to land on any part of the Esthonian Coast and there would be no object, under such circumstances, in trying to fight one's way sixty miles forward against an enemy supplied by a railway with such a base as Reval behind him. It is much more likely that the movement aims at turning the Russian line as I have said.

But I repeat, all this is guesswork. The certain thing we have to bear in mind is the unfortunate fact that Germany in this region can do pretty well what she likes. She is limited

north an almost complete barrier and, with Dagö, it forms one absolutely closed except to small boats. The width of the sound called Moon Sound between the latter island and the main land is no more than six or seven miles across and is broken by the island of Schildau in its midst. It is extremely shallow. There is but one very narrow fairway with some four fathoms of water in it. But even this is useless as an entry, for the northern side is blocked by the Kumonsky reef over which there is rarely more than 2½ to 3 fathoms at the deepest points. In other words, it is a passage completely commanded by shore batteries. But on the south, where a peninsula called Sworbe runs out from Oesel, there is a main passage into the Gulf of 18 miles, that is, nearly as wide as the Straits of Dover. The fairway is much narrower, for long sands run out for miles southwards, awash for the most part and occasionally drying off. There are no tides here but the water drops slightly in level at different times, under the effect of thaws onland, of wind, etc., and also with that mysterious "swing" which sets up upon inland bodies of water.

The actual fairway between these sands and the Irben coast opposite is some 8 or 9 miles, completely overlooked from the Domeberg, 280 feet high, behind Irben. This fairway is deep, with from 11 to 14 fathoms of water, but there

only by the fear of entering into heavy commitments on the East with forces severely reduced and with her fate clearly dependent upon the Western fighting where two-thirds of her armies and the overwhelming mass of her material is concentrated in the effort to stave off defeat.

THE WESTERN FRONT

On the West the week was marked by two successive blows, the fourth and the fifth of those launched by the British Higher Command during the present offensive; and each of these blows was further remarkable for the unprecedented rapidity in preparation which it showed.

On Tuesday, October 9th, was fought an action the news of which reached London too late for inclusion in our last issue. It was the first of these two last blows and was struck from the south of Houthulst Forest in the north to the eastern slopes of the Ridge just south-east of the Broodseinde Cross Roads on the south. On the extreme left the French co-operated with us, the British left (on the right of the French) consisting of English, Welsh and Irish troops and the Guards. In the centre was a Territorial Division comprising the Manchester, East Lancshires and Lancashire Fusiliers regiments; on the right by Broodseinde were the Australians.

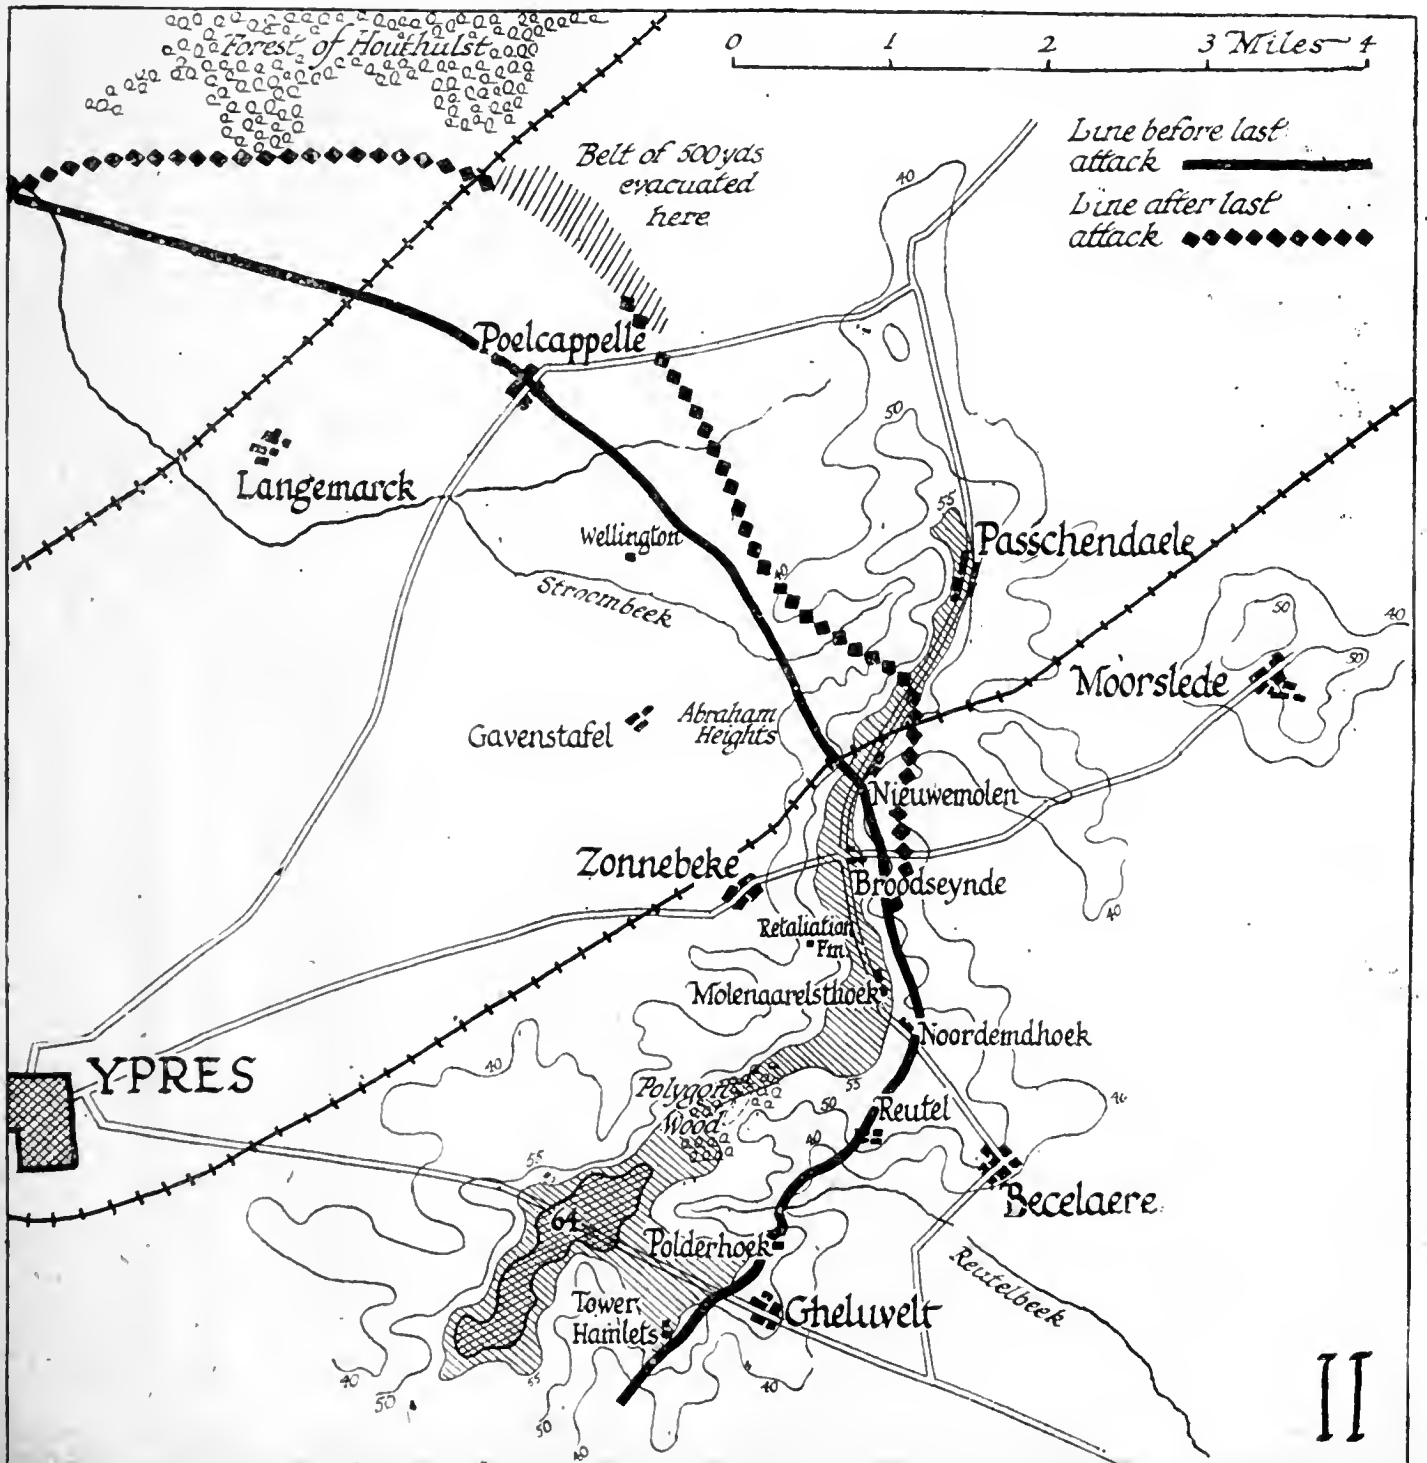

The attack, which was launched at twenty past five in the morning, had again something of the effect of a surprise; especially on the north, between the railway and Poelcappelle, where two German divisions were caught, the one in the act of relieving the other. The troops coming in, those of the 227th Division, naturally suffered the most. It had rained heavily during the night and the difficulties of the low ground were

very great. And some hours after the first advance of about a thousand yards the local difficulties, especially apparently those of transport, necessitated a retirement over about half the belt occupied. It was not, by the accounts received, undertaken under enemy pressure nor with any recorded loss.

On the ridge itself an advance of one mile towards Passchendaele was effected by the Territorial division just mentioned, on the left of whom were the Warwickshires and certain units from Yorkshire. The objectives fixed here fell short of the ruins of Passchendaele. Nevertheless a portion of the British forces appear to have entered these ruins for a moment, pushing beyond their objectives as was the case last week in the Australian advance up the road from Broodseinde. They fell back later on to the objectives originally assigned for them.

By the evening of the second day the total amount of prisoners was just over 2,000, of whom 400 had been taken by the French.

Rain fell at intervals during and after the advance, and the chances of a repetition of the attack seemed to grow worse and worse. Nevertheless, after so short an interval as only three days from the inception of the fourth blow a fifth was launched at 25 minutes past five in the morning of Friday, October 12th, upon much the same front, but excluding the portion near Houthulst Forest where the French had previously advanced. Very heavy rain had fallen again in the night before this attack which was therefore made under the most difficult conditions conceivable. The rain set in again with the later morning and the attempt to push the thing farther was abandoned. This stroke was also successful within its limits, counting before it was over 943 prisoners. Later, during the Saturday, heavy rain continued to fall

throughout the night and morning, and further action was, for the moment, impossible.

It is clear that the weather conditions all further activity now in Flanders. We have reached the same time of year

as that which imposed limits upon the battle of the Somme and for the same reason. The sun has no longer sufficient power to dry the ground even after moderate rain, and anything like really wet weather stops operations entirely.

The Conditions of Victory—II

I BEGAN this series of articles by noting that immediately upon the destruction of the enemy's offensive power in the West and his being thrown back upon an increasingly doubtful defensive, he had no chance of escape from ultimate defeat—in spite of the Russian collapse—save through some political manœuvre.

This political manœuvre was the industrious propagation, first by his agents, next by his friends, and after that by their dupes, of three consecutive propositions.

The first of these propositions was that the German people were not responsible for the war and its hitherto unknown atrocities: the character it has increasingly borne of breaking with every law, convention, and moral standard of civilized Europe. The war and its wholly novel abominations were due to a few wicked rulers from whom we had to free the innocent mass of the enemy.

The two propositions following on this were, the second one, that the defeat of the Central Powers, in the field was impossible and that therefore it was necessary to negotiate, and the third (to which these first two led up) that, as we had to negotiate at last, it would be well to lay down at once in detail the terms of a peace which the Allies could accept.

I said that these three propositions, and especially their conclusion, were equivalent to a demand for parley; that a demand for parley was a demand for truce; and that a truce with an unbeaten enemy was the prelude to acknowledging his successful defence. I said, therefore, that what we had to do was to reject the whole scheme, after noting the falsehood of the arguments in its support, and to replace it by considering our conditions—not of peace, but of victory. In other words, to consider what things were necessary to our future and to the stability of Europe as the fruits of our full military success: *things which an unbeaten enemy will certainly not give us, but which a beaten enemy will be compelled to give us.*

The first part of my task, then, is negative: I have to exhibit the falsehood of the arguments the enemy and his friends are using. After that only can I approach the positive part which is the statement of what the conditions of victory are. In this negative part I examine the triple proposition of the enemy and his friends. Last week I dealt with the first of his proposals. This week I will deal with the second, and the week after with the third.

Negotiation

The second proposition put forward by the enemy's supporters and, for that matter, openly by his own statesmen and soldiers, is the proposition that as a decision in the field is now impossible, there is nothing left but negotiation; the mere prolonging of the struggle under such circumstances is a useless and terrible expenditure of life and subsistence, and threatens a common ruin to both parties.

Let us bring into relief the main fact about this proposition: *it is advanced by the enemy.*

It originated *with the enemy*: first in a crowd of articles and suggestions which began to appear during the battle of the Somme, next in a definite and even urgent demand for peace which issued from Berlin in the second week of December 1916, when the results of the Somme were fully known—but before the collapse of Russia.

All that has followed since, whether from well-meaning neutrals or from men who had no nationality and to whom, therefore, the war was a meaningless tragedy, or from the direct agents of the enemy, has been but a development of the policy clearly originated in the summer of last year and publicly enunciated *by the enemy himself* at the end of last year's critical battle: A battle, be it remembered, which definitely proved to the enemy that his offensive power was at an end and even his defensive system doomed.

If we do not bear in mind this capital fact that the suggestion of negotiation has come *from the enemy* we shall misunderstand the whole psychology of it.

Of the various forces which were grouped for the maintenance of civilization against the Prussian menace of 1914, not one in the West has made default. Of the forces that were grouped for the conquest of Europe in 1914 all have made default. The Western Allies maintain their original position. Prussia and her allies are already giving way. That is the core of the whole matter.

In July 1914 the attitude of the two sides was this:

The Central Empires, organised under Prussia, proposed to do what they willed with the small nationalities of the Balkans, to control the route to the East through these, and, since the military power of France was their most serious opponent (though counting only a third of their numbers), they proposed early to destroy that military power in a brief and necessarily successful campaign. This done Prussia and her Allies would have been the unquestioned masters of Europe. But there was more than this. It was openly announced—and the announcement was carried out in practice—that the old moral tradition of Europe, its conventions in war, the sanctity of neutral territory and the security of non-belligerents would be disregarded. We were told in so many words what countless writings and speeches had already led us to expect, that Prussia denied validity to the old international morals of Europe and proposed to achieve her aggrandisement by a contempt of them.

When Great Britain entered the field, the military machine of the Central Powers was already well under way, no modification of its movements was then possible, and those who had deliberately challenged the civilization of Europe asserted (and believed) in spite of their evident annoyance at this accession of strength to their foe, that the rapidity and success of their overwhelming numerical power would decide the issue before blockade could come into play. As for a serious development of British military power by land, they did not consider it possible for one moment.

There you have briefly stated the thesis of Prussia and her Allies in launching the war. Every other pronouncement than this has been an afterthought produced ultimately by the Marne. These afterthoughts have contradicted one another and have fluctuated back and forth with the fortune of arms. The nearer defeat seemed the more generous or the more pitiful was the attitude of the original aggressors. Each accident postponing defeat led immediately to a different tone.

Mastery of Europe

The one thing that stands historically unassailable is the original motive and action of our enemies. They proposed to master Europe. They were certain of their power to do so and they affirmed in theory (and carried out in practice) the rapid achievement of victory by a contempt for all the old traditions of Europe at war. There was no talk in those days, when the issue was clearly marked, of the war being an aggression on Prussia by England. That was merely an afterthought and a clumsy one. So far from its being true it is clear that the enemy believed up to the last moment that England would not enter the lists. There was no talk of the horrors of war, the pity of their continuance; on the contrary they were proclaimed as a sort of good—because it was believed they would fall upon the opponents of Prussia. There was no talk of freedom of the seas or freedom of nations or races, or freedom of anything. There was a plain plan of conquest by methods admittedly devoid of morality.

On the other side there was an equally plain political thesis. Its base was the defence of all that had been known as European civilization. It stood for the maintenance of sovereign national rights, especially in the smaller sovereign States, for the observance of an accepted chivalry in war and for the saving of all our traditions. It was clear that the only means of doing this was to break the Prussian military machine. In other words, to defeat it decisively in the field.

Within the nations which successfully undertook this task were elements either favourable to the enemy or so ignorant or so strangely enthusiastic that they did not understand the value of patriotism and the meaning of nationality. Those elements, from the beginning in France as in England, in Italy before she joined the war, as in the United States before that country entered, argued against the defence of Europe and in favour of yielding to the enemy. They were weakest in France because France was directly and physically menaced. They were strongest in the nations which were either less directly menaced or stood out for some time from the struggle. We all know what those elements were. We all know who their leaders were. There has been no conversion and no change. Exactly the same people who talked Pacifist and internationalist nonsense, or who more soberly argued for the neutrality of their nations two years ago, are continuing the work to-day. There has here been no

general modification in the West due to the process of the war—or very little. The general purpose of the Western Allies remains what it was at the beginning. On the enemy's side there is a prodigious change. It is a change affecting whole populations and the very mind of the combination which set out to conquer us. They have come to an open repudiation of their original intention and to a negation of what seemed in 1914 their ineradicable political philosophy. Prussia (for the first time in all her history) is using the word "freedom" and talking of "national rights." The most enormous of all the enormous symptoms of the thing is the fact that Prussia is now at last compelled to propitiate Poland.

That, I say, is the capital mark of the whole affair. It should be the foundation of our judgment to see it clearly—and therefore it is the great object of the enemy and his supporters, direct and indirect, at this moment to confuse us upon that capital point.

They assure us that the movement is a general one; that "all parties" are equally weary; that the tone is "everywhere" changed. So stated it is a falsehood. Obviously, three years of war will weary all men, victors as well as vanquished, more than one year. But so far as direction of effort is concerned, the change is a change upon the enemy's part and not upon ours. And the reason is simple. It is that the enemy, formerly certain of victory on a purely military calculation, is now on the same calculation equally certain of defeat. He has only the political avenue of escape left him, and therefore he has turned to that.

Enemy Propaganda

This, then, is our conclusion on the fundamental point. The Peace Propaganda is an enemy propaganda. It is the enemy that turned to it and not we; it is the enemy who is trying to drag us in to it and we who must resist.

There follows an immediate corollary from this fundamental truth, which is that the statements on which this propaganda reposes are necessarily suspect in our eyes. When we look at those statements we shall find that our suspicion is very reasonable, quite apart from the fact that the proposition is an enemy proposition.

The enemy statement we are considering here may be put thus briefly in simple words:

"You cannot defeat me, of course; yet I am willing to give you *part* of the things which only defeat could wring from me."

Of course, the matter is not put so simply or with a contradiction so glaring. The way it is put is: "A decision in the field is impossible short of mutual ruin, therefore let us negotiate." But the briefest and truest form of it is what I have said: "You cannot defeat me, of course; but I am willing to give you part of the things that can only be wrung from me by defeat." A strange attitude!

The enemy, so long as he had the slightest chance of victory, far from conceding anything talked openly of indemnities, of the probable annexation of French territory, of the certain annexation of Belgium, of the "punishment" of Italy, and all the rest of the phrases with which we were exceedingly familiar not two years ago. Surely even public opinion cannot be so short-memory'd as to have forgotten already those phrases and declarations? Have we forgotten Bernhardi's definite prophesy at the end of 1915 that, with the spring of 1916, France would be overrun? Or the memorandum upon the annexation of the French ironfields in Lorraine? Or the later declarations upon Belgium? Is it possible that anyone can have forgotten the earlier claim to hold the Channel Coast as a permanent threat against England? Or the discussion of the exact amounts which a defeated Western civilization would have to pay? So long as there was the least chance of victory for the enemy *that* was the tone.

If we were to put the matter in plain question and answer it would stand somewhat thus:

"Why did you not talk like this during the battle of Verdun?"

"Because I then thought I could get a decision in my own favour."

"Why did you not talk like this before the Trentino fiasco?"

"Because I did not think it would be a fiasco. I expected a decisive victory, the cutting off of the whole Italian Army and the overrunning of the Italian cities."

It comes then to this. So long as the chance of victory was with the enemy, a decision was possible and negotiation was ridiculous. Now that the progress towards victory is on our side and against him, behold! a decision is impossible and negotiation is the only way out! Really the argument is a little too one-sided.

The enemy's attitude and that of his supporters and apologists at the present moment may be compared to that of a man heavily pressed for money who enters into some such

THE CREDITOR: "Your payment has fallen due. Can you pay? Are you solvent?"

THE DEBTOR: "Oh, yes! I am quite solvent. But first of all let us see whether you will not rather accept something in the pound."

We all know what we should think of the man who replied thus in a commercial matter and where his credit would stand. It is an exact parallel to the bluff which the enemy is putting up at this phase of the war.

The truth is that the whole argument depends upon the statement that a decision is impossible. It is a statement which the enemy and his friends make, and it is a statement manifestly false.

"Permanent" Defences

The enemy constructed his original defensive lines in the West with the manifest intention of holding them intact until he could secure an inconclusive peace. In their largest plan as in their details those lines are a clear confession of such a policy. No one who has seen the work he put into them can doubt that. They amounted to a declaration that it was worth while to do so much because doing so much gave him an impregnable position.

Well, the first step was that those lines proved far from impregnable as the armament of the Allies proceeded. The Battle of the Somme was definite proof that this armament—then, remember, only in the middle of its expansion—could destroy a system it had taken the enemy two years to complete.

He fell back upon the idea of successive trench lines; the chief of them, constructed with immense labour and obviously designed for permanence, lay along the Bapaume Ridge. He was shot off the Bapaume Ridge almost before he had properly fallen back upon it.

The next step in his decline was the determination upon a local retirement and the evacuation of the Noyon salient. He drew across that arc a chord which is generally called the Hindenburg line. It started with the Vimy Ridge and was (and is) an enormous double work, including miles of tunnel and hundreds of elaborate posts constructed for permanent defence which ran down past St. Quentin along the Chemin des Dames to the neighbourhood of Rheims. In the spring offensive of this year that line was broken up in place after place.

That the attack did not produce a general retirement does not affect the argument. He built this thing as permanent fortifications are built, not as field works are built, and yet he lost its continuity.

Changed Tactics

Then came, with the end of this summer, a further confession of inferiority—really the most significant of all; the continually increasing fire power of the Allies and particularly of the British, compelled him to abandon the trench system altogether at the point where pressure was most fierce. He fell back at a very heavy expense in men upon a system of isolated posts, of formation in depth and of repeated and murderously expensive counter-attacks after each sacrifice of ground. Whether yet another type of defence can intervene between this last step and the final failure of the defensive we do not know, but the thing is clearly progressive, and the progress is continually against him and in our favour.

In a word, the doctrine that a decision is impossible is nonsense. If we under-estimate the time required to arrive at such a result, we shall naturally be disappointed. If we make no guess at any precise term, but appreciate the direction and inevitable progress of the operations, we have a true judgment of the situation.

Both parties suffer. Both parties increasingly suffer. But the party which is now in the process of undergoing progressive defeat, suffers, on the civilian as on the military side, in material as in men, as in casualties as in *moral*, more and more, and the victors less and less. The curves are separating and it would be madness now that that separation is getting accentuated to check it by accepting the enemy's demand for a parley and a truce.

H. BELLOC

An Allied Naval Policy

We regret to announce that more than half of Mr. Arthur Pollen's article on the Naval Policy of the Allies has been eliminated by the Censor.

We do not consider it would be fair, either to Mr. Pollen or to our readers, to present his arguments in an incomplete form, and so we are reluctantly

"Bagdad at Any Cost"

By Lewis R. Freeman

"**B**AGDAD at any cost!" The endless iteration of that expression in the German press during the last three months has been only one of a score of signs indicating that the octopus of Middle Europe was as implacably resolved to extend its most easterly tentacle to its full length as it is not to relax the stranglehold which its most westerly one has thrown around Belgium. And it should by no means be assumed that the stinging rap which General Maude has dealt to one of the Turkish feelers of this eastern arm at Ramadie is calculated to arrest more than temporarily the impulses which have been set going from the monster's Teutonic nerve-centre.

With Falkenhayn directing in person the strategy of the enemy in the Near Eastern theatre, there is every reason to believe that the campaign to regain Bagdad and re-establish the waning prestige of the Teuton east of the Bosphorus will be vigorously prosecuted; but even so, there is still more reason to believe that not only will an adequate defence be maintained, but that the chances for a further British advance—should such a move commend itself to those directing the campaign—are far from unfavourable. There has been no time since the recapture of Kut when British moral and organisation in this theatre have not been far above those of the enemy; but even assuming the opposing armies to be more or less balanced on this score, there are still two important factors which in themselves would be sufficient to create a situation increasingly unfavourable to the enemy. These are transport and what one might call the local economic situation, neither of which appear to have been fully appreciated in England. I shall touch on each very briefly before going on to a discussion of what Mesopotamia means, or might mean, to the British Empire.

Communications

From the inception of the Mesopotamian expedition, the British had, potentially at least, all the best of it on the score of communications, and the disaster to Townshend at Kut-el-Amara was due—more than to any other one thing—to the failure to take advantage of the opportunity to develop an adequate system of paddle-wheel steamer and barge transport on the navigable Tigris. With the river transport as at present carried on (with its auxiliary of light railways), it is not too much to say that the British are in better shape to maintain an army on a front in the latitude of Bagdad, and even up to and perhaps north of Samara, than the Turks would be if they had a single-track railway all the way through from the Bosphorus. The fact that the Mesopotamian army must now draw a far greater amount of both its food and munitions from India than it did in its first year, must also make a great difference in the problem of sea transport.

As to what the Germans have done to improve the Turkish transport we can only speculate. The Bagdad railway is usually shown on the strategic maps published in the Allied countries as coming to an end at Nisbin, about two-thirds of the way across from Aleppo to Mosul, on the Tigris. If it is true, however, that the tunnels have been completed and rail connection established through the Taurus and Amanus mountains, there is no reason that material should not have come rapidly enough to carry the rail-head much farther east, and possibly all the way into the amphitheatre of brown hills where Mosul looks across to the ruins of old Nineveh. Even this, however, would still leave the Turk at a great disadvantage, for he certainly has not the rafting material that would make it possible to float supplies to his armies down the shallow but swift-flowing Tigris.

No probable development of the Bagdad Railway along its original route is likely to give the Turks communications comparable to those already at the disposal of the British, but the thing of which one would like to have assurance, is what he has done in improving the direct route from Aleppo to Bagdad down the Euphrates. The very sizeable force which fell a victim to General Maude's masterly strategy almost certainly came from this direction, and the fact that several disassembled engines were among the booty might be taken to indicate that some sections at least of this route had been bridged by rail. While the chances are that the captured railway material was brought there for *future* use on the light line which runs across from the Tigris to the Euphrates at this front (after it had been taken from the British, of course), it should not be forgotten that the Euphrates route is not only the most direct one between Aleppo and Bagdad, but that it is even freer than the other from heavy engineering work. Indeed, I have already mentioned in LAND & WATER

how Meissner Pasha, who was then engaged in building the Bagdad Railway, practically admitted to me in the spring of 1912 that political rather than engineering or commercial considerations had been responsible for carrying the survey across the half-desert hills of Upper Mesopotamia to Mosul. The idea was, he gave me to understand, to "flank" Armenia, and to make ultimately of Mosul a junction point from which dominating strategic lines would radiate to northern and central Persia.

Down the Euphrates

There is little doubt that if the Germans could have seen ahead to a two or three years' campaign in Mesopotamia when operations were first planned for this theatre, they would have left the railhead on the original survey of the Bagdad Railway just where it was—somewhere out towards Ras-el-Ain—and devoted all their energies and material to pushing a line down the Euphrates. There would have been some cutting and filling—though all in soft earth—to do, but it would have been possible to raft material down the river, construct and inaugurate traffic on the easy stretches, and then link these up as the slower work was finished. It is not impossible that something of the kind may have been attempted in the last year, although the chances—on account of the increasingly insistent demands of Europe—are much against it. Anyway that one figures it, it seems certain the British will have all the best of the transport to the end.

How much the British stood to profit—and the Turk to suffer—when the latter was finally pushed out of the irrigated area roughly included in the triangle Bagdad-Kerbela-Kut I have never seen made adequately clear in any of the reports of General Maude's advance up the Tigris. This area together with some marsh and much land and not under canal—takes in practically all of the irrigated and intensively cultivated area of Mesopotamia. All the rest of the cultivation along both Tigris and Euphrates consists only of inconsiderable patches where water has been raised from the river by wheels. While the Turks were in undisturbed possession of this area, they had an unlimited supply of fodder for their horses, as well as of most of the foodstuffs consumed by their army. There is no other area of cultivation sufficient for feeding an army nearer than Aleppo, and all Syria had been famine-stricken for a year in consequence of the taking of food for the armies. When the Turk was pushed north of Bagdad, however, he found himself compelled to establish his front in a region which was a complete desert away from the rivers, while even along their banks the patches of cultivation were only sufficient to eke out the lives of the villagers who maintained them. For the supply of foodstuffs the pressure on the Turkish transport must have been increased many fold from the day he dug himself in across the low table-land above Samara. The soil of most of the region of Upper Mesopotamia is rich, but its pitifully small rainfall could only be made to nourish crops under the most scientific "dry-farming" methods, into the mysteries of which, it is scarcely necessary to add, the Arab *fellahin*—the only available cultivators—have not yet been initiated. If the Germans are still going to insist on the Turks maintaining a fighting force in Mesopotamia, they have either got to take Bagdad, and the region south of it down to Kut, or else bring the food for that army from the already depleted granary of Asia Minor.

The British army, in entering the cultivated area of Mesopotamia after the fall of Kut, naturally reaped most of the advantages of which the Turk had been deprived on being driven out of it. Flour and most of its meats it doubtless still has to bring from India or Europe, but the saving of transport on fodder, vegetables and fruits must be very considerable. I have never heard that the Turks destroyed the great barrage at Hindia, on the Euphrates, before retreating, and with this and its canal system intact, the food production of this part of Mesopotamia can—with the importation of coolie labour from India—easily be kept abreast of the demands any army of occupation, no matter how large, can possibly make.

At a time then when it appears assured that, barring unforeseen disaster, the indefinite tenure of Bagdad—with all it stands for—seems only a matter of "carrying on," it may be apposite to consider what Mesopotamia means, or rather might mean, to the British Empire. For a good many centuries it has been the custom to refer to the Tigris-Euphrates Valley as the world's greatest "graveyard of Dead Empires" without giving a thought as to whether or not the restoration of the conditions which enabled Empires to flourish there

might not make it anew the home of the civilization of which it was the cradle. Then, six or seven years ago, a man came along with not only a well-maintained thesis to prove that the desert was the original site of the Garden of Eden, but with a fully formulated plan to make a new garden of it, a garden more extensive and more fruitful than that of the Nile. It is impossible to speak of the future of Mesopotamia without bringing in Sir William Willcocks and the Nile.

Two Most Famous Valleys

It is a remarkable fact that what are undoubtedly the world's two most ancient and opulent seats of empire, the valley of the Nile and the valley of the Tigris-Euphrates, should both have ultimately become for the most part two of the most sterile of the world's deserts. But more remarkable still is it that when, after the lapse of a score or more of centuries, the destined hour of their rehabilitation came round, the master transformer of each who in time will restore both valleys to a fruitfulness undreamed of by Rameses or Nebuchadnezzar, should be one and the same man, and he not a king nor an emperor, but a quiet unassuming Englishman, with the practical brain of an engineer and the imaginative soul of a dreamer. It is as a dreamer—a constructive dreamer—in fact, that I like best to think of Sir William Willcocks. On the memorable occasion on which I first turned the pages of his "Garden of Eden" reclamation report, there was nought that I envied Keats his pioneering jaunt which provoked his rhapsody on "First Looking into Chapman's Homer."

It was an evening of May, 1912, in the Bagdad Club Library that I picked up a volume of the "Thousand and One Nights" and sought a reclining chair under a punkah. I had intended whiling away the hot evening by following the inimitable Haroun-al Raschid through the highways and byways of the ancient city of the Kaliphs, but I chanced to start turning the leaves of the green-bound engineering report which I found on the arm of my chair, and instead of trailing at the skirts of the good Haroun, I found the car of my fancy hitched to the Pegasus of Sir William Willcocks and whirled off across the ages to the days of the Garden of Eden, swung back in a sweeping circle through the Deluge, the rise and fall of Chaldea, Babylon, Assyria and Hitt, on down to the present and beyond to that future when the transmuting touch of water was to restore all that was worth restoring of the glories that had gone before. It was with Willcocks, the dreamer, that I rode that night.

Twenty-four hours later, with a clear-eyed sun-tanned Scotchman, I stood at the awninged window of a drafting room looking down into a quarter mile wide hole where a couple of thousand Arab labourers and a confused mixture of pumps, engines, dredges, cement-mixers and steam-shovels were doing the preliminary work of the foundation of the great Hindia Barrage, the completion of which, a year or more later, raised the waters of the Euphrates and turned it back into its old channel by the walls of Babylon. Opened between us, and supplemented by a portfolio of maps, lay a green-bound report similar to the one I had found in Bagdad the night before, and my companion turned often and read from it as he pointed and explained. But always it was columns of figures—estimates of flow and fall and siltage content—that he quoted; these magic pages glowing with fascinating interweavings of fact and fancies regarding Eden and the Deluge and Belshazzar and Sardanapalus were unturned. It was Willcocks, the engineer, not the dreamer, whom we followed that afternoon; the engineer transforming into realities the visionings of the dreamer.

It is a significant commentary on the confidence with which Turkey still regarded England up to 1911-12 that, in spite of the fact that German intrigue was at its height in all parts of the Ottoman Empire at this time, the Government should not only have turned to a British engineer to draw up its plans for the greatest reclamation project ever planned, but should also have awarded all of the first construction contracts—involving the expenditure of many millions of pounds—to a British firm. That this was done in the face of strong endeavours on the part of the Germans (who were already at work on the Bagdad railway) to secure at least the construction contracts for themselves, indicates how small a British effort might have been successful in saving Turkey from her final entanglement with Germany.

Perhaps no better idea can be given of the incalculable promise of the future that awaits Mesopotamia if ever a stable government is established there than to outline briefly the salient features of the Willcocks project. Many of the names—such as Kut and Ctesiphon—of subsidiary projects have since become bywords. Indeed, General Maude's latest victory at Ramadie involved operations over the Habbania overflow area, the utilisation of which to take care of the surplus flood waters of the Euphrates formed really the initiatory project of them all.

The great problem that confronted the first builders of extensive irrigation works in Mesopotamia must have been that of disposing of the excess of water in flood time, and had not the solution been found at the outset it is certain that all their efforts must have come to nought in the end. The decline of the great Babylonian canals must have dated from the time when, either through neglect or through destruction by enemies the flood protective systems became partially or wholly ineffective. That the irrigation systems of the succeeding empires had but ephemeral existence was due to the fact that the complete restoration of the flood works was not made a condition precedent to irrigation.

To Sir William Willcocks, with his life-long experience in curbing the eccentricities of the Nile, the imperative necessity for providing some sort of a flood escape for the surplus waters of both the Tigris and Euphrates must have been apparent at once, and his first attention, after being commissioned by the Turkish Government to outline a plan for the reclamation of Mesopotamia, was directed to this end. Investigations were first made on the Euphrates, and, guided by a broad belt of shells in the desert to the north-west of Kerbela, a great depression having an area of 300 square miles and a depth of fifty feet, capable of receiving a flow vastly in excess of any flood recorded in modern times, was discovered and surveyed. The belt of shells and traces of old canals and diversion works pointed strongly to the fact that this depression was utilised by the ancients to the identical end it will serve when the Habbania Escape—which was under construction on the Euphrates at the outbreak of the war—is completed. This work will approximate in steel and concrete what the ancients built for the same purpose in sun-dried brick cemented together with bitumen. When it is finished the way will be clear to take up systematically the canalization of the great area—the Hindia Barrage alone commands 1,360,000 acres—which can be irrigated from the waters of the Euphrates.

Tigris Floods

The handling of the flood waters of the Tigris which, although having slightly less average discharge than the Euphrates, swells to far above the maximum flow of the latter in spring time, is a more difficult problem. There are two alternative solutions, one being to utilise as an escape an extensive salt sink to the south-east of Samara, in which the river Tarrhar now discharges and terminates, and the other the simpler plan of abandoning the left bank of the river to the floods and creating a massive canal and dike along the right bank. The principal objection to the escape project was its estimated cost of £6,000,000, and Willcocks' recommendation was in favour of the one involving the abandonment of the side of the river until such time as more money was available. It will be seen that the "cramping" efforts of Turkish finance were evident even in the tentative outline of this project.

With the menace of the floods disposed of, the several projects for bringing the lower valley under canal were to be taken up as fast as the Turkish Government could provide the money. These projects, a score or more in number, if ever completed, will have brought water not only to all of the country irrigated by the Babylonians, but also to many hundreds of square miles that did not exist at the time of Nebuchadnezzar—and built out into what was then the Persian Gulf by the silt-laden rivers.

A fairly extensive but relatively cheap piece of reclamation was projected at the great Ctesiphon loop of the Tigris, where Townshend administered so stinging a defeat to the Turks before falling back on Kut. Here a quarter of a mile wide neck of land separates two points on the river, which are thirty miles apart by its winding channel. A two or three-metre fall gives the opportunity to bring nearly all of the looped-in area—about 250,000 acres—under canal. The consummation of this project was expected ultimately to result in the destruction of the famous Ctesiphon ruin, the arch of which is the largest ever constructed.

The great Hindia Barrage was the first of the Willcocks projects to be undertaken, because it was possible to proceed with it regardless of the completion of the Habbania Escape which was to dispose of the flood waters of the Euphrates and upon which all the other projects had to wait. The dam at Hindia is designed to turn a large part of the flow of the Euphrates into its old Babylon channel, restoring to cultivation hundreds of thousands of acres which had reverted to desert through the silting up of the ancient river bed. The Turks—in true Turkish fashion—had endeavoured to do the same thing twenty years previously by erecting a low weir across the river a short distance below the site of the present barrage. This structure, which was built entirely of bricks quarried from the ruins of the Tower of Babel, the palace of Belshazzar, and other historic buildings of Babylon, did good service while it lasted, the water in the old channel being raised to a level which made it possible to bring a considerable

part of the abandoned area again under cultivation. It began going to pieces in the first heavy flood, however, and, through the great losses suffered by those who opened up new land only to be compelled to abandon it as the water in the old channel sank back to its former level, was ultimately responsible for more harm than good.

At the time of my visit to Babylon I found the German scientists excavating there in a terrible state, because the raising of the water in the old Euphrates threatened to defeat forever their long-cherished plan to delve deep under the ruins of Nebuchadnezzar's capital to uncover a prehistoric city of equal size which existed on the same site. It was feared that the increased soakage from the raised water level would make it out of the question to carry on excavations at any depth at this point. The spectacled Teutonic savants were in a high state of indignation at the prospect, but to the average individual half a million live and prosperous farmers would weigh rather more heavily in the balance of expediency than a row of cases filled with the bones and ornaments of

dead men, and a ponderous tome filled with theories regarding life in a dead city.

The Hindia Barrage was completed some months before the outbreak of the war, and while it is not possible that the original scheme of distribution of the water it made available, could have been followed very far, there is no doubt that the Turks and Germans brought a good deal of new land under canal to increase the food supply of the armies. As both of them undoubtedly counted on a speedy return, it is not probable that there was much destruction attempted of works of this kind.

A clear road to the fulfilment of Sir William Willcocks' magnificent dream of a restoration of the Garden of Eden has only been opened since the British hold on the Tigris-Euphrates Valley has appeared to be definitely assured, and if the British people will begin to think of Mesopotamia as bulwarking the landgate to India just as Egypt does the water-gate, it is by no means impossible that this road may be followed to its end.

What is Reconstruction ?

By Jason

IN sixteen hundred and sixty-six, when, as we were told in the nursery the fire went out for want of sticks, London had a rare opportunity. For four days the flames had been destroying the squalor as well as the splendour of the past. It happened that one of the greatest architects produced by our nation was alive, and in the full vigour of his powers. Sir Christopher Wren seized the moment and in a few days he had drawn up a scheme for rebuilding London which would have given to the capital an atmosphere of space and design. If his plan had been accepted St. Pauls would have not been hidden behind narrow and crooked streets. It would have stood out as a Greek temple stands out, so that the eye of traveller or citizen, whether on the river or on land, would run easily and naturally over its great outline with nothing to break the spell of the perspective. For the street leading up Ludgate Hill was widened as it approached St. Paul's, dividing itself into two great avenues, one on either side of the Cathedral. The great features of the city, cathedral, public offices, river, were all given a setting that would display their beauty and importance. All London was to be built with wide streets, smoke was to be banished, the churchyards were to be planted and adorned, and the imagination of every Briton was to be excited and enriched by the noble dignity of his home.

Unhappily for us and for all who have lived since those September days, Sir Christopher Wren's dream seemed too ambitious for the Government of the day. The rights of property, the claims of economy, the urgent need of rehousing the population of London before the winter, all these were pressed on the Court, and Wren's plan was rejected. So though we may love London as well as Morris loved her (he used to say that her soot had been rubbed into him), we love her in spite of disfigurements, and the more we cherish her history the more we lament that this great scheme still lies at Oxford, in the Library of All Souls, a picture of the London that might have been.

In which Spirit ?

The great fire of London lasted four days, and the great fire of Europe has already raged for more than three years. In which spirit are we going to reconstruct that part of Europe in which we live ? Is it to be the spirit of Sir Christopher Wren or the spirit of the Government of Charles II. ? Are we going to remake our world in a spirit of faith and hope, or are we going to put the bricks of our old world back again and restore the conventions of the past ?

A crisis so tremendous as this drives even the least reflective mind to question those conventions, to penetrate beneath that surface where his questioning used to stop dead, to ask what purpose is served by this or that institution, this or that kind of life. This is itself an immense event in any society. For the custom of accepting the world as we find it is perhaps the most powerful force in our nature. We see millions of people toiling for long hours, we see conditions of life that are revolting and painful, we see all round us an ugly and distressing civilisation, and for the most part we take all this for granted. It is not what we should wish, but there it is, and we say in a tired way to ourselves that it is not likely to be altered very radically in our lifetime. The mind soon ceases to be distressed by anything that seems to be inevitable, especially if the body that actually suffers belongs to someone else. Hence it needs a great shock to awaken

a society to some fundamental change of outlook. Such a shock has come to England and to the world, and the defeat of Germany is not more important for mankind than the nature and the scale of the change of spirit that will result from it.

The Greek Conception

It has been said that after every great crisis the human mind goes back to the Greek spirit, the Greek conception of the serene and equable life, the disentangling of purpose and motive. This is another way of saying that there is some saving and sovereign quality in the imagination of the race to which we fly for peace and hope from the distracting tumult of conflict and violence. That tumult brings with it a new and simplifying sense of reality. In the act of overwhelming the race by some stupefying calamity, it frees the race from the burden that has kept half its mind captive. Such a burden has weighed upon us for a century in the material standard we set for our civilisation. For a hundred years we have been living under the tyranny of a particular economic creed. Our political economy has deserved the name of dismal, because the circumstances of its birth have given it an unreality that is melancholy and morose. An analysis of one set of forces, it was accepted by the age of the Industrial Revolution as an analysis of all life, the key to all the mysteries of the world. So it came to be the universal arbiter and instead of seeking to control their surroundings men came to think of all nature as governed finally and unalterably by some strange and dreaded law. The Incas, who worshipped the sun, were freer than the men who made a god of the law of supply and demand, for even in Peru the sun is sometimes veiled, but the law of supply and demand seemed ubiquitous and all powerful.

After the great war with Napoleon we reconstructed our society under the spell of this power. Our ancestors thought that society existed for the creation of wealth in a material sense, and that the difference between a civilized and an uncivilized people was in the main a difference in the capacity for the production of wealth. The life of a nation was to be subordinated to this imperious demand. If anyone looks at the early discussions of factory reform, he will find that they turn almost entirely on the danger of letting France or Germany steal our trade. Consequently, the most terrible conditions were tolerated as the alternative to the loss of trade. Children became hereditary factory slaves, towns grew up in hideous form, men and women were reduced to the utmost degradation, and the triumphs of our industry all over the globe left the great mass of our working population less free than the inhabitants of a Red Indian village. This conception of value and purpose in national life did not satisfy everybody, but it satisfied the ruling class as a whole, though of course there were distinguished exceptions. Its victims rebelled, but they were too weak for effective rebellion. Waterloo settled the fate of Europe, but it was Peterloo that symbolised the fate of England.

We have lived ever since in this atmosphere in greater or less degree. True, we have taken a more enlightened view of the conditions that are favourable to production. We are revolted by the more extreme form in which our ancestors sacrificed life to profit, but our gods have been much the same. We see an example in the spirit in which even so modest a demand as that which Mr. Fisher is making on behalf of the

children of the working class is opposed and discussed in certain circles. The greatness of England depends on the cotton industry; the cotton industry depends on the long hours of children; therefore, we cannot afford to let these children have some of the daylight for their games or their books. A few years ago there was a Committee appointed to consider the employment of boys and girls at night, and some moderate reforms were recommended, reforms that have not yet been put into effect. What was the argument against forbidding this practice? It was urged that the night labour of young boys and girls was necessary in certain industries because otherwise those industries would be at a disadvantage in competition with their rivals on the Continent. We still apply the same criticism; material wealth is the final standard and the Board of Trade figures pronounce the verdict on our civilization. And this standard is not applied by one class only. It is applied often enough by men as well as by masters, by working class parents as well as by capitalist employers.

Rediscovery of Power

If construction is to mean any real vital rediscovery of power it will mean that we have found a new outlook, a new standard, a new conception of the purpose of all our toil and effort. That standard will be the scope that our institutions provide for the good life. We can appreciate the difference from this passage in "Cobbett's Rural Rides."

Mr. Curwen in his hints on agriculture observes that he saw, somewhere in Norfolk, I believe it was, two hundred farmers worth from £5,000 to £10,000 each; and exclaims "What a glorious sight." In commenting on this passage in the Register, in the year 1810, I observed "Mr. Curwen only saw the outside of the sepulchre; if he had seen the two or three thousand half starved labourers of these two hundred farmers, and the five or six thousand ragged wives and children of those labourers, if the farmers had brought those with them, the sight would not have been so glorious."

Cobbett was discussing the change that had come over the country in his lifetime, when three farms had been turned into one and the old type of small farmer had disappeared together with the commoners and cottagers. If you take the one standard you can represent the changes of that time as a great advance in agriculture; if you take the other they mark a deplorable catastrophe. In the one case you think of agriculture as a purely industrial process; in the other you think of it as a system of life. The farmers of 1830 were much more substantial men than the farmers of 1730; they made larger profits and their methods were more advanced. But of the persons actually engaged in agriculture, three out of four were in a much worse case in 1830 than in 1730; poorer, less happy and most essential of all, less free.

If we want to decide how we are going to look at the future of our society, we can imagine ourselves in the position of a returning soldier. What is it that is being dinned into his ears? Production; production; production. What is to be our output? How are we going to stand against our trade rivals? More energy, more drive, more concentration, these, it is urged, are the key to success and progress and expansion. We are to introduce scientific management and conquer the old world by the methods of the new. The returning soldier is to fit himself into this. He is to pass from one warfare to another; from the warfare of the trenches to the warfare of the workshop.

Does this offer what he wants?

The war has shaken some millions of men out of the state of mind in which they accept the world as they find it. This means that a state of things which they suffered with the patience on which, as Anatole France has said, society ultimately depends will now be unendurable. Let us suppose that Sears, now a private in the Oxford and Bucks Light Infantry, was formerly an agricultural labourer, earning, say, fifteen shillings a week, working long hours with no Saturday afternoon, living in a tumble-down cottage which belonged to his employer, in a village with no kind of amusement or recreation; or that Garnett, now a Corporal in the Manchesters, was working in a factory, hot, ill ventilated, with no opportunity of exercising his lungs and his limbs in the open air, his home in one of a great series of monotonous streets; or that Kirkland, now a driver in the Lowland Artillery was a Glasgow carter, whose whole life seemed to be spent in steering heavy loads along dark and slippery streets amid angry traffic. In the course of the great strikes of the summer of 1911, it came out that the carters employed by one railway company were not entitled to any holiday until they had served ten years with the company. During the summer in which the war broke out labourers were on strike in the Norfolk villages for a half holiday once a week.

These men return from the front. Is Sears going to be told that he is to work harder and more incessantly for the farmer, or Garnett that the factory is going to rattle more harshly

than ever about his ears, or Kirkland that he is to drive his load later into the drizzling night?

This is not what the soldier understands by reconstruction. For the way in which a man spends his life, which seemed so unimportant to the economist, seems to a man who has been three years in the trenches more important than anything else. Why is it that there is so much less panic than tedium on the fighting front unless the dread of death is a motive less powerful than the dread of a dreary life? The old analysis made the desire of profit the one unfailing motive alike in capitalist and in workman, for industrial life was looked upon as a kind of goldfield in which men accept horrible conditions for the moment because they hope to become rich. It is not difficult to understand this view of life when we recall the days of the early industrial revolution, for they were days in which men with enterprise and a little luck sprang quickly into prosperity and power from small beginnings.

The description of the kind of life that the early employers led shows that they acted on the motive which some of the economists attributed to all mankind. So they acted themselves and so they believed the whole world acted. Many of the opponents of Factory Legislation were quite honestly of the opinion that the life which seemed so terrible was more eligible than any other life that offered itself to the boy or girl in Lancashire or Yorkshire factories because it provided a means whereby some of them sought advance to a prosperous career. We get the other side in the evidence that some of these children gave when they had grown up before the Factory Commissioners. Here is a vivid description from one of them, "Thinks they are no much better than the Israelites in Egypt and their life is no pleasure to them." This answer is an excellent summary of the impression that the factory hours made on the victims. We have continued to believe that the desire of gain is the one constant motive in men's lives, and there is still a sort of legendary view that the sacrifices a man makes in order to become rich are a noble form of asceticism. But even if it were true that all effort in the workshop is rewarded by riches sooner or later, this analysis would give a very imperfect account of the springs and motives of human conduct.

A Growing Revolt

It is sometimes argued that the ponies taken from the free air on Dartmoor for the coal-mines of the north are really happier for the change, because though they lose their freedom they are better fed, and the standard of good life for a pony is set by the manger. It is unfortunate that the days when a traveller in Thessaly could be changed into an ass with four legs are over, for there is no Lucius Apuleius to tell us how a pony feels. At present we have no evidence on the point that can be called first hand. It may be that those of us who think sadly of this change as we watch the gambols of the ponies round those bleak stretches of the moor where English gunners learn to blow German pill-boxes to pieces are wasting our sympathy. But for men and women, at any rate, it matters supremely how they spend their lives, and the growing sense of the quality of life, the growing revolt against the sacrifice of life to gain, however plausibly it is disguised, marks the progress of civilization, the advance of the human mind to a finer ideal for society, the escape from the moral avalanche of the Industrial Revolution.

This sense has been immensely strengthened by the war. The man who thinks about his future in the face of death does not think of the riches he is going to acquire if he survives, he thinks of the happiness he is going to find in life. Not of course that he despises riches but he values them not as symbols of success but as a means to the kind of life that he desires. And when he thinks of his country he does not think of the iron or the cotton or the wool with which it is to flood the markets of the world. He resolves that its life and its power shall be devoted to repairing the moral ruin of the world and to securing to men and women a new freedom and a better kind of life. This will be the spirit of reconstruction. A society living in this spirit will not prefer idleness to work, but it will work in a new and more bracing atmosphere than the old reluctant atmosphere of discipline. The pleasure of self-respect, or the pain and damage that come from the loss of self-respect, so intimately associated with work, is an all important element in human life, and this new ideal will demand that in this department as in others, and man's life shall be a pleasure to him.

What is it that men and women need in order to make the most of their lives? What are the conditions of human freedom and happiness and development? And how best can society secure those conditions to every class and every citizen? We shall start from that principle, and to men who ask us to think first of industrial power or military power or political power, we shall reply that it is the first duty of a civilized state to see that no man's life is wasted.

Shopping in Eastern Ports

By William McFee

Salonika.

I HAVE not given up all hope yet. I do believe still in that far-off, divine event, a letter. Of course I know the times are out of joint, but that should not entirely preclude a scrape of the pen. I myself have had no writing paper for a week. This is a new writing block just out from England. My mother makes raids on the Stores and sends me out some at intervals. For a hundred sheets like this the camarilla of Port Said want half-a-crown. So I do no business with them.

They are a curious crowd, the retailers of a place like Port Said or Salonika in war time, and repay study. They are retiring. They do not advertise save the world-famous Orosdi-Back of Egypt and Macedonia, known to the British soldier as No-money Back, which is indeed the truth. Orosdi-Back describes himself as "the Whiteley of Salonika." No doubt. You approach his "Long" as the Chinamen say, by diving down a precipitous back street like a muddy drain. He sells everything, at a price, from bathing costumes to bell-shaped mosquito nets, trousers, footballs, hair-clippers, fountain-pens, ice-cream machines, fruit essences, fly-traps, razors and Ford accessories. Perhaps he arrogates to himself the title of Whiteley with some reason; but for all that the British soldier regards him with bitterness and contempt.

Whiteleyship of the Levant

I do not deal with the gentleman myself. I cannot get over his name. Or rather I cannot place it. At one time I imagined it was a phonetic rendering of a North-British patronymic. Perish the thought! Or how do I know he is not at heart an enemy of my country, this Orosdi-Back? There was Stein's Oriental Stores, also competing for the Whiteleyship of the Levant. For years on and off I dealt with Stein in Alexandria. Stein's was the only Department Stores east of Genoa! About six months ago Stein's was sold in London as an enemy firm and is now Somebody Else's Oriental Stores. After two years! No matter. What I was going to say was—Stein's used to be cheap. You could get a suit of pyjamas (Egyptian cotton) for five shillings. But when I was there in the spring Stein's was terribly dear and poor in quality. There was not the same *zip* about the cash-girls and the lift attendants. Stocks were depleted. Nobody seemed to care. I was disillusioned. Yet all I had to do was to walk up the street to another shop and do business with a competitor.

But in Port Said or Salonika I can't do that. There are no competitors. It reminds me of the small town in the United States, where every store is supplied with the same articles by the same giant Trusts and where the cowed dummy shop-keeper does not care whether you come or go. Of course I look at it from the passionate standpoint of the purchaser. I feel all the time I am being robbed. When a pair of grass-slippers costing 2d. a pair in peace time runs up to 10d., I cannot find words to express my emotion. When a fountain pen costing 12s. 6d. in Alexandria, costs me a sovereign in Port Said, I pay because if I don't write I go crazy, but I have murder in my heart. But the shop-keeper is not disturbed. He cares not whether I buy or go away. Pay or do without, he says in effect. What is the consequence? We all have everything possible sent out. I reckon that out of the innumerable vessels visiting Port Said in the year only a fraction per cent. of possible business goes to the pirates of Port Said. Who is going to pay 100 per cent. more than the published price for a battered fly-specked cockroach-gnawed copy of a book one can have sent out from London, clean and sweet, for 5s. Who would pay 3s. 6d. for cotton abominations which are labelled "socks" while there is a single honest hosier's shop open in England? I put this to the Port Said pirate sometimes, as man to man, but he smokes his eternal cigarettes and is not impressed. I put it to the wretch who charged me 6½d. for a small *Aquila de Oro* by Bock, a smoke which I used to get (full size) for six cents in Havana. He elevated his shoulders and turned away. Have these people by any chance a point of view of their own? They have.

Their point of view is that they are losing money! I admit it sounds incredible, for "they" include Greeks, Maltese, Armenians, Italo-Arabians, German-Jews (nationalised of course) Franco-Albanians and straight Hindoos. The world is indeed in its last cataclysm if these gentry are losing money. But in conversation with a gentleman, as the newspapers say, "in a position to have authentic information," I was apprised of the truly colossal demands made upon the importer. I do not pretend to know the ins and outs of fiscal matters,

and I may summarise it by telling you that when the cosmopolitan merchant in Egypt has paid all the insurance premia, and excess profits taxes and import duties and the terrifying freight which a patriotic British shipowner levies on the hapless creature, he *must* levy an extortionate price in retail. Add to this he is expected to contribute to the support of refugees, of canteens and institutes. He is also expected to smile when those same refugees start making carpets and mats and embroidery (some of which I am sending you) and so undercutting him scandalously in trade! You see, there is always a point of view, if you only look at it. But do not imagine Messrs. Greckopoulos and Co. or Sandberg and Rascalla or So-and-So's Levantine Stores are losing money. They are not built that way. And in war time there are more ways of making money than merely selling gimcracks over a counter. I imagine all sorts of things. I see an abstracted expression on many of their faces. Things are going on. Money is spent like water in the *café-chantants* round the corner from the Continental, and the Eastern Exchange. Mysterious money! Gentlemen with ridiculously small salaries fare sumptuously every day. They buy *Aquila de Oros* by the box!

And in every war, from Pharaoh's time down to the present day, it has been the same.

I am writing this on watch before breakfast, for I am going ashore presently, writing with all the noise of discharging going on, machines working, winches rattling, stewards pestering, and an air-raid up above, crowning all as you may say. I no longer stand gazing into the empyrean blue. A soldier the other day showed me a piece of shrapnel which had come down near him. I have worked out, allowing for air-friction, the exact speed at which that fragment, falling from a height of ten thousand feet, would strike my head. Even neglecting the explosive energy imparted to it by the charge, it is an impressive figure. I remain indoors, for I am not of the stuff of which heroes are made. I suppose it is because I was born a civilian and will probably die in that persuasion, but I would not run a ha'porth of that sort of risk for all the ribbons on the tunic of a commander-in-chief. I don't care a snap for Sir Oliver Lodge's astonishing discoveries about the spirit world. This, in the vernacular of the day, is *the life*. As a shipmate of mine said when I chaffed him for being restless at night about submarines, "Dammit, I want to *live*. I want to see the end of the war." My sentiments exactly, so, as I said, I stop indoors during air-raids.

That, however, is by the way. If you wish to think of me as a hero, pray do. I am "writing under fire," as the newspapers say of some particularly bad minor poet who is at the front, and whose wife spends her time pestering editors to boost him now and again. Yes, I am writing under fire. *Boom* go the bombs; *Bang* reply the guns all round. I am beginning to think that, like Molière's immortal character, I have been behaving like a hero all my life and did not know it.

Tommy

But let me introduce you to my shipmate the engineer on night-duty. Never mind his name; it has a hard Northern tang, like his speech. We call him Temmy. He and I are old friends. We were shipmates on the *Mumbo-Jumbo* in the old days. He came out to us overland together with the rest of the fresh crowd. I don't suppose he will ever make a noise in the world, but to my mind he is a very gallant young gentleman. It was rather amusing to hear Tommy trying to put into words his impressions of his five days in Paris waiting to be forwarded. Imagine it! But you cannot, for you do not know his type.

It is a type of which the public in England is almost entirely ignorant—I mean of a young mechanic from a comfortable middle-class home, often of yeoman ancestry, who has served his apprenticeship in a big, busy, undermanned works and then gone straight to sea. Tommy has had that entrancing experience. While serving his time he could never be sure of an evening or a Saturday afternoon. And his employers belonged to the old Mancunian breed, the breed that reckon they can pay a lad for his immortal youth at so much an hour overtime, the breed that recognise no duty to the young beyond the factory-inspector's demand. The result was that when he went to sea he had had no real youth-time at all. Only work. He had no social life, no sport, no comprehension. He had been apprenticed not to life, but to engineering. And he went to sea.

Now going to sea is all very fine in its way, but it is not conducive to broadening a youth's culture if it consists

exclusively of watch-keeping and field-days. Going to sea is not the rapturously romantic existence many people imagine it to be if you are, as Tommy was, a junior in the red-hot engine-room of a ship that goes full speed to South America for fruit, spends twelve hours loading in a port consisting of three sheds, a wireless station and a railway office, and then returns at full speed to England. Kipling's graphic picture of youth ashore in tropic climes in "Macandrew's Prayer":

In port—we used no cargo steam—I'd dander doon the streets
An' idiot grinnin' in a dream, wi' shells an' parakeets,
An' walkin' sticks o' carved bamboo, an' blow-fish stuffed
an' dried

Fillin' me bunk wi' rubbishry the Chief put over side,

's very pretty and very clever and no doubt very true of the old eight-knot cargo-wallah of twenty-five years ago. But England does not get her bananas that way, let me tell you, and when I quoted these lines to Tommy, he smiled a rather cynical smile. He had had five years of a very different experience.

But I was going to tell you about what eventually happened to him not long before coming out to us in Alexandria. After I left the *Mumbo Jumbo* Tommy went to the *Lilliebulero* as Third. He had no certificate, because one of the delights of being in ships with many juniors is that you cannot qualify for years. Progress for Tommy had been slow. Appearances, too, are against him, for he is very small, and no more resembles the marine engineer of fiction than you resemble the lady novelist of fiction. He does not use filthy language, he does not brain firemen with iron bars, nor does he use a jargon that no man except Rudyard Kipling ever understood. He is a human being, which is why I am writing to you about him. And he went Third of the *Lilliebulero* which means he wears two stripes of gold lace on his sleeve, three-eighths wide, with three-eighths of purple-silk between. On watch he wears, like all the rest of us, a pair of cotton ducks and a cotton singlet.

The Place Where the Elephants Die

By Owen Letcher

This is an incident of the Central African Campaign.

WE found Strayne lying alongside the Mahenge pathway in a pool of his own blood. At first we did not recognise him, so blanched was his face. His beard had grown, his uniform was torn and ragged, and his legs were black with the ash of burnt grass. Altogether it was difficult to believe that this was Strayne, in peace-time a famous elephant hunter, and in war the dapper Intelligence Officer of the Eastern Column.

It only required a moment's scrutiny to make it clear that Strayne was approaching the end of his last "safari."* He had two ghastly wounds—one just above the heart and the other through his right thigh. They had evidently been made by the wicked 11 millimetre soft lead bullets used by the German Askari in the Central and East African campaigns.

Death stared at us out of his eyes which seemed to burn like hot coals far away back in his head. But we did what we could for him. The column doctor was on the scene almost immediately and a machilla soon came doubling up from the rear.

"Why, good God, it's Strayne!" ejaculated the Adjutant and the Doctor together.

"Wonder where he's been," muttered the Adjutant. "Wonder what information he's got. It's ten days since he left us to try and find out what Brauermann's strength was."

The Doctor looked up quickly from the well-nigh lifeless form that lay in the stretcher. "I don't think Strayne will ever make any more intelligence reports—not in this world," said he.

Strayne died that evening, and perhaps because I am a sentimental soldier and not a warrior of business, he made a supreme effort and spoke a few words to me before he crossed the great divide. Then for the first time did I become aware of the existence of a Mrs. Strayne. We had all put Strayne down as a bachelor, although we had no real cause for doing so. He was a man not given to talk; in many ways he was a vast human mystery.

"I want you—to see that my wife is looked after, Maudsley," he said with a tedious despair in his voice. "I fairly—worship her. I left home for her sake—and—when-ever I've bagged a good Jumbo it's been halves partner with the tusks."

The Doctor came silently into the hut but Strayne motioned him away, and I held up a finger and shook my head. "There's something I want to tell you, Maudsley," he continued, and

With her full cargo of fifty thousand bunches of bananas the *Lilliebulero* was homeward bound, when three thousand miles from home, a singular thing happened. What was not singular was that it occurred on the Third's watch—twelve to four in the morning. Singular things were always happening on my own watch when I was Third. This thing happened on the *Lilliebulero* at 3.30 a.m., just as Tommy had gone into the stokehold to attend to the feed-checks. He was doing this, noting the water-level in the gauge-glasses, and seeing there was plenty of good large coal for cleaning fires at eight bells when he heard a terrific uproar in the engine-room, a noise as though the main engines had broken loose from their foundations and were trying to kick their way out.

Dashing in between the after-boilers he opened the double dust-proof door into the engine-room and was greeted with clouds of live steam, and the most appalling racket, in all probability, he had ever listened to. For the high-pressure engine had broken her cylinder bottom. And she was racing up and down and scattering destruction in all directions. The patent metallic packing, which is a round iron box full of spring and anti-friction blocks and plates and distance-pieces, had burst like a shrapnel shell and was sending fragments flying everywhere.

Tommy rushed through the steam, which is very unpleasant in its own way, and found the throttle-handle. He got several pieces about the head and shoulders, but he got the throttle shut and the main engines were pulled up in twenty seconds after the smash. It was ten minutes before the other engineer could get down below and carry an unconscious and parboiled Tommy into fresh air.

That is why I call him a very gallant young gentleman. Of course it was appreciated, for he saved the ship and cargo, and even shipowners are human beings, though to hear some newspaper talk you would imagine them to be incarnate fiends. It was very handsomely appreciated; but he ought to have had the D.S.O. for all that. Don't you think so?

his voice died away almost to a whisper as the Doctor crept out of the hut.

"Let's hear it, Strayne. I'll promise I'll do what I can." He gave me a look of great gratitude and weakly clasped my hand. When he spoke again his voice was so faint that I had to bend closely over him to catch the whispered words.

"I want you to sell nine thousand tusks of ivory for me and send the money home as soon as this show is over."

"Nine thousand tusks!" I ejaculated. "Why old thing it means a fortune!"

"About a quarter of a million I reckon," whispered Strayne. "It ought to set up my wife for the rest of her life."

I was silent, for it had suddenly dawned on me that Strayne had probably taken leave of his senses.

"Where are they?" I asked with a view to humouring him.

"It's the place where the elephants die," said Strayne.

"The place where the elephants die!" where had I heard that expression before? There was a curiously familiar ring about the words, but for the life of me I could not place them at the moment.

"I went there once," said Strayne. "and had an exciting time of it. You'll have to be careful, but you can do it all right. God! What a sight it is. It's only a few days from here, between the Mufinga and Musutu Ranges—down—in—a—deep—deep—valley—map in my—field—service note book."

I tried to catch the rest, but the whisper subsided into a hushed gurgle, and a minute later Strayne died in my arms.

We buried him the following day beneath a great baobab tree, under the African foothills that he loved so well. The bugles blared out the impressive notes of the "Last Post," and then we tramped sorrowfully away. It seemed to me those clarion calls had awakened a thousand echoes in the grim old mountains, and as I wended my way back to camp they kept repeating in my ears: "The place where the elephants die!" "The place where the elephants die!"

Here was poor Strayne—a veritable elephant among men (he stood 6 feet 4 in his socks) dead—and with him perhaps his secret. But I had promised to do what I could. Then it all came suddenly back to me. I had heard those words: "The place where the elephants die" on two previous occasions.

The first time was at Karonga before our advance began. I had heard them there, used by old Nicholson, who was a quaint old fossil of a trader—who had wandered all over Africa from Fernando Po to Chinde, and who had accumu-

* Journey.

lated a most wonderful fund of native folk-lore, fables and traditions.

The Adjutant was with me at the time, and we had questioned Nicholson about this supposed mausoleum of the mammoths.

"Well," said he, "I don't know whether there's much in it or not, but that's the native yarn all over Africa. They say that elephants always go to one place to die. It's a vast sort of Jumbo cemetery, I suppose. The yarn of the niggers is that this graveyard is somewhere up North, and that only two or three men have ever seen it and then only at great risk of their lives, because the place is held sacred by the elephant clan, and the animals are sworn to kill all intruders."

The Adjutant laughed: "That's a good fairy tale, Nicholson," said he. The old man looked serious. "Well, p'raps, p'raps it is. But it's strange I've never met anybody yet who ever saw a dead elephant."

On the second occasion I had heard Strayne himself employ these queer words. I recollected that just after the advance started we had been talking of record ivory tusks one evening. The Adjutant after awhile, appealed to Strayne on the subject and the Elephant-Hunter-Intelligence-Officer had replied: "The biggest tusks I ever saw were in the place where the elephants die. There were two of them that beat that pair got by Powell-Cotton in the Lado by feet."

"Where did you see them?" interjected the Adjutant sharply.

"Oh! it's a long way off," replied Strayne carelessly; "and it's not a healthy place for white men. I went there once and I was very thankful to get out of the place alive."

"More travellers' tales," laughed the Adjutant. "Tell us about it anyway, Strayne." But Strayne changed the subject and we could never get him back to it again. The next day I hunted diligently for Strayne's note-book. But it was nowhere to be found, and I came to the conclusion he had lost it in his last adventure.

A few days afterwards we continued our advance to the north-east after the retreating Huns and for a time, at any rate, the incident dropped out of my mind altogether.

About a week after Strayne's death we found ourselves help up by a strong German rearguard. They held the crests of a high range of hills, and, with four Maxims in well-chosen and carefully-concealed positions, they made things very warm indeed for us. One morning before proceeding on a reconnoitring patrol, I was poring over my maps when I noticed that the high ridge before us was termed the Musutu and that beyond that range of hills was a second ridge marked as the Mufinga Mountains. In the hurly-burly of warfare Strayne and his dying message had been out of my mind for awhile, but when I saw these words on the map I remembered that they were the names employed by Strayne to denote the locality of the place where the elephants die.

That day I found the enemy in retreat, and helioed the news back to the Main Force. Shortly afterwards I received an order to co-operate with another small column that was making a big sweeping movement to the north-east with a view to "scuppering" the German rear-guard. So I pushed my company rapidly forwards and soon gained the crest of the hills marked "Musutu" on the map. Native scouts found the spoor of the German rear-guard going downwards from this range into an enormously deep valley flanked on the northern side by another high range, which I took to be the Mufinga Mountains. I had my orders to carry out and so I pressed my pursuit down into this deep declivity between the ranges, and as I went I wondered whether Strayne's weird story was true and whether down here in this deep cleft in the earth was in reality the great Elephant mausoleum, of which Strayne and old Nicholson had spoken.

In the late afternoon we reached a round deep cup-shaped depression; a kind of subsidiary declivity in the main valley. It was two or three miles wide. The sides were densely bushed, and far away down in the depths I could espay tall trees. Had the retiring Germans hidden themselves down in this vast hollow? It looked as if they had, for about 5 o'clock a native runner dashed up to me with a message from the other column stating that they had cut off the Germans from their line of retreat, but that nothing whatever was to be seen of the rear-guard—was I in touch with them? I had scarcely sent off a reply when a fierce rattle of musketry broke out from the depths below.

"Who on earth can be scrapping down there?" said I to Foxgrove, my senior Sub.

"Can't make it out at all, skipper" quoth he. "What are the orders now, Sir?"

"Well, I'm going to halt here and investigate," said I. "Good God, what's that?"

From the abysmal depths below us broke out a terrifying trumpeting roar as though a million massive fog-horns were blowing concerted blasts. Then the rattle of musketry broke out afresh, and this time it was accentuated by the

rat-tat-tat-tat of Maxims. We listened in amazement. As the African sun sank—a globe of crimson splendour—in the west, the firing died away, but the terrible trumpeting noise increased in its furious intensity. Presently a deep and awe inspiring silence fell upon this pit of terrors, but now and then we could hear a faint and scarcely audible moan coming to us from the depths. The night came rushing over us and found Foxgrove and I still standing on the edge of the chasm.

"There's something uncanny about this, Foxgrove," said I presently. "There may be something in Strayne's story after all."

"What's that, skipper!" asked Foxgrove.

"Oh! Nothing much," I replied. "But I think you and I'll go down and investigate when the moon gets up."

The moon rose full and mellow a little later. I called for volunteers amongst the Native Scouts to accompany Foxgrove and myself on our adventure. These natives were extraordinarily plucky fellows. Time after time they had led us right on to an enemy piquet or scouted a hostile position in broad daylight. But they absolutely refused to go down into the hollow. "It is the place of the 'N' Jofu* Bwana,' remarked their leader," and no man who goes there will live. We will die fighting for you, master, whenever you wish. But we will not disturb the elephant folk."

I had learned to respect native traditions and customs, and so Foxgrove and I started on our descent alone. As we clambered down into the gorge Strayne's words kept ringing through my ears, and I felt that strange as his tale had seemed we were nevertheless on the brink of its reality. We must have climbed down quite 3,000 feet, I should think, when we felt our feet touch a soft spongy carpet of moss. We had reached the bottom.

In the uncertain light we could see an open glade running through a forest of very tall trees. The glade was full of what at first sight appeared to be masses of gleaming white boulders. But as we advanced carefully along we made the startling discovery that these boulders were in reality pile upon pile of gigantic bones and tusks of ivory of all ages and sizes—pure white and rotten yellow, small and large.

Stranger still was it to find corpses of Germans, White and Askari, rifles and equipment lying huddled together in this mammoth graveyard. Most of these corpses were mutilated beyond recognition. Some of the bodies were stamped right into the soft mossy ground underfoot. Others had heads or limbs torn from their trunks, and others appeared to have been smashed to pulp on the bones of the dead animals. We found a machine gun crushed flat like a piece of sheet iron. Here and there too were dark mammoth shapes—the dead heroes of the elephant folk who had fallen in defence of their sanctuary that afternoon.

I felt my flesh creep as I surveyed that weird and terrible scene. In the moonlight the forms of the dead men and animals looked spectral and ghostly. This was the place Strayne had spoken of.

"A quarter of a million in ivory." I could well believe him.

Neither of us spoke a word. There seemed to be something about that scene, something non-human and unbelievable and terrible that absolutely silenced speech. We just gazed on it in awed astonishment. But our survey was not long. Suddenly a noise like the rush of many waters broke the silence of the place of death. At first it seemed a long way off. But we could hear it rushing along like the noise of a forest fire. And—like a forest fire it brought an immense sound of falling trees in its train.

"Run for your life, Foxgrove," I yelled. We both bolted for the cliff sides and started clambering up like madmen. Before we had climbed a hundred feet a mighty roar seemed to fairly shake the ground on which we hung. We went up the sides of that cliff like men possessed of devils' strength. Once, when about half-way from the top, we glanced backwards and in the moonlight saw the giant ghosts moving quickly here and there amongst the piles of bleached bones and the heaped up German dead. We reached the top breathless and terrified. The natives accepted our story with a grave silence. But very few of the whites on our column credited it.

When we joined up with the main body again the Colonel and the Adjutant absolutely laughed at us, and the "Clan Man" told the doctor to keep us under observation. Yet they were all vastly mystified as to the fate of the German rear-guard—the enemy forces that seemed to have been spirited away.

The sudden disappearance of Brauermann's rear-guard remains one of the mysteries of the Central African Campaign to everybody except Foxgrove and myself, and the natives, and Strayne's ivory remains there in that Valley of Death—a piled up accumulation of treasure guarded by the elephant folk.

*Elephant.

Life and Letters

By J. C. Squire

Secret History

"WE are the people of England who never have spoken yet," is the refrain of one of Mr. Chesterton's old songs, and the thesis of his *Short History of England* (Chatto and Windus, 5s. net), which may be destined to be the most useful of his many useful books. Mr. Chesterton does not pretend to be a scholar, and he would probably not be surprised if he were told that there were numbers of inaccuracies in his book and numbers of important qualifications out of it. He will go a little too far sometimes for an antithesis, a joke, or a climax; and at some places in his history the learned may say, "This is all wrong." But what matters is that the general motive and arguments are all right. Mr. Chesterton has a knowledge of human nature, a love of his countrymen, a belief in democracy, and, in spite of his strong opinions, a regard for truth. These are not always among the virtues of historians, and they frequently lack the convictions that men are not born on the earth for nothing (that is, that life is worth living) and that the test of a civilization is the sort of life that the majority of its members live. Mr. Chesterton has those convictions and he refuses to accept the common delusion that a civilization of 1900 must be higher than a civilization of 1800, because 1900 is after 1800; he, on the whole, is compelled to plump for the brief zenith of the Middle Ages as the best period of a bad lot in the history of the English people. It is not sentimental mediævalism, and he is not blind either to the advantages we have over our mediæval ancestors or to the still greater advantages we might have if we only decided to regenerate our society instead of fatalistically submitting to the operation of "economic forces"—which are usually other words for the unbridled greed or undirected energy of individual men whom we are, if we only care to, at complete liberty to control, silence, lock up, or smite hip and thigh. He looks at the past with the eyes of a decent man who maintains that men have souls and that they should be treated like Christians; and by that test he judges what has and what has not been done.

* * * * *

Never losing sight of that he gallops at top speed through English history; he misses great spaces, but wherever his hoof touches it strikes out fire. Continually he tosses off a sentence, the product of a clear eye and an untainted heart, which will shatter the conventional reader's preconceptions. "The first half of English history," he says, "has been made quite unmeaning in the schools by the attempt to tell it without reference to that corporate Christendom in which it took part and pride." There is no need for commentary on this: it is simple truth. And it is equally true that we cannot understand the struggle between Henry II. and Becket unless we understand what the Church stood for as well as what the Plantagenet monarchy stood for. Becket did not lose favour and die merely in order that guilty clergymen should escape the proper reward of their crimes; and the situation cannot be rightly assessed unless we consider Henry's action in going to be flogged at Becket's tomb, and the popular reverence of Becket together with the legal struggle that preceded the tragedy. The early legends—all our heroes, he notes, are *anti-barbaric*—the Reformation, the Civil Wars and the Eighteenth Century are all treated, perhaps sketchily, but with a verisimilitude that convinces. At every point the orthodox narrators stand condemned; and everywhere they have failed to attempt to grasp the real mind of the masses of the people and even—if the period is distant enough—that of their governors. Nowhere is this more noticeable than in the common treatment of the Crusades. They were not fought for nothing. They were not fought for gain. They were not fought out of bigotry. There was good and evil mixed in them, but no wars in human history were fought for a better cause and none appealed more strongly to the souls of common men. No more, again, do our historians attempt to visualise the great buildings of the Middle Ages, and what was behind them: they merely say they are there and give the Middle Ages one good mark for them. Opinions such as these Mr. Chesterton maintains with his usual wit and his usual eloquence; his jokes are seldom forced in this book, and in many places he rises into noble passages of English prose. He lets out with immense good humour and effect at pedants of all sorts, especially anthropologists and Teuto-mongers; and he gives by the way character sketches, particularly two of Sir Thomas More and Richard III., which are both brilliant and plausible. And he drives home an obvious truth when he accuses us of magnify-

ing the defects of the Middle Ages by telescoping our chronicles. Certainly if a man were to write in eight pages a history of the last century, mentioning principally the wars and the sweating, he could make us out one of the lowest lots on record. And that without falling back upon the ugliness of our civilization and that mental plague which, as Mr. Chesterton observes, has left us worshipping in children all that we have crushed out in men.

* * * * *

The book is not a history. It is an historical essay. It covers two thousand years in three hundred pages, and the general propositions leave little room for the facts which might illustrate them. But it might well be used by a more laborious writer as the theoretical basis for a history on the grand scale. Every contention that Mr. Chesterton advances, every institution that he describes: every trend of sentiment that he detects, might be documented from ruins and records, charters and songs, traditions and laws. The "evidences" for such a work lie scattered in thousands of books, buildings and memories, not to speak of the minds of living men: the one place where you will never find them in large numbers is a formal history book. The manner of writing history has been subject to fashions. At first men compiled—and they were then, at least to some extent, in touch with humanity—very indiscriminating chronicles in which if battles received too much attention, at least they were battles and not merely episodes in economic development, and if legends received too generous an acceptance, at least there was no assumption that you could understand men's deeds without understanding their dreams. The scientific spirit grew and the development of institutions was given, quite properly, increased attention. The 1297 Parliament of Stow-in-the-Wold, the charter of Chudleigh, the refusal of the Hemp Subsidy, and other such incidents became landmarks with whole pages to themselves. Anxious to know how the British Constitution, in its widest sense, had reached its present condition, men catalogued ancient laws without really bothering about their origins and objects, and stared hard at ancient offices without visualising the men who occupied them. Political economy came into existence, and more was said about exports, imports, the mercantile theory, the discovery of the Mexican silver mines, the trading companies, and the Enclosures Acts. Finally, it became a commonplace amongst the enlightened that too little had been said about the "condition of the people" throughout history. Green wrote, with a laudable ambition, a work, the title of which recognised this. Paragraphs on the Black Death and the Peasants' Revolt began to be sprinkled with a few quotations from Langland; attempts were made at a systematic study of our forefathers' wages; and the excursus on the manners and pastimes of the multitude became common form. But whatever the narrative fashion of the age, and whatever the idiosyncrasies of particular historians, the real history of the English people remains to be written. There have been historians who have treated their subjects in a human way, and who have avoided quite openly the dry pseudo-scientific method. One wrote to celebrate the greatness of Tudor England; another to celebrate the triumphs of Whiggery. They were entitled to their opinions and their heroes: but of none of them was the hero the English people, and none of them were primarily concerned with the opinions, the emotions and the experiences of the English people. Our histories are all histories of the crust: if kings and aristocrats are not the only people who matter, then politicians and intellectuals are the only people who matter. The masses may be completely disregarded or they may be regarded with a measure, great or small, of sympathy: but when they are not forgotten they are, consciously or unconsciously, patronised, and openly or by implication denounced. Above all our history has been run in the interests of Industrialism, and where Progress has failed to be progressive historians have, often so naturally that they were unaware of it, blinded themselves to good things we have lost and the manner of our losing them. English history is, in effect, a whitewashing of the *fait accompli*.

* * * * *

Those are Mr. Chesterton's contentions, just as they were the contentions of Mr. Maurice Hewlett's fine agricultural epic *The Song of the Plow*, the history of which bears a close resemblance to Mr. Chesterton's. It doesn't matter whether he tells the whole truth or not; at any rate, he emphasises many truths commonly overlooked. And if he also has a log to roll it is, at any rate, a more important log than the others.

He, like Mr. Hewlett, ends with the war and the transfiguration of the common disinherited man, called upon at last to confront the nation which above all others had been praised by his professors and his politicians as a pioneer of civilisation.

He in whose honour all has been said and sung stirred, and stepped across the border of Belgium. Then were spread out before men's eyes all the beauties of his culture and all the benefits of his organisation; then we beheld under a lifting daybreak what light we had followed and after what image we had laboured to refashion ourselves. Nor in any story of mankind has the irony of God chosen the foolish things so catastrophically to confound the wise. For the common crowd of poor and ignorant Englishmen, because they only knew that they were Englishmen, burst through the filthy cobwebs of four hundred years and stood where their fathers stood when they knew that they were Christian men. The English poor, broken by every revolt, bullied by every fashion, long despoiled of property, and now being despoiled of liberty, entered history with a noise of trumpets, and turned themselves in two years into one of the iron armies of the world. And when the critic of politics and literature, feeling that this war is after all heroic, looks around him to find the hero, he can point to nothing but a mob.

This also the scientific materialist will call rhetoric, and look for his explanations elsewhere, not seeing, or blind to their beauty if he does see them, the multitudinous idealisms and loves and loyalties in the host of inarticulate breasts whose only speech is action—and a misleading jest. But there is truth in the rhetoric, and the truth will be told about no large movement of humanity unless the imagination and the emotions are brought to bear upon the facts. Wat Tyler's followers, usually described as "a peasantry resentful of an unjust poll-tax," cannot be comprehended by that phrase; a whole novel would not be too long to display the confused minds of those resentful and then briefly, exhilarated men who, though illiterate and not capable no doubt of formulating a system which would establish and secure what they wanted, had a Utopia of a sort in their hearts and knew what they immediately wanted, and that in justice they should have it, and were prepared to risk their lives that their class might have it. Mr. Chesterton's short passage on the Pilgrimage of Grace, lets far more light in on the state of mind behind that rebellion than any amount of "facts" about it backed by lifeless references to "those whose sympathies still clung to the old regime." But one might come nearer. I happen to remember the 1906 election and the campaign in the rural constituencies of which I saw a good deal. A great and successful appeal was made to the agricultural labourer. The outcome of it was a largely unworkable and unworked Small Holdings Act. The Act will get a few lines in the histories: the appeal will probably get none at all. Moreover few, even of the men who made that appeal, and dangled before the labourer the realisation of his age-long hope of work in liberty with a proper reward on the land which is in his bones, exercised their imaginations sufficiently to realise what the promise and the disappointment meant to him. For he does not write books, he is slow of speech, he can only vote, after all, for one side or the other, and—in the end—centuries of frustration have made him resigned, and he is quite prepared, as often as necessary, to submerge his useless aspirations in a pint of beer. If the history of England still remains unwritten Mr. Chesterton's book will teach the next generation of historians their business.

Books of the Week

A Literary Pilgrim in England. By Edward Thomas (Methuen, 7s. 6d. net.)

Tommy's Tunes. By 2nd Lieutenant F. T. Nettleingham, R.F.C. (Erskine Macdonald, 2s. 6d. net)

NEVER has there lived a more devout lover of England than Edward Thomas, that shy man of letters who, putting behind him all that had hitherto attached him most closely to life, joined the Royal Regiment of Artillery and gave his life for England. His greatest joy was to wander about the country-side with a friend—one of those rare companions with whom a man communes more in silence than in speech. To recline upon a Wiltshire down on a summer day and watch the play of sun and shadow, of breeze and cloud, was to him exquisite pleasure. This sense of happiness finds reflection in these essays on men of letters. But it is a work that suggests a weakness in the character of Edward Thomas. Diffident of his own powers, he turned to others for that expression which, in truth, he was perfectly adequate himself to utter. And one cannot help feeling passing regret that he did not in his brief life read less and write more. These few words, from his essay on Meredith, may be said to define his own attitude.

Nature to him was not merely a cause of sensuous pleasure, nor on the other hand an inhuman enchantress; neither was she both together. When he spoke of earth, he meant more

than most men who speak of God. He meant that power which in the open air, in poetry, in the company of noble men and women, prompted, strengthened, and could fulfil the desire of a man to make himself, not a transitory member of a parochial species, but a citizen of the earth.

The truth enshrined here has been made manifest in the finest poetry uttered by our fighting men during the war.

* * * * *

The title is a bad one. A pilgrim is one mainly concerned with the object of his journeying, not with the incidents surrounding it. It is one of those curious silences in the English language, as it were a dumb note on the key-board of our speech, that we have no one word to denote a human being who uses his own muscles to explore the glories and mysteries of the earth's surface. To speak of such a one as a tramp connotes dirt and vermin, a pedestrian is impossibly horrible, perhaps a wayfarer comes nearer the mark, but hints at dust and highways, and so it would have been better, had this title not attempted an accurate description but had followed the example of Borrow, with *The Bible in Spain*, and left to the imagination of the reader its true import. The book itself is a series of essays on literary men, mostly poets, living and dead, who had shown special interest in Nature. How varied is its character may be judged from the fact that it includes William Blake, Shelley, Tennyson, John Clare, Matthew Arnold, Keats, Meredith, also Thomas Hardy, W. H. Hudson and Hilaire Belloc.

* * * * *

Belloc was evidently Thomas's favourite living writer; his essay on him is the most intimate in the book. Nor does he hesitate to chasten him mildly even while he praises. "He (Belloc) is just too much concerned with what England has been and may be again . . . to leave us quite a clear vision of England as he has known it." Not a bad fault, seeing it arises from the faith that earth was made for man, not man for earth. Thomas quotes these pregnant sentences of Belloc, "The love of England has in it the love of landscapes as has the love of no other country; it has in it as the love of no other country, the love of friends." Most true, but one who has found this same love of landscape and of friends in lands other than England questions whether it arises from England herself but is not rather due to a deeper cause. This reviewer attributes it to the Authorised Version of the Bible. It is through the poetry of the English Bible that Englishmen's eyes and hearts have been opened to the soul of earth. Take the 23rd Psalm, easily the best known and most popular poem in our tongue. For the dullest brain that has once mastered it, the least meadow ever afterwards is touched by the light of heaven. Belloc is indubitably right when he attributes to Englishmen a deeper love of Nature than to men of other countries; but one who has recognised this truth and in exile sought to probe it, has always found beneath this deep devotion early delight in the rhythm and the Nature pictures that abound in the Bible. We should like to have seen this discussed by Edward Thomas in this volume, to which all lovers of England will turn with gratitude.

* * * * *

It is possible that in course of time books may be made over the already disputed place of *Tipperary* as the marching song of The Old Contemptibles. There are soldiers who declare its position in the popular mind is justified by facts; others assert it was fictitious, accidental, Press-created. Of such is Lieutenant Nettleingham who in *Tommy's Tunes* derides *Tipperary* as a marching song, and declares that *Annie Laurie* and *Home Sweet Home* have from first to last been most popular songs in the British Army on active service. It is a big score for the Early Victorians. This little volume is a really valuable collection and will no doubt be added to and amplified as time goes on. Would that we knew equally well what our soldiers sang in Flanders in my Uncle Toby's days, or again when they crossed the Pyrenees under Wellington, for no doubt they sang as well as swore. Certain ballads and tunes seem to be endowed with immortality. Sullivan's "Onward Christian Soldiers" is an example of the latter; any doggerel is good enough to carry its swinging music; and of the former there is no better example than *The Dying Lancer*. Where did it originate? There is not a spot on earth where the English tongue has spoken which has not listened to its mournful tones. And now the Royal Flying Corps has adapted it and the new version echoes the splendid spirit of that gallant band of brothers. This is how it runs,

A handsome young airman lay dying (Chorus: Lay dying);
And as on the aer'drome he lay (he lay),
To the mechanics who round him came sighing (came sighing)
These last dying words he did say (he did say):
"Take the cylinder out of my kidneys (of his kidneys),
The connecting rod out of my brain (of his brain),
The cam box from under my backbone (his backbone),
And assemble the engine again (again)."

In Command

By "BLACK WATCH."

War has its virtues no less than peace—whatever anti-militarists may say. The present war, in particular, has been wonderfully productive in the direction of developing, in quite a multitude of men, abilities and even talent which otherwise would have remained unsuspected.

Take, for example, the officers of our new armies. Drawn from all sources, trained at high pressure, and "put to it" by the force of circumstances, they are proving, with few exceptions, a credit to the best traditions of the Army. They have developed the ability to command; and that is an ability of superlative value, for without capable command the efficiency and discipline of an army is wasted.

What is true of a body of men is equally true of the individual. Many a man of excellent abilities fails simply because he is unable to assume full command of those abilities. He is not truly the master of himself, and cannot therefore give effective expression to his own potentialities. This vital fact is forced very emphatically upon the student of Pelmanism, and with very excellent consequences. It would be difficult to say how many men have, through the medium of the Pelman Course, been brought to recognise that their failure hitherto has been due not to lack of opportunity or even of capability, but to their inability to command and direct their own best efforts.

Doubtless this has a great deal to do with the boundless popularity of Pelmanism in the Army and Navy. It would, moreover, seem to be fairly evident that the higher an officer's position and the more onerous his responsibilities, the more fully he is alive to the importance of self-command as the first step to real efficiency.

Pelmanism, as an effective contribution to the successful conduct of the war, should be a theme to inspire some of our ablest writers. The more I learn of its achievements in the Service, the more I am impressed with the desirability of making the Pelman System an integral part of every officers' training. By no other plan can full efficiency—*intelligent* efficiency—be so surely and so quickly attained.

That *thirty-four* generals alone are "Pelmanists" affords eloquent evidence of the justice of this statement. It should be remembered that the discovery of Pelmanism as an aid to military and naval efficiency stands to the credit not of the Pelman Institute itself, but to the Army and Navy. Up to the period of the war Pelmanism had been advocated as a means to business and professional efficiency. But officers of both services from 1914 onwards were quick to realise that it was equally potent to promote success in a military or naval career; hence the present amazing number—somewhere near 10,000—of officers and men who are studying and applying Pelman principles at the front, in training camps, bases, etc.

The late Lord Roberts was much interested in the Pelman System, and whilst in South Africa frequently referred to the benefits to be derived from it—in which the great field-marshal showed his usual prescience. And, like other "ideas" of his, the day has come when the Army and the Empire in general appreciate the justice of his conclusions.

As a system, Pelmanism is distinguished by its inexhaustible adaptability. It is this which makes it of value to the University graduate equally with the salesman, to the woman of leisure and to the busy financier, to the Army officer and to the commercial clerk. The Pelmanist is in no danger of becoming stereotyped in thought, speech, or action; on the contrary, individuality becomes, more pronounced.

Every reader of LAND & WATER—whatever his position and whatever his aims and interests—should read *Mind and Memory*, in which the Pelman Course is fully described and explained. A copy will be sent, gratis and post free, to any reader who sends a post card to The Pelman Institute, 39, Wenham House, Bloomsbury Street, London, W.C.1; and he will thus be placed in possession of the simple facts of the case and be enabled to judge for himself the extent to which "Pelmanism" would forward his efficiency and ambition.

BURBERRY KIT

materialises the three vital qualities of Protection, Durability and Healthfulness

BURBERRY is an important factor in maintaining perfect health and comfort under active service conditions in all climates, however trying.

Burberry Cloths, woven and proofed by exclusive processes, with no rubber or other unhealthy substances to qualify their efficiency: special Burberry models designed by experts with practical knowledge of war, and who have no rivals in their own province—such is the combination of material and design expressed in Burberry Kit.

An officer from the Front recently said to Burberrys—*Your goods are marvellous in the way they wear and what they will do!*

Illustrated Naval or Military Catalogue Post Free

Every Burberry Garment bears a Burberry Label

Officers' Complete Kits in two to four days or **READY TO PUT ON**

Service Uniforms Cut and tailored by experts: in Burberry-Proof Materials.

During the War Burberrys **CLEAN and RE-PROOF** Officers' Burberrys, Tielockens, Trench Warmes and Burfrons **Free of Charge**

COLLINS' LIST.

READY OCTOBER 15th.

THE MIDDLE YEARS

By HENRY JAMES. Extra crown 8vo, with photogravure 5/- net.

This is a part of his autobiography to which Henry James has given the name of one of his own stories. It gives a vivid picture of the London which Henry James entered as a young man.

FIELDS OF THE FATHERLESS

By JEAN ROY. Extra crown 8vo 6/- net.

It is a first book, written by a domestic servant, and is a unique human document. In the form of a story, it is a vivid narrative of the author's own experience. She left home to work for herself at the age of fourteen, and was first a tailoress, starting in lodgings on from four to six shillings a week, then a barmaid in a small public-house, then a stewardess on a river steamer, and finally a domestic servant.

TURGENEV

By EDWARD GARNETT. With a Foreword by JOSEPH CONRAD. Extra crown 8vo. 6/- net.

Those interested in Russia and Russian literature—and who now is not?—will welcome this book. It will be all the more welcome for Mr. Conrad's long Foreword, which is a notable contribution to literary criticism.

IN GREAT DEMAND.

'MISSING'

By Mrs. HUMPHRY WARD. Extra crown 8vo. 6/- net.

'Missing' will thrill thousands of readers, for it is a very vigorous and very daring exercise in imagination."—*Daily Telegraph*.

"A stirring picture of the spirit of England in war time."—*Evening Standard*.

Miss CICELY HAMILTON'S Dramatic Account of the Sack of Senlis:

SEN LIS

By CICELY HAMILTON. Author of "Diana of Dobson's." Extra crown 8vo, with 11 Illustrations 3/6 net.

"'Senlis,' by Cicely Hamilton, is a charming and stirring book."—*Everyman*.

"It illustrates the devil that is in the Germans, and which must be exorcised if ever there is to be peace in the world."—*Sheffield Daily Telegraph*.

MARCHING ON TANGA

By Captain FRANCIS BRETT YOUNG. Extra crown 8vo, with Map, and 30 Illustrations taken on the spot by the author. 6/- net.

"Mr. Young, first in his generation, has written a war book which enables the reader to feel warfare as his own experience precisely as he feels the tragedy of Jude the Obscure or the comedy of Sir Willoughby Patterne."—*The New Statesman*.

"The first war narrative by a soldier, which, as literature, can compare with the best contemporary imaginative work, is Captain Brett Young's 'MARCHING ON TANGA.'"—*Land and Water*.

KNIGHTS OF ARABY

By MARMADUKE PICKTHALL, author of "Said the Fisherman" Extra 8vo. 6/- net.

"Once again Marmaduke Pickthall makes ancient Islam live for us. You might say it was 'The Arabian Nights' written by a realist. 'The Knights of Araby' is to our mind, as fine as 'Said the Fisherman.' The triumph of Mr. Pickthall's work is that the atmosphere of the East is never 'worked up'; it is taken for granted, so that you walk among these Muslims as a Muslim—not as a tourist with a pith helmet and a Cook's Guide."—*Everyman*.

W. E. FORD: A Biography

By J. D. BERESFORD and KENNETH RICHMOND. Extra crown 8vo, with photogravure. 6/- net.

"An absorbingly interesting book. . . . The modern public schools, 'those moral and physical tanneries,' as Ford the elder called them, are being mercilessly criticised on all hands (even by their Sixth Form boys—witness Mr. Alec Vaughn's 'The Look of Youth'). Here is a criticism that is not only destructive but constructive (i.e. a criticism made gently, patiently, with that quiet honesty that is worth a dozen storms of invective)."—*The Observer*.

THE IVORY TOWER. THE SENSE OF THE PAST

By HENRY JAMES. 2 vols. Extra crown 8vo, with two photogravures. 12/- net.

"Most extraordinary and fascinating documents, and we would not have missed them for the world. They are things quite unique in literature."—*The Times*.

LONDON: 48 PALL MALL, S.W. 1.

GO BY THE EVIDENCE

Did you see the convincing evidence in "Land & Water" on September 13th? This follows on.

The
CHEMICO
"FABRIC"
BODY SHIELD SAVES LIVES DAILY

This is the shield the soldiers ask for, the one they will wear

Over one hundred soldiers have voluntarily testified that they owe their lives to the wearing of this marvellously efficient shield. We are happy in being able to put before the public further indisputable evidence received since our last appearance here.

Forwarded by our Glasgow agents, Messrs. The Clydesdale Rubber Co.

"An officer here was hit at short range by a rifle bullet directly over the stomach. The bullet was turned and only glanced through his side, and instead of being killed, as he must have been, he was back on duty in a month. Curiously enough, this officer was new out from home—a Scottish public school boy. He was sent out with a patrol, and a friend had lent him the Chemico Shield."

A FRIEND INDEED.

TO LONDON READERS.—This shield is demonstrated daily at, or may be purchased from, Messrs. May Bros., 374 Oxford Street, W. Obtainable from all Military Tailors, Stores, Benetfinks, Gamages, etc.

Send for descriptive literature.

The County Chemical Co., Ltd., Chemico Works BIRMINGHAM.

OXO LOZENGES

OXO LOZENGES are just the thing to carry on with until a more substantial meal can be obtained.

They contain a high percentage of Beef Extract and Beef Fibrine, and are stimulating and sustaining. Ready for immediate consumption whenever and wherever required.

A Customer writes:—

"I find them very sustaining."

9d. PER TIN.

Of all Chemists, Grocers and Stores, or from

OXO Limited, Thames House, London, E.C. 4.

Behind the Firing Line

The most remarkable and vivid impression of the battle area in France and Flanders is to be obtained from the series of engravings in colour by Captain Handley Read, just published by the Leicester Galleries.

A limited number of copies of this Portfolio may be obtained, price £5 5s. each, from "Land & Water," 5 Chancery Lane, London, W.C.2.

Harrods

Suits that save time!

THERE is that about a Harrods Suit—about any Suit from Harrods—which makes its wearer feel he has the *right* Suit; how much that means discriminating men will understand!

It is a *tailored* suit, and the Ready-to-wear suits we speak of here equal most suits made to measure and excel some.

Ready-to-wear

This Lounge Suit is well modelled, distinctive, and stylish. It is slightly defined to the figure, and smartened by long narrow lapels, with three-button fronts, rolling to the second button if desired, and outside breast pocket. In Scotch Tweeds and Cheviots, various designs and shades of Grey and Brown. All sizes and fittings.

Ready-to-wear **84/-**

HARRODS Ltd, Woodman Purbridge, Managing Director, LONDON SW1

In 14 months we saved the lives of 7000 of Belgium's Little Ones Will you not help us to save others?

The Belgian Children's Fund in Holland (under the presidency of H.S.H. Princess A. de Ligne) appeals for help in the work of bringing sick and debilitated children from Belgium into Holland, where they are fed, clothed, and medically cared for, and then returned to Belgium, for funds do not permit more.

UNLESS YOU HELP, this life-saving work in Holland cannot be continued, and many children must perish.

Remittances to Hon. Treasurer, "Working Men's Belgian Fund" (Registered War Charities Act, 1916), 32 Grosvenor Place, London, S.W.1 (earmarked for the "Belgian Children's Fund").

The New Movement in Art

By Charles Marriott

UNDER this title Mr. Roger Fry has arranged a representative exhibition of works in painting and sculpture in the Mansard Gallery at Messrs. Heal and Son's, 195, Tottenham Court Road. "Movement" instead of "movements" is right and wise, because the new tendencies in art are more comprehensible if they are all regarded as reactions from Realism. That also gives the clue to their real origin: the general reaction from materialism, in philosophy if not in everyday life, at the end of the nineteenth century.

Most of the difficulties about the new movement, about art in general, indeed, are caused by regarding art as an isolated phenomenon, beginning in the studio and ending in the exhibition, without any very close connection with the rest of life. There is, it is true, the conventional saying that art is the reflection of life, but this is taken to mean only in choice of subject. The truth is that no other human activity is more closely connected with the rest of life, or more sensitive to changes in general human development. Choice of subject has very little to do with the matter. It is not what a man paints, but how he paints it that betrays the spirit of his times. For the "how" is very far from being a purely artistic question.

No considerable artistic movement was ever invented in the studio. Dutch Naturalism in the seventeenth century was the artistic response to the Reformation; Pre-Raphaelism was closely connected with the rise of Democracy; and Realism, even in its rarified form of Impressionism, was an article of the same creed that nourished Cruxley and Pasteur. What is invented in the studio is mere machinery; the technical expedient or channel to convey the new impulse. Thus, the distinction between Cubism and Futurism is an affair of the studio; but the distinction between their common origin or inspiration and that of Impressionism is an affair of human life in general. The first distinction is comparatively unimportant and Mr. Roger Fry has been wise in disregarding it in the title and catalogue of his exhibition.

"Reactions from Realism" however, needs some explanation. The desire for reality, in art as in philosophy, is stronger than ever; but we have learnt to look for it below the surface and with other than our bodily eyes. This is very important, because a great deal of the popular misunderstanding about the new movement in art is due to the belief that it represents a new way of seeing—in the optical sense. People say with justice that things don't look like that to them. Nor did they to the artist—even if he should claim that they did. In the optical sense artists see like the rest of us. What the New Movement really represents is a new way of feeling; or, rather, a new recognition of the importance of feeling as a guide to reality. The evidence of the eyes, which was the basis of Impressionism, is exchanged for the larger evidence of the whole organism, with its full complement of memory and intuition as well as observation. In

art, as in philosophy, we have discovered that things are not what they seem; that reality lies deeper than appearance.

Not that the discovery is altogether new. Art has always been based partly on intuition—using that word to cover all the evidence of the sub-conscious mind—and partly on observation. The history of Western art is largely the history of conflict between the two. At some periods and in some individuals one or the other has got the upper hand. In Eastern art there does not seem to have been the same conflict; but intuition and observation, or inner and outer vision, or faith and reason—for they all mean pretty much the same thing—have always worked comfortably together. Chinese art is based on conceptions corrected by observation. Western artists are comparatively unused to dealing with conceptions; even their designs are applied apologetically, as if the facts observed had a special sanctity in themselves; and it is not surprising that when, as now, they work from

conceptions that they should reject observation with rather more force than is necessary.

The parallel to what happens in spiritual life is too close to be ignored. A person of confirmed spiritual life has no difficulty as between faith and works, but if a person who has lived by works alone is suddenly "converted," he is apt to rely on faith too exclusively in view of the imperfections of human nature. This is exactly what has happened in art. For several centuries Western art has lived mainly by works; using that word to describe the mastery of external appearances. Justification by works in art reached its climax with Impressionism. In the reaction it was inevitable that there should be something like contempt for appearances, and most of the defects and extravagances of the new movement can be put down to that cause. What it amounts to is that in the present state of human perception, both Martha and Mary are necessary in the house of art. It is by works in life and by appearances in art that one human being understands

By E. McKnight Kuuffer

The Policeman's Cottage

another; and until we shall have reached a degree of sensibility to pure form and colour in painting that we already enjoy to pure sound in music, the broken box of alabaster must be supplemented with some care in the performance of common tasks. Otherwise the less perceptive will cry: "To what purpose was this waste?" And it is noticeable that in the later developments of the new movement there is a disposition to regard appearances with a more tolerant eye than at the beginning. The war paintings of Mr. C. R. W. Nevinson may be quoted in illustration.

The works in Mr. Fry's exhibition might be classified as belonging to several "isms," but they have it in common that they are all done from conceptions and not from observations of reality. The nature of the conception varies with the individual artist, and emphasis is laid accordingly upon rhythm or pattern or colour or volume as the case may be. It is worth remarking that it is only when realistic imitation of appearances is abandoned that any such emphasis can be made

without the effect of untruth. Once accept the evidence of your whole organism, instead of the mere optical evidence of your eyes, as the basis of your art and you can reduce the appearances of Nature to geometrical forms with out any prejudice to reality. As will be seen, most of the works in this exhibition are indulgent as regards appearances; but in all of them appearances are dealt with as conceived by the mind rather than as perceived by the eyes.

One consequence of this new trust in conceptions that I have never seen remarked is the rehabilitation of materials. To put it crudely the pictures look more "painty" and the sculpture more "stony" than perhaps the visitor has been accustomed to see. But a moment's consideration shows this to be inevitable. So long as the materials of art are used to imitate appearances they cannot be allowed to declare themselves; and it is one of the advantages of the new movement that it does allow the materials a voice in the matter.

For damaging comparison the critics point to the exquisite workmanship of Eastern art. That criticism answers itself. Eastern art has never used its materials for the imitation of appearances; it has always regarded them as creatures with an expression of their own; and, consequently, it has acquired and taught a perfect technique for their artistic fulfillment. In effect the Chinese artist shows the subject to ink or water-colour or ivory or jade and says: "Now, what do you feel about it?" And, with his collaboration based upon an intimate knowledge of and punctilious regard for its capacities for expression, the material responds in its own character and according to its laws; not only in substance, but in characteristic form. One of the beauties of Chinese ivory carvings for example—as of mediæval ivory statuettes of the Virgin—is the way the natural curve of the tusk is allowed to determine the sway of the figure.

All this is new to the modern Western artist. Whether in his own person or by tradition he has acquired a highly organised technique for the purpose of imitation and he cannot all at once acquire the refinements of expression. Even that blessed phrase "the limitations of the material" has a new meaning; since it is obvious that the limitations of a substance for imitation and for expression are entirely different; and some at least of the extravagances of the new movement are due to the fact that artists have not yet recognised the new limitations—that paint, for example, will not stand alone like a block of marble but must be contained in definite

shapes, whether naturalistic or formal. Exactly the same thing happens in life. If you have lived under the law you will not all at once adapt yourself to the freedom of the spirit. Something of this sort is happening in Russia.

On the whole the new movement seems to have reached a greater refinement of quality in drawing and sculpture than in painting. This is natural because, even in Western art, the materials of drawing and sculpture have never been used—or abused—for the purpose of imitation to the same extent as have the materials of painting. Consequently the draughtsman and sculptor—and the public also—have less to unlearn. At any rate, there is nothing in the exhibition that reaches quite the same level as the beautiful little "Mother and Child" by the late Gaudier-Brzeska. Here is a thing said perfectly in marble, not only in respect of substance, but of what may be supposed to have been the natural disposition of that particular piece; all the carving being kept within an imaginary ovoid which both contains the emotional meaning of the work and preserves the habit of the stone as it came into the hands of the sculptor. The effect of something "found" in the block could hardly be more happily illustrated. Another work that leaves nothing to be desired in quality of performance is "The Ass," by Mr. Duncan Grant, which is produced here. Not only does it convey the quaint essence of the subject, in its unbroken state, but in actual execution it is as expressive of the materials used as a piece of good embroidery.

A point that has often been urged is the childishness of many of the works in the new movement. Substituting "childlikeness" the charge may be accepted as part of the consequences. Because the child is much less subject than most of us to the optical heresy, and relies much more on that general "sense" of things which is the basis of all conceptions. I believe that the extraordinary homeliness of such pictures as "The Policeman's Cottage," by E. McKnight Kauffer is due to the fact that they recall our impressions of landscape before we began to peep and botanise. The visitor to the exhibition should dismiss from his mind all ideas of optical jugglery. Allowing for all differences of "ism" and method, and granting all imperfections of practice, the new movement in art is an attempt to convey reality as conceived by the mind freed from the tyranny of optics and fed from the deepest reservoirs of feeling. The eyes are used, but as channels and not as critics of reality.

"We cannot take the word of the present rulers of Germany, unless supported by the will and purpose of the German people."—President Wilson in reply to the Pope's note

THEIR DUTY

— your Privilege

THOUSANDS of Employers are naturally exercised on the subject of additional provision for the dependents of those of their Employees who, on Active Service, may lose their lives—from Ordinary Causes, from Accident, in Action, or from Wounds, etc.

The usual conditions of War preclude protection under ordinary forms of Insurance, yet the need for some form of cover is obvious.

The State very properly provides pensions upon a fixed schedule, but employers recognise that such pensions must frequently be disproportionate to the normal circumstances of the dependents of their employees. In America the State provides

a certain pension, but has in contemplation allowing the individual to apply a certain proportion of his pay in the form of an Insurance Premium to enable him to some extent to rate up the amount his family would receive in the event of death. There is no similar scheme existing at present in this country, but certain adjustments are rendered possible to the individual under

CONDITIONS OF VICTORY

IN the series of articles which Mr. Hilaire Belloc is now contributing to *LAND & WATER*, he wisely leaves "peace" out of the question, unless it is precluded by "victory," for it is only by victory, full and complete military victory, that the Allies will be in a position to impose terms and insist on punishments which are absolutely vital to peace, vital also if European civilisation is to be preserved. The speeches delivered on Monday afternoon at the Albert Hall by the Prime Minister and the Chancellor of the Exchequer dwelt on this point of view which is familiar to the readers of this journal. Mr. Lloyd George declared that without full victory, "there are men and women in this hall now who may live to see the death of civilisation," and Mr. Bonar Law asserted that without full victory "the economic condition of Great Britain would be intolerable." General Smuts dwelt on another aspect, on one which, in our opinion, is not sufficiently spoken about. He said that "the true battle front of this war is in the soul of the nation." The illusion is common at home that the individual is of little worth in winning the war. "A bomb falls one night," they say, "and we, ourselves, and perhaps our families, are wiped out of existence; but it makes no difference, the war and the world go on just the same. Our lives are, it would seem, valueless, so why trouble ourselves about the way we order them, seeing we make no difference living or dead." It is an illusion which tends to weaken and undermine resolution, and in order to engender and foster just such illusions Germany wages war on civilians. It is well, therefore, that this truth on which General Smuts laid emphasis should be impressed on the popular mind:

The battle front is not merely in France or in Flanders; the battle front is here in this country also. And you, as you sit here to-day, the women and children, and the men of this country who do not belong to the Army, can take your place by your comrades and join in the fight just as those in France and Flanders.

"German industry, German education, German science, German politics, German diplomacy, German flesh and blood for generations have been devoted to the destruction or enslavement of their neighbours"—so spoke the Prime Minister, and his words are the plain truth. There may be those in Germany who regret that these things should be, but they have never exerted their influence to any purpose, and they have been powerless to change or check the current of national opinion. We still look in vain for either the old Germany or the new Germany, which we are told is the true Germany by those who believe that if the Hohenzollern blight were removed we should discover outside Prussia a healthy national growth. Would that it were so, but that it is not so is testified by every prisoner of war that finds his way home, and still more strongly by every act of war which Germany perpetrates. The invasion and dis-

ruption of the Zeppelin fleet has distracted the general mind from a much more important incident of last week—we refer to the destruction by German armed raiders of the small fleet of neutral ships and of their escort of two destroyers in the North Sea. An Admiralty inquiry has now been instituted, and in the meantime we must suspend judgment. It may be said, with some justification, that such incidents damage our naval prestige, but that should not lead us to underestimate the great work so efficiently and untiringly performed by the British Navy for the past three years. Mistakes of strategy and administration have occurred, but because of these errors to call on the Navy to perform miracles and to undertake operations which the very voices which demand them, would be the first to denounce when they failed inevitably, seems to us neither reasonable nor right. There the matter from the British standpoint remains at the moment, but from the German standpoint something more must be said.

To sink the trading ships of neutral countries, without giving the crews a chance of saving their lives, and, moreover, to fire on the boats which these very ships had launched for the purpose, is the most outstanding act of barbarism which the German Fleet has yet accomplished. Not a single excuse can be urged in mitigation of this cold-blooded massacre, nor can the Captains of the two German cruisers be exonerated from the crime. These were their own masters in the hour that these murders were committed. The chivalry of the sea is a law far older and higher than any command of the Kaiser or his Admirals. Had their officers displayed even a rudimentary sense of righteousness or mercy, would they have been punished for it? The fact is, they acted according to their natures, and their natures are not peculiar to themselves but common to their nation? In the drowning and slaughter by shot and shell of these defenceless Norwegian and Swedish sailors, we behold the reflection of "German education, German science, German politics," etc., and until these crimes are punished in the same manner and degree that similar crimes are punished in civil life, Europe can never be made secure against a fresh outbreak of the same barbarism.

The danger is that the conscience of the Allies may be drugged by the very excess of Teuton blood-lust. We have to be on our guard against this, for it is a perfectly right and healthy emotion, in ordinary circumstances, not to permit the mind to dwell on pitiless and horrifying incidents. A murderer commits as bad an offence against the public conscience as against his victim, a truth which we may easily recognise by the way in which normal and active minds revolt from sensationalism in peace times. But it would be cowardly to assume that mental attitude towards Germany. The full measure of her abominations has yet to be told, and it will be told. One of the first conditions of victory is, a just retribution for these inhuman offences.

Before another week comes round in all human probability London will be again under the murderous missiles of German aeroplanes. This incident of the war is accepted with extraordinary composure by the British inhabitants of the metropolis. When out of the dark mists of night, death, let blindly loose by an enemy whose pride is cruelty and ruthlessness, destroys at one blast half-a-dozen babes, as happened last week, there is naturally a cry of horror, but there is not the slightest intention, because of this, to deflect the nation's determination towards final victory. The British character does not change. One has only to recognise the unalterable resolution, which in the outer parts of Empire, under similar barbarities, has at different times established that *pax Britannica* on which Britons, not without reason, have prided themselves in the past, in order to realise that if there be one act of faith more fixed in a British breast than another, it is that no harm men can do to the body can destroy the purpose of the soul. It is in the knowledge of this truth that even the humblest British citizen can find personal satisfaction. His life is not lived in vain if to the last hour he clings to this belief and acts on it, for this belief is the sure rock on which final victory has ever rested and shall ever rest. We have no wish to see German homes suffering under aerial bombardments in the way English homes have been made to suffer. But if Germans will have it so, they must have it.

The Operations in Riga Bay

By Hilaire Belloc

THERE has been some misconception with regard to the nature of the operations in Riga Bay and on the islands which intervene between that sheet of water and the Baltic: I mean misconception on the geographical character of these actions, not on the ultimate strategic object, which can only be a matter of conjecture—though that object seems most probably to be the one I indicated last week. Thus the *Times* and other newspapers have spoken of the Russian Fleet, or rather of a portion of it, entering the Gulf through the Moon Sound, and after being defeated in action within the Gulf of Riga by the German Fleet, retiring again through the Moon Sound northward.

To take this view of the battle is clearly erroneous, as a consideration of the Chart later in this article will show. Nothing can get in or out of the Moon Sound by the north except vessels of light draft. What has happened is, in the most general terms, this:

A Russian Squadron, detached in the Gulf of Riga, containing both light and heavy vessels, was attacked by the German Fleet when the Germans had become masters of the Irben Channel at the South end of the Gulf between the island of Oesel and the mainland. The German Fleet came through the Irben Channel when they had cleared it; drove the Russian Fleet up northward and cooped it up in Moon Sound. In that narrow and rapidly shoaling waterway, the largest of the Russians was sunk by distant gunfire of the enemy operating from the mouth of the Sound, where there is deeper water, and four other ships of considerable draft ran aground. All that can have got away northward of the Russian Naval Forces were the boats drawing less than 15 feet of water.

The only entrance into the Gulf of Riga for large vessels—for vessels that have to keep an eye on the five-fathom line—is the Irben Channel between the southern end of Oesel Island, that is the Sworbe Peninsula, and the opposite Courland Coast which, from the so-called "Dome" Hill, 280 feet high, is generally known after the local cape as the "Dome Ness." The Irben Channel (see Map I) is entered by a not very wide

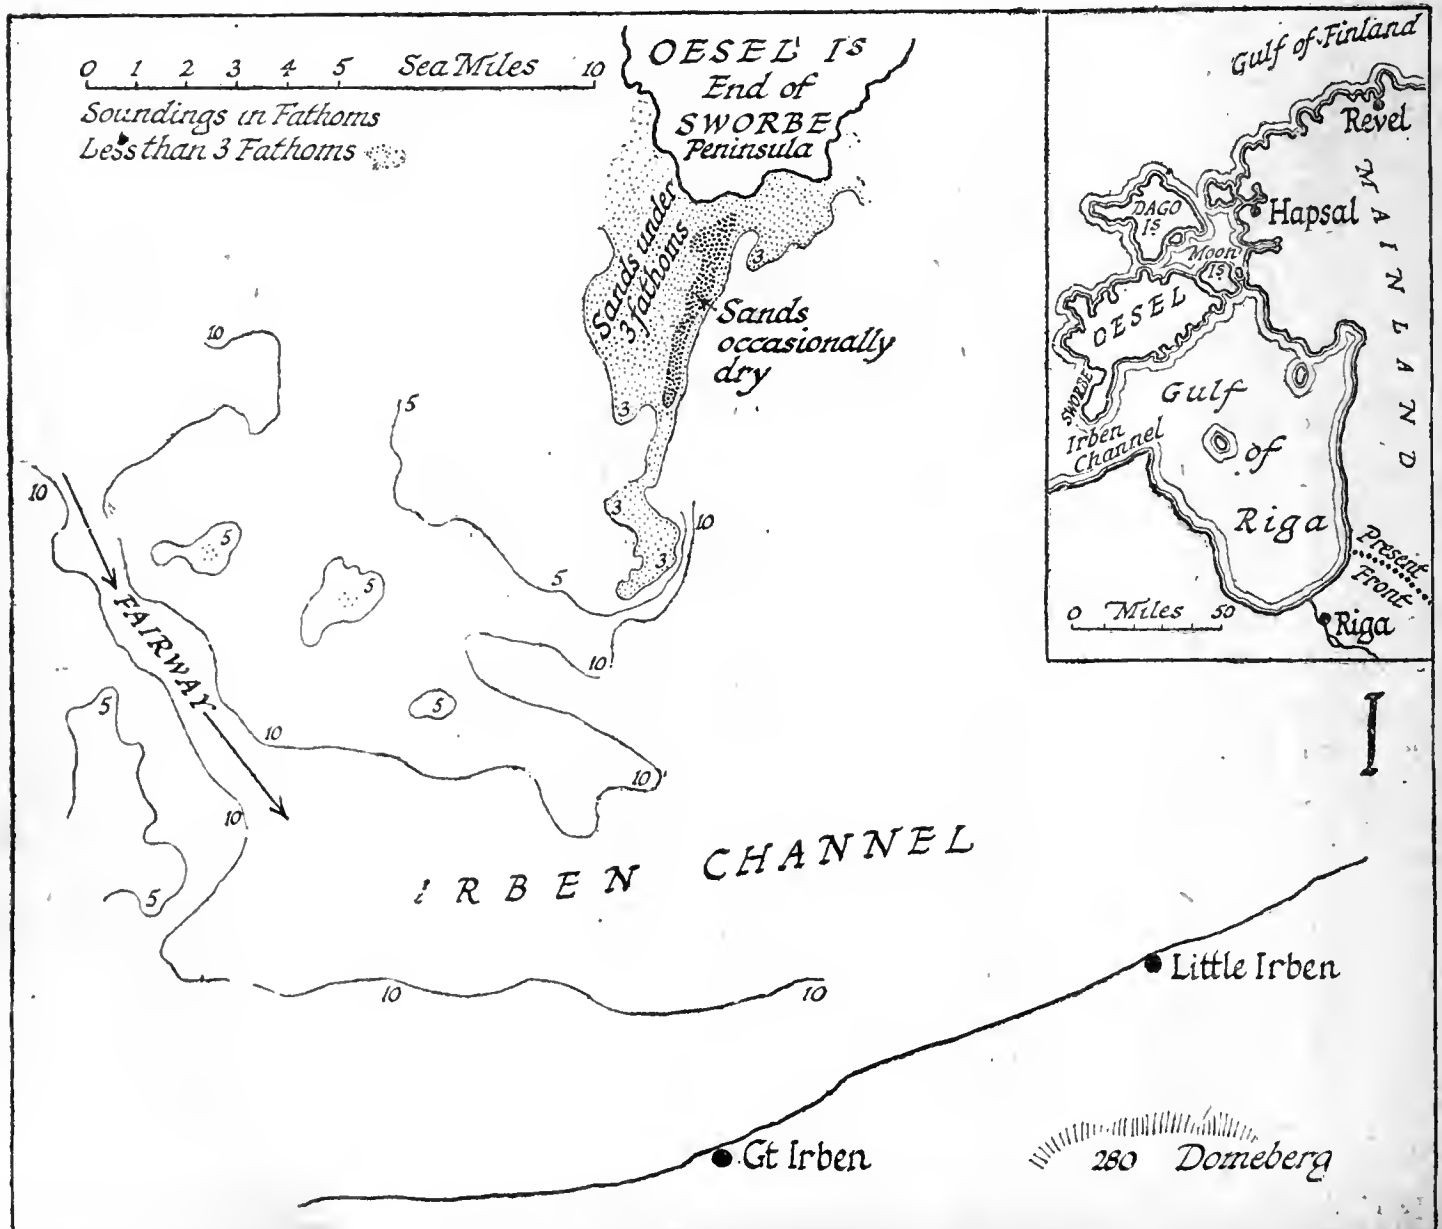

but long fairway lying north-west by south-east, easily blocked by mines, and with the advantage of current on the side of the defensive: For the current sets out from the Gulf of Riga to the sea continuously. Reasonable vigilance made this Channel quite impracticable, and it needed the present collapse of Russia to give the enemy his chance.

Even so the mines in the Channel could not be directly swept away from the open sea, and that was why the island of Oesel was attacked. Its capture was easily effected, and once the Sworbe Peninsula had been swept there were no Russian guns commanding the Channel, but in their place German guns protecting the German sweepers who proceeded to clear the channel. It is probable also that the enemy found light craft on the eastern shore of Oesel to help him in the sweeping of the mines. But, at any rate, he got the Channel clear. The main German Fleet then came through the Irben Channel into the Gulf of Riga.

Such Russian forces as were present in that sheet of water retired before the German fleet and were cooped up at the northern end by the advancing Germans into the mouth of what is called the Moon Sound; that is, the sheet of water between the Island of Moon and the mainland of Esthonia.

If we look at the Moon Sound in some detail on Map II we shall be able to understand what happened.

The ten-fathom line—deep water in which the largest craft can manœuvre at ease—stands well out from the mouth of the Sound. As you approach the Channel the bottom shelves rather sharply, but right through the middle of the Sound there is a draught of water just sufficient for (though only just sufficient for) the larger units present of the Russian Fleet. The five-fathom line recedes on either side, leaving a fairway on the west side of the small island of Schildau. On the east side, between this island and the main land, large craft cannot go. The Russian Naval Force, therefore, retiring before their superior enemy, took refuge in this prolonged and narrow gulf of deeper water. It was here that the *Slava* sank, and that four other ships ran aground.

The small craft got away to the north, and it is the mention of this fact by both the Russians and the Germans which has given an erroneous impression of what occurred, for the escape of these smaller vessels is alluded to in very vague and general terms, such as "the remainder of the fleet," etc.

The fact that only the smaller vessels could have got away is clear enough from a glance at Sketch II, where it will be seen that the northern approach to Moon Sound all the way from the northern coast of Moon Island to the main land is blocked by a ridge, the western half of which is called the Kumorsky Reef, and the whole crescent of which forms a complete barrier against entry or exit by the north, save for vessels drawing less than fifteen feet of water—indeed considerably less than that draft, for this amount of water is only found in very few variable points.

It is true that the level of the Baltic here rises slightly when there is a combination of strong westerly winds and of melting snow and ice inland, but the present moment is a season of nearly the lowest water with easterly winds and the rivers low. Moreover, even when there is the greatest difference of level, it hardly adds another three feet.

It is to be noted that the operation has taken place while there are still before the enemy several weeks of open

The Conditions of Victory—III

THE last and third part of the enemy's propaganda, to which the first two parts lead up, is the demand that the Allies should state specific terms of peace. The suggestion being that the enemy is too strong to be decisively defeated and that negotiation must be resorted to (a suggestion the falsity of which was shown here last week) it is concluded that no reasonable man would deny the advantage of stating particular terms.

Now even if all the rest of the enemy's propaganda were true, even if the absurdity of an innocent German people writhing under a hated tyranny, or the other flatly contradictory absurdity of an unconquerable German people, were possible in the real world, this third contention for a detailed negotiation of peace before victory is utterly untenable in the present circumstances.

The main reason for this is the nature of the issue between the two camps: Its magnitude and its simplicity. If it be true that the enemy's armies are unconquerable, then much

water. The shores of the Baltic here, and the Gulf of Riga in particular, freeze in a very changeable manner. The Irben Channel was open the whole winter during four of the eleven years 1893 to 1903, and though ice forms, of course, much earlier in the rivers and is discovered on the shores before it creeps outwards, it is a very early year in which navigation is interrupted before winter has well set in. January to March is a sort of normal period of interruption, though the ice has stopped navigation in the ports two months earlier and two months later than those normal dates in exceptional years.

The Zeppelin Raid

The Zeppelin raid with its astonishing sequel, hardly falls within this department of LAND & WATER, but it is too remarkable a passage to leave quite uncommented.

So far as the evidence stands at the moment of writing, it seems that eleven Zeppelins left Germany on the Friday. Of these three got back by the direct eastern route which all, obviously, must have been under orders to follow. But of the remaining eight, all were in some fashion damaged in various degrees or thrown out of their course or lowered by loss of gas, and were condemned to reach home as best they could after a bad deflection southwards. Of these eight three may have landed in Germany, with what losses we do not know. Five are accounted for by the French observers: one captured entire, three brought down, and one blown out to sea over the Mediterranean, half wrecked.

Though one has nothing but conjecture to guide one, the first thing that will occur to anyone who considers the main facts is, that the fleet must in some way have got crippled—or, at any rate, that part of it which drifted over France.

Whether it was crippled by gunfire in this country or, as has been suggested in some quarters, by unexpectedly severe frost suffered at a great height after engines had been stopped, or by both these agencies, or whether perhaps there may not have been added to such causes a violent northerly gale at the great heights in which these craft were operating, we have not yet been told. But it is entirely incredible that they merely lost their way.

It is not incredible, but it is highly improbable that such a fleet should have any intention of travelling even over northern France during daylight—and it was largely due to the fact that they were caught by daylight that the Zeppelins suffered so heavily. The one which had the worst luck was the one that came down at St. Clement, near Lunéville, south of Nancy, quite close to the opposing lines. Those which were accounted for in the south must, in the nature of things, have been out of control and at the mercy of the northerly current. Yet another drifted out to sea over Toulon at the end of the day, and apparently has been lost in the Mediterranean.

But the most extraordinary part of the whole series, and that on which we shall most eagerly expect details, is the capture of one of the Zeppelins intact with her crew unhurt apparently, and in full working order near the little watering place of Bourbonne on the high ground between Langres and the Upper Moselle Valley.

There must be remembered in this connection a very striking point illustrative of more than one of the enemy's methods. The crew of this captured Zeppelin—L 49—used (we are told) parachutes. The crew of the Zeppelins, unlike the observers in a kite balloon, have not been, I believe, furnished with parachutes before. Regulations of this severity work both ways. They tend to the conservation of material to the last moment, but they also tend to exasperation in a moment of crisis and, when the limit of endurance is reached, to ill judgment and perhaps to mutiny. The rule seems to have been changed, perhaps, as a concession.

the simplest thing is to admit defeat; to say, "We intended to safeguard our future and that of Europe. We have failed in the attempt. We will stand back where we were before and in the future the struggle must be renewed." It is the strongest and the best thing for anyone to say who once desired victory but has come to believe it impossible.

Personally, I do not believe that there are any men on the Allied side to-day who at once desire victory and believe it to be impossible. I think that those who are talking of the impossibility of a decisive victory are men who desire to save Germany from the moral consequences of her acts. But I say that if there are men who honestly desire victory and yet believe it impossible of achievement, then it is far the best thing for them to admit defeat. It was the attitude of the French patriots in 1871. They said: "We are compelled by mere force to cede what the victor has no moral right to. We know that this thing is only a truce, and sooner or later the issue must be fought out again."

To-day the issues are far greater than they were in 1871.

They concern not one nation but all Europe. They concern in particular this nation, of which only a minority (least of all those who so foolishly advise surrender) as yet fully understand what defeat would mean for their country and for their individual selves.

But if you do not believe that victory is impossible, if you think that the Allied armies are capable of achieving it, then to discuss the details of peace is like discussing with a criminal what punishment he will accept.

The terms which the Allies will impose if they are victorious, that is, if they succeed in putting the Prussian military machine out of action are such as are not worth discussion with an undefeated Germany, simply because the existing Prussian military machine will not sign its own death warrant. They involve—to put it in the most general fashion, two fundamental propositions which an unbeaten Germany will never accept, *first*, the tremendous burden of material reparation, *secondly*, the moral indignity of seeing *individual punishment* meted out to the men responsible for innumerable particular crimes. They further involve the imposition of guarantees, that is, in plain English, the taking of material hostages for the carrying out of stipulations to which the mere word of the enemy in any form is worthless. When Prussia levied a vast tribute upon France from 1871 to 1873 she occupied territory until the tribute was paid. She maintained herself in the position of victor after the destruction of the French armies, long after the mere signature of peace, and she had no choice but to do so. The "freer," the more "democratic"—in simple and truer language the more expressive of the national will—the political system of the vanquished may be, the more certainly must they attempt to evade the consequences of their crime.

Now what Prussia has to lose is military power and the economic power which her military power safeguards. She has to lose supplies of iron which she took by force; she has to lose Polish subjects, her tyranny over whose territory was the origin of her power; she has to lose a vast amount of shipping to help replace that which she has destroyed; she has to give free access to the Baltic—first to a free Poland, and next to the commerce of all nations. She has to abandon her grip over the Eastern trunk route; she has, as we have said, to see the more criminal among her leaders subjected to the indignity of public punishment, and she has also to devote years and years of labour for the profit of others in repairing what she has destroyed. She has at least to suffer this, or alternatively to boast her successful defence and our own defeat. The conception that such justice can be imposed without victory in the field is lunacy. The conception that without its imposition Europe can possibly secure stability is ignorant folly.

There is a school which tells us that to say things so plainly is to "stiffen the resistance of the enemy." Heaven knows where they got that conception! If this were a war for petty local political objects to which the fighting had hitherto been limited, it might be true. If whole nations had not been strained to their utmost to achieve the fullest national objects it might be true. But as things are it is a statement quite out of touch with reality.

The resistance of the enemy is *already* stretched to the utmost of which the enemy nations are capable. In that resistance the German Empire has come at last to drawing in boys of 17 and subjecting them to the massacre of modern war. In that resistance the enemy coalition against us has lost something like four million lives. In that resistance it has already suffered the most severe privations and is approaching famine. The conception that we should in some way increase that resistance by repeating once again our unalterable determination to conquer, is wildly unreal. You might as well say in the last rounds of a prize fight that the man who is getting the better of it must hesitate to deal heavy blows lest he should rally some reserve of force in his unfortunate opponent. There is nothing left moral or material upon which the enemy can draw beyond what he has already mobilised, or has marked down for use. All his populations, including his voluntary Allies and those whom he commands as a tyrant, have been thrown in for all they are worth. If the resistance is successful Prussia has won. If she is pushed up to the breaking point, she breaks altogether. That is the situation, and one would have thought that a child could see it.

Strains of this sort are absolute and maximum strains. And strains of that kind when they are resolved at all are resolved by nothing short of complete ruin.

But apart from these general considerations we should do well to note the particular character of the propaganda for the discussion of peace terms. It is well worth remarking that *the whole of it is conducted upon the implied suggestion that the enemy's defence will be victorious*; that a decision in our favour is impossible. It is based upon the idea that Prussia will concede this or that of her free will still undefeated and that justice cannot be imposed upon her.

It is remarkable that in all these debates which have

been so prodigally nourished with money for some months past, there is no statement of extreme terms upon the *other* side. The writers who in this indirect, but very useful, fashion are serving the enemy do not say: "Here is the maximum which the Allies could possibly impose, and here is the maximum which Prussia in her present state could possibly retain. Let us see what compromise can be made between these two extremes." Even if they did this it would be our duty not to listen to them, because a civilization fighting for its life should not hear of compromise at all. But as a fact they do not state it thus at all.

Yet that is how they should state it if they were sincere. A true arbitrator, a man really impartial between two contendants and even indifferent to their opposing morals, considers before striking a balance the *full* claims of each. Yet these self appointed arbitrators, though they profess themselves so impartial as to be unaffected by cruelty and bad faith and indifferent to the religion and morals of our civilization, never consider the Allied objects. They always take as a "basis of negotiation" the claims of an undefeated Prussia.

Let us consider a few examples of this.

In the matter of the rectification of frontiers in the West we have not got two schools in the debate, one of them saying Germany must be allowed no bridgeheads across the Rhine. We have only the timid suggestion that perhaps as a very great concession upon the part of our enemy she will allow in the one particular case of Alsace-Lorraine a vote to be taken while she is still in power, without any consideration of the innumerable families exiled; of the plantation of foreigners in the district; of the pressure that can be exercised by Government; of the fear of the future in the voters created by their experience of the past. The whole thing is in the tone of a small kindly concession by the enemy. It has nothing about it of a compromise between extreme claims. In the United States the "high brow" papers like the *New Republic*, do not even allow this. Lorraine, they say, must remain German because Germany needs its iron!

Take, again, the case of the occupied territory. There is no balancing of, on the one side complete reparation, heavy indemnity to those who have been enslaved, large payments to the families of those who have been murdered, the rebuilding of all destroyed monuments and private houses, the restoration of agriculture, etc, and mere evacuation upon the other. No, the pretence at reasonable dealing is entirely in the enemy's favour. Evacuation is all that is spoken of as "reasonable" the rest is ignored.

A Fair Analogy

It is as though a man came into your house, robbed your safe, murdered your children, set your books on fire "to make an example," incidentally burnt down your house as well, and then when you had caught him and got him on the ground (at great expense to your furniture) appealed to a third party, an "impartial arbitrator" who should say: "Come! Come! All this is surely very wrong! This gentleman must certainly leave your house—or rather the ruins of it—it is the only reasonable solution!"

Take a third case, the case of Poland. There are all sorts of pretty schemes for a restricted, mutilated Poland under German tutelage: a Poland that would be a mere expansion of Germany. But you never hear the claim to Danzig on the part of these gentry who profess their sincere desire for a stable European peace; you never hear any talk of the mineral wealth of Silesia shamelessly stolen from the Polish people; and when statistics are quoted as to the proportion of Polish population in the districts robbed by Prussia no more than three generations ago, *the statistics are always German statistics* in which every official, down to the very gaolers, are counted as normal inhabitants of the districts, and every man who can speak a little German is put down as being of full German blood. It is the same thing with the Adriatic. It is "only reasonable" that Austria should have an Italian town somewhere on the Adriatic. It is "only reasonable" that the main part of the frontier should lie south of the defensive line of the Alps. You never hear the full Italian claim mentioned and balanced against the Austrian claim, or rather against all that Austria can now hope for.

What is always put forward as the golden mean in every single case is the very most that the enemy could possibly get out of us even if, when peace were made, he were as strong as he is to day.

I marvel that opinion has not yet been struck by this singular phenomenon! Here are would-be arbitrators posing as men who are balancing discordant claims, and as folk who know that neither party to a quarrel can obtain all that it desires—but when they come to details (of which they are very fond) those details are simply the maximum conceivable demands of the enemy in his *present* state! All the statistics are enemy statistics. The future envisaged is a future

in which the enemy shall remain strong and be capable if he lives of becoming stronger. The conception of punishment for evil done—surely the most elementary idea underlying all human justice and all stable solutions—is not only eliminated but actually attacked.

There is another feature in all this to which I would draw my readers' attention.

Where, in the past, were these fine pleaders for a reasonable compromise? We know their names and see their writings. How comes it that they had nothing to say of this sort until Germany had lost her offensive power and was bleeding to death? Which of them proposed a *plebiscite* in Alsace Lorraine when that district was as yet not fully colonised by its robber, and before the full effects of exile had taken place? In what books or speeches did they advocate the restoration of Poland? Where shall we find their passionate defence of the Italian claims to fellow citizenship with the pure Italians of the Trentino?

It is notorious that we never heard of these things from them until the present pass, and surely such a fact is not only significant but conclusive. It is equally significant and equally conclusive that we heard nothing from them during the first half of the war, when it seemed within the power of the Central Empires to commit any injustice and to obtain a decisive victory for themselves.

If it is such a monstrous thing to *punish* men who have ordered murder and arson and pillage, and to make such an example of them that for the future we may be secure from a repetition of those deeds, why was it not equally monstrous to *commit* them? One would have thought that the murders at Dinant and at Louvain and at Sermaize and at Nomeny and countless other unhappy towns, and even at Senlis, before the very gates of Paris, would have affected men who profess to be superior to national feeling and to consider nothing but the claims of humanity. They were strangely silent!

In the same way they tell us it is unreasonable or bad policy to contemplate the confiscation of German shipping or the reparation by force of damage wantonly done on the high seas. But oddly enough this tenderness does not apply to murder on the high seas when that murder is committed by the enemy, it does not apply to the sinking of ships without warning or to the shelling of men in open boats.

There has come in, as I write, the account of their latest crime of this sort. The German cruisers, ships amply able to have saved the crews and passengers of *neutrals* at their mercy, deliberately massacred these neutrals, men and women indiscriminately. It was sheer butchery for the sake of butchery, and something of a sort Europe had never known until this war, and in this war has only known as a Prussian thing.

Our "reasonable men" will tell us that the men guilty of such crimes "must not be left after the war with a feeling of bitterness."

They will bid us regard these wanton murders as normal enough—just what we should do ourselves.

All these German bestialities are, it seems, no more than "the inevitable concomitants of war."

Let us remind those who talk thus (from whatever motive) that if abominations of this sort are "the inevitable concomitants" of war as Prussia makes it, then certain results, very unpleasant for Prussia, are also the "inevitable concomitants" of peace, as it must be imposed upon Prussia. A certain amount of pain and discomfort are "the inevitable concomitants of physical struggle" as it is understood by the garrotter, but then also certain other unpleasant things are the "inevitable concomitants" of what happens to the garrotter when he is caught. The man defending the garrotter may say that the sufferings he has imposed upon his victims are only an extreme case of the annoyance which people always suffer from horse-play; and that garrotting is only an extreme form of horse-play. To this the magistrate will answer that he does not even allow horse-play upon unwilling victims, and is quite prepared to meet it with a fine or a short term of imprisonment, but that there is a certain difference of degree in the case of the garrotter which corresponds to a difference of degree in the fate the garrotter must be prepared to meet when he has the misfortune to be "thrown upon the mere defensive"—that is, to be in the dock.

It is not true that Europeans in modern war have normally marched through and sacked neutral territory, or raped, burnt and murdered in it as they passed through. It is not true that Europeans in the many unfortunate wars of the nineteenth century sank ships without warning (including neutral ships and hospital ships), secretly placed explosives on merchant ships, deliberately murdered men and women in open boats, or did any one of those acts which have specially marked this last phase of Prussian war.

Those who pretend that there is to-day a case for an easy consideration of what has been a mere misunderstanding with equal and ordinary faults on both sides, are saying something

flatly in contradiction with the facts. The facts are simply that one party in this war was the open admitted and boastful aggressor, and that the same party, and *not* his opponent, has initiated every new cruelty in actual fighting and has *alone* been guilty of novel crimes against non-combatants and civilians.

Those who deny that plain proposition are like men who deny visible and tangible objects in the world about them.

I will go so far as to believe that some of them are capable of self-deception up to a point hardly distinguishable from derangement, but the mass of them must be in bad faith.

And here, I think, is the strongest ground on which we can stand in our exposure of these men who would throw away all the chivalry of Europe and all the lives of the young Englishmen dead. We can say with conviction and with all the existing evidence at our back: "Even those of you who are only dupes, who have not taken enemy money and are not in touch with enemy organisations, or the money and organisation of interests which happen to coincide with the enemy (of cosmopolitan financial interests, for instance, making for immediate peace) are filled with a very strong bias in favour of the enemy. You have in the past admired the society which he created, his offensive acts and his perverted morals. Therefore, is it that you are to-day willing to condone the logical consequences of these things as they appear in Prussian war. But we will not condone them."

Falsity of Premises

We may sum up the negative part of our argument—the rebuttal of the claim to detailed discussion of peace terms—by saying, that of its three parts, no one will stand examination:

(1) It is not true that the German people are an oppressed majority hating certain cruel masters from whom it is our business to free them; a "militarist party," or "Junkers," or what not. The Germans are one body: welded together by the victories of a generation ago. *They*, not their masters, made this war. It is indeed true to say that, had not their Government moved, the populace would in some short time have overset that Government rather than fail to embark on that career of mastery to which they believed themselves destined.

It is equally true that they applauded and continuously applaud every successive baseness in their conduct of war; that the "degeneration of war to indiscriminate murder," the contempt of chivalry, has been a national thing with them. As a nation they have acted, and as a nation they must suffer.

As for the talk of making them accept "Democracy," and the phantasm that this would secure Europe, it is a phrase devoid of meaning; and as for the idea that their reluctant acceptance of a Parliamentary Caucus with its professional politicians and the rest, would safeguard us, it is merely contemptible. If we wish to *weaken* them, by all means let us force such things on them. But no man seriously pretends to-day that these things help to a just and pacific expression of the National will.

If those who thus talk of a "Democratic Germany" mean a Germany imbued with the spirit of human equality, of human dignity—why then we might as well be fighting to make our enemies converted to good manners, or the use of irony, or an admiration of the classic ideal. There is no positive exterior criterion of such spiritual things, and most certainly you cannot teach them to the modern German in a short campaign. Still less can you accept some paper guarantee that his soul has changed.

(2) That his lines are impregnable, and a decision against him impossible, is nonsense. His lines have been forced in place after place: because the job is not completed, is that a reason for giving it up? He is more and more in jeopardy; and he sees in his immediate future, defeat. To think negotiation necessary because he is our equal is to stop the fight in its last round. He has become our inferior. He is increasingly our inferior in material strength.

(3) Lastly, this cry for particular details of peace—(an enemy cry, remember)—always presupposes *his* terms, not ours. It is always what he will concede, not what *We* shall impose, that is the matter of this ambiguous discussion. There is a pretence of arbitration—but it is a false pretence. His apologists (for so those are who propose a negotiated peace) invariably state the best case for *him*—never the general case between him and ourselves.

All this demand for detailed discussion *with him* may, then, be neglected.

But there is a deeper and more serious consideration.

The Allies, under God, will conquer in this vast business. We shall (under God) impose our terms. These are general conditions, not of a negotiated peace, but of victory.

To these conditions of victory I will next turn.

(To be Continued).

H. BELLOC

Germany in the Baltic

By L. Cope Cornford

GERMANY, in attacking the islands lying to the north of the Gulf of Riga, presumably reckoned upon the inaction of the Russian Baltic Fleet; and if she did, she was justified by the event. There are few instances in history of a squadron covering, without being attacked, the landing of troops on hostile territory within some twelve hours steaming of a powerful hostile fleet. By all the rules such an achievement should be impossible; but the rules do not provide for the complete immobilisation, due to secular reasons, of the aforesaid fleet. It does not appear that the German force consisted of more than one battle squadron with a large number of light craft and auxiliaries; a force with which the Russian Baltic Fleet should be able effectually to deal. Apart from the small and miscellaneous Russian squadron stationed in the Gulf of Riga, the Russian Baltic Fleet for practical purposes did not exist.

A little more than two years ago, and again in 1916, the German Fleet attempted to force the Gulf of Riga and was beaten off with some loss. Presumably the Irben Channel, the Strait leading from the Baltic into the Gulf, was subsequently mined; and if it was mined, either the mines must have been allowed by Russian neglect to go adrift, or the German minesweepers must have cleared them without interference by the Russians.

Control of the Gulf

The result of the German naval operation, so far, is that the Germans occupy the whole or nearly the whole of the three islands—Oesel, Moon, and Dago, making the northern barrier of the Gulf of Riga. From Oesel they can establish communication with the mainland across the narrow and shallow channels running on either side of Moon Island, and thence to Hapsal, which is railhead. According to both German and Russian statements, that proportion of the Russian naval forces in the Gulf which has not been wrecked, sunk, or destroyed, has retreated northwards; so that the Germans now control all the waters and the coasts of the Gulf of Riga.

Germany can now supply her army in this region by sea through the ports of Riga and Pernau, both of which are railheads, and both of which are set at the embouchure of rivers. Within the Gulf the German Fleet can ride secure. The Irben Channel can be shut against both ships and submarines; and Moon Sound is not practicable for ships of deep draught, and can be blocked. Indeed the Russians claim to have sunk the battleship *Slava* for that purpose; although in keeping the German light draft out of the Sound they also kept out their own vessels, and so severed communications with the Gulf of Finland. In the winter, the Germans can keep clear with icebreakers waterways from the Baltic to the Riga ports.

Regarded as a naval operation, the capture and occupation of the water and the littoral of the Gulf of Riga was completely successful. The feeble resistance of the weak Russian forces was speedily overcome. Germany has long since dominated the Baltic, and her most recent enterprise extended that domination. She has gained a valuable naval base at Riga, and a less important but extremely useful base in the shallow harbour of Pernau. Germany now holds the whole line of the communication between Kiel and the Riga ports.

It is too much the fashion in this country to underrate the achievements of Germany; nor does the fact that in the case under consideration Russia could have prevented the invasion, affect the result. So long as the Russian Baltic Fleet is paralysed, the German position in the Gulf and in the Baltic is secure; and should the Russian Fleet be restored to discipline and become fit to fight, it will find it much harder to get Germany out of a fine natural harbour than it would have been to stop her entrance into the Gulf. That Germany should have won additional naval bases is far from satisfactory to this country; whose difficulties chiefly arise from the fact that Germany cannot be ejected from the naval bases she already possesses.

Nevertheless, it is not to be forgotten that while the Russian Baltic Fleet remains undefeated, the control of the Baltic exercised by Germany is conditional. It is also true, in the abstract, that so long as the British Fleet remains undefeated Germany exercises such restricted action at sea as she can compass upon conditions which cannot be permanent. But as matters stand, it does not appear that the argument is of immediate practical application. Moreover, the converse aspect is equally true: so long as the German Fleet is un-

defeated, so long can it control the Baltic and also exert what is called a covering influence over submarine and commerce-raiding operations. And no one has yet explained how to defeat a fleet which obstinately remains behind land batteries and minefields.

The most recent information indicates that the Russian naval forces in the Gulf of Riga were taken by surprise, fought a confused and losing action in which a battleship and a destroyer were lost, and then retreated. The Russians estimate the German losses at two battleships, one cruiser, twelve torpedo boats, a transport and some mine-sweepers, but adduce no evidence in support of their statement. The only German losses actually ascertained to have occurred during the attack consist of six or seven torpedo-boats.

But a despatch received from Petrograd on October 22nd records an attack made upon the German Fleet by a British submarine, in which a German battleship may have been hit, and a transport is stated to have been put down. In brief, the only substantial damage inflicted upon the German squadron was the work of a British submarine. There is naturally some speculation in this country as to the possibility of British intervention in the Baltic; but it is obvious that no information on the subject can be made public. It is a question involving considerations of high strategy, with which the War Staff at the Admiralty is alone competent to deal.

The extended control of the Baltic by Germany is likely to affect the position of Finland, where German influence is very active. Sweden is also directly menaced. Germany now exercises her control right up to the Aland Islands, at the mouth of the Gulf of Bothnia, a zone which includes all the important Swedish ports. So far as Sweden is concerned, she is now wholly dependent upon Germany for the use of her sea communications; a humiliating and a dangerous situation, the inevitable result of permitting German influence to dominate the Swedish Government. There can be no neutrality in this war. Every country must be for the enemy of civilisation, who has violated all international law, or against him. And those who, by reason of force, or fear, or commercial greed, are for Germany, will either be put under the feet of Germany, or share in her punishment.

There can be no peace in Europe nor any security at sea so long as Germany holds the Baltic.

It is not the purpose of this article to treat of the military aspect of the German occupation of the Riga district. What has happened is that the German Navy has forced the backdoor into Russia. Reval can now be attacked from the landward side, and Kronstadt no longer defends Petrograd. How the German army propose to use their advantages is another question.

The Political Aspect

There remains the political aspect of the affair to be considered. It has been said, with truth, that the Riga expedition was partly inspired by the necessity of employing a mutinous navy. That the mutiny occurred is certain; that it was much more serious than the German Minister of Marine would admit is certain; and that it was due, not chiefly to the infection of Russian revolutionary ideas, as Admiral von Capelle told an incredulous Reichstag, but to the drafting of the sailors into the army, to short rations, and to monotonous work under remorseless discipline, is also certain. The date upon which the mutiny broke out has not been stated; but the date of its announcement by the Minister of Marine coincided with the eve of the departure of the squadron to Riga. At that time, according to the Russian statements, the sailors of the Russian Baltic Fleet were diverting themselves by holding revolutionary meetings at Helsingfors, and very likely they were hailing the adhesion of their German brothers to the sacred cause. The Soviet sent to them "an appeal"; but it was too late; and the next thing the Russian Fleet knew, the German guns were bombarding Arensburg. In war, what is required is not an appeal but an order. A society in which there is no one either to give an order or to obey it, is ready meat for the destroyer.

It is also doubtless true that after the mutiny it was necessary to restore in Germany the highly dilapidated reputation of the Imperial German Navy; and to that end, an easy success in the Riga direction was indicated. The success has been obtained, and probably the reputation has been mended. All these things worked together in a combination, together with the raid in the North Sea of October 17th, and the attacks upon this country from the air.

But the fact that an enterprise was partly inspired by

political motives does not decrease the value of its success. Why Germany did not attack the Gulf of Riga earlier in the season is not clear. It may be that the German agents in Russia, who control the Soviet, which controls the Provisional Government, considered that the right moment had not yet come. Or Germany may have preferred to wait until the season was so far advanced that military operations, involving the extension of lines of communication and a diversion of force, being impracticable could plausibly be postponed;

while in the meantime the threat to the capital might intimidate Russia towards the acceptance of that separate peace for which the German conspirators in the Soviet are intriguing.

But these are matters of speculation. The substantial facts are that Germany has gained a valuable naval position, and that so far as immediate action is concerned, the Russian Baltic Fleet has shown itself to be useless.

Germany has once more proved herself to be never more dangerous than when she is talking peace.

Prince Henry of Prussia

By J. Coudurier de Chassaigne

PRINCE HENRY of Prussia belongs, like the Baron von Kühlmann, to that little group of Pan-Germans who circulate round the Kaiser. Some of them are in the confidence of their Imperial master, and are even on occasion consulted by him, though the advice they give is rarely ever followed by that capricious genius who invariably resents any apparent encroachment upon his All-Highest authority. Like the majority of His Majesty's intimate friends, these secret counsellors are almost unknown outside their own country, though, as the hour of victory for the Allies draws nearer, it is possible that one or two of them may emerge from the twilight of Court intrigue if only to repair some of the errors committed by the Party of "frightfulness." And in view of this contingency it is important that we should understand something of the character and capabilities of these wolves in sheep's clothing.

The most remarkable among them are the Baron von Kühlmann, whose psychology I have already tried to analyse in these pages, and Henry of Prussia, the only brother of Wilhelm II.

Still in the prime of life at 55, Prince Henry is certainly one of the most sympathetic personalities at the Prussian Court. As Baron von Kühlmann symbolizes the virtues and vices of the middle-class magnate recently ennobled, so Prince Henry is the incarnation of the qualities and defects of the Prussian aristocracy. He possesses that unaffected simplicity of manner which renders him easy of approach to men of all classes, added to a fine physique. His keen eyes indicate both vigour and penetration, and seem to fix themselves upon the person to whom he is speaking as if to read the thought behind the words. But in spite of his amiability, Prince Henry has none of the impulsive enthusiasm so characteristic of his brother the Kaiser. He gives one the impression of a man who never lets himself go beyond the dictates of a cold and clear intelligence. Briefly, that German expression *richtige Mensch Führer* (a real leader of men) admirably describes Prince Henry of Prussia.

It may be that this austerity of life and character is the result of rigid discipline imposed by the Empress Frederick upon her sons during the days of their youth. A daughter of Queen Victoria, their Imperial mother had the strict views on the subject of education which were then prevalent in England. The two boys responded very differently to this somewhat drastic moral training. The elder, William, violently rebelled against it; indeed his hostility towards his mother was so marked, both before and after his accession to the throne, that he scandalized even the enemies of the English Princess, and they were many. The younger Prince, Henry, was on the other hand a model son, and seems to have adapted himself with comparative ease to the austere habits of his parents. By nature he was ready to accept that ordered existence, and that sacrifice of self which is the basis of military and also of naval discipline. Being the second son, the Imperial Navy was his lot. Energetic and endowed with a great capacity for work, his heart has always been in his profession, and to become by his own merit the best officer in the German Navy has been his principal ambition. To-day Prince Henry may be said to have realised that ambition, for he is undoubtedly one of its most remarkable engineers. For him the art of navigation has no secrets. He is acquainted with its theory as well as its practice. His hands with their spatulate fingers are in fact the characteristic hands of a manual worker, strong, nervous and amazingly dexterous. When on a tour of inspection he insists on examining every corner of the ship. Clad in the over-all of the simple sailor he verifies himself every detail of the machinery.

When on land he consecrates a great part of his time to the study of those patents which either directly or indirectly affect ocean or aerial navigation. Thanks to his wide technical knowledge, he is able to understand and to appreciate the possible importance of any new discovery. In order that no invention of potential value to the Fatherland may escape his control, Prince Henry used to spend hours in questioning and encouraging any inventor who sought his help and pat-

ronage. He made himself in effect, a kind of Minister of Inventions.

In this connection it may be worth explaining the German policy in regard to patents, which served so well the economic expansion of that country before the war. With the object of persuading inventors, all the world over, to take out German patents, they were offered advantages such as no other State gives them. In England as in France, when an invention is patented, only a superficial examination is made of its claim to originality. Our patents are in reality scarcely more than a record stating, that upon a certain date the formula of such and such a contrivance has been deposited. It is only when this patent is infringed or stolen that the inventor is called upon to prove in a Court of Law the absolute originality of his idea.

The German Patent office, on the contrary, refuses to register a patent until the inventor has demonstrated that his machine can do what no machine has ever done before. This established, Germany will guarantee him protection against any plagiarist. But this policy is in reality designed to obtain such practical and technical details as will enable the Berlin Inventions Bureau to pick the inventor's brain. As a result, the latter gets his patent, while the experts in the pay of the Government get not only a new idea, but also its practical realization, which in a modified or even an improved form can be materialized by a German engineer for the benefit of the German Empire. Herein lies both the value and the danger of a German Patent. One can understand moreover why Prince Henry, always keen to keep pace with the discoveries of modern science, should have specialised in this study.

In justice to this scion of the Hohenzollerns, one must admit that he is not only an accomplished technician, but also a man of parts and imagination. Was he not the very first in Germany to comprehend the importance of the patents taken out by Count Zeppelin when he started to make the conquest of the air?

At the time when the Kaiser, and all the experts in Germany, as well as in France and in England, dismissed the Zeppelin airships as useless and expensive gas-bags, Prince Henry had the courage to declare himself the champion of the old inventor. Even then he realised that, apart from the military uses to which these air-ships could be put, they might become instruments of international blackmail as well as the eyes of the High Seas Fleet.

In 1905, when Count Zeppelin terminated his first dirigible destined for the German Marine, Prince Henry exclaimed as he went on board at Friedrichshafen: "This is not a balloon, it is a real airship." So saying, he at once took command of the new monster on its trial trip round the Lake of Constance. Though a thick fog made its navigation extremely difficult, Prince Henry accomplished the journey, including a passage over the Alps, in a little more than seven hours, and guided by the sound of a bell attached to the landing place, he brought the airship to earth close to Count Zeppelin's shed. That this feat demanded courage, as well as skill of no common order, is undeniable.

The spirit which inspired Prince Henry on this occasion is the spirit of patriotism which has directed every act of his life, for he is above all a patriot, and a Pan-German, to whom no effort is too painful, and no risk too great, which may hasten the realization of the national idea.

Prince Henry has, like all real workers, a horror of "pomp and circumstance." With his brother's passion for theatrical display, he has no sympathy whatever, preferring the laborious and methodical existence of a naval officer on active service. He lives in the Palace at Kiel, in the bosom of his family, going early to bed and rising with the sun to work in his library. His table is frugal as becomes a sailor who enjoys perfect health, and he prides himself on keeping in the pink of condition.

The value of the submarine as a destructive weapon to be used equally with the airship for threatening Germany's economic rivals, was apparent to the Grand Admiral ten years ago. About that period one of my friends, who is an inventor,

had a long conversation with Prince Henry at Kiel. When they had finished talking, his Royal host drew him to a window which overlooks the town and said: "That church and all those houses you see upon the hill-side, will shortly be pulled down to make room for the new yards where we are going to build submarines."

Besides his knowledge of and devotion to all things pertaining to the German navy, Prince Henry occasionally undertook diplomatic missions at the request of his brother the Kaiser. Some of the Royal tours attracted the attention of the world, notably the Prince's visit to South America and to the United States, the object of which was undoubtedly to convince the Teutonic colonists scattered over the Western hemisphere that the Fatherland did not mean to lose sight of its distant subjects, upon whom it relied for the spread of Pan-German propaganda.

The Two Brothers

These missions, which included several cruises through Pacific waters, were no joy to Prince Henry. He regarded them as inevitable but tedious duties, only undertaken at the insistence of his Imperial brother, with whom his relations have not been invariably cordial. The following story is an illustration of occasional differences of opinion between them, and also throws a curious light upon the character of the Kaiser. A few years before the war, the necessity arose to nominate a new Admiral of the Fleet. The Kaiser apparently hesitating between two candidates, sought counsel of his brother. The latter strongly supported one of the officers in question, giving at the same time all his reasons for preferring him to the other. The Kaiser listened in silence to Prince Henry's advice, and they went off together to an official banquet where the promotion was to be announced. In the middle of the dinner, Prince Henry, as if, fearing that his brother's memory might fail him, sent him on a piece of folded paper the name of his favourite. The Kaiser, reading it, smiled an acquiescence, but this gesture did not however prevent him from proclaiming at the end of the repast the name of the other candidate, as having been promoted to the rank of Admiral. It took Prince Henry a long time to get over the incident, but ultimately his sense of duty to the Imperial cause forced him to forget his private mortification.

Some such feeling of patriotism was doubtless responsible for his numerous journeys to England, much more numerous in fact than the British public realised at the time. When discussing Prince Henry, some time ago, with an eminent politician, he surprised me with the remark: "You don't know then that Prince Henry had a great admiration for an English lady, whose name, by the way, I never knew. There, no doubt, lies the reason of his frequent visits to England."

I am inclined to think, however, that the charming Dulcinea had neither name nor existence. Such a legend would furnish an excellent means of stifling any suspicion which the Prince's presence in England might arouse. Nor would it be the first time that amorous intrigues have been invented as a cloak for secret political designs.

What is certain is that Prince Henry, well informed upon everything that touched the British Navy, often served as the discreet exponent of the German point of view. I will cite a typical instance of this, which happened in 1910, about the end of February. On that date Prince Henry was in London and the following conversation took place between H.R.H. and an influential personage in London society, with whom he was on terms of friendship. In the smoking room, after dinner, Prince Henry suddenly turned towards his host and said: "My dear X., why is it that we cannot get on?"

X., taken aback, took refuge in generalities about bad feeling engendered by the Press and commercial rivalry. But the Prince, shaking his head, replied: "No, no, that won't do."

Whereupon his host, feeling that the moment had come for frank explanation, remarked bluntly that it was no wonder a sentiment of suspicion had been aroused in England by the enormous additions to the German Navy. As these ships were not required to fight France or Russia, we were justified in assuming they were intended to fight England.

In an excited voice, Prince Henry declared that nothing was further from the intentions of Germany than a war with Great Britain.

"We have now," he added, "forty years of peace behind us which has permitted us to become a nation. Before that we had been fighting for over a century, and most of the battles in the Napoleonic wars took place on German soil. Now that we are beginning to prosper peacefully what object could we have in going to war with you? We have nothing to gain by it, and in any case it would cripple and probably destroy our trade. Why cannot your people understand that Germany only wants to defend her commerce? As for the plan for invading England, we have none; nor in my opinion is such a thing possible. How, will you tell me, could we

send transports full of troops as long as there is even one submarine afloat?"

X. thereupon indicated that although Germany's intentions might be pacific, she must see that her immense Navy threatened our national existence. With practically no army, England should, were she to lose command of the seas, lose also all her colonies, and her independence as well.

"As long as Germany continues to build," he added, "we are bound to do the same. Where is it going to end? Naturally, the increased taxation is being felt by all classes in both countries, and the middle class on whom it presses most heavily, is told that the other's Naval programme renders it essential."

"I can only tell you," answered Prince Henry, "that this feeling of suspicion and distrust simply does not exist in Germany. Two years ago, in order to show my confidence in England, I took the whole High Seas Fleet to Gibraltar, and then to Madeira, staying away two months. In spite of this, you still insist on massing the whole British Fleet at Dover! Why? I have asked McKenna, who says it is done from motives of economy. Perhaps you will tell me the real reason?"

"Surely, Sir, you don't think a fleet is kept for pleasure, or for digging potatoes! No! you know as well as I do that it is kept for one purpose, and that is war. It's only common sense, therefore, to mass it at the point where it is most likely to be needed."

This remark seemed to amuse H.R.H., who laughed and retorted: "You're really the first person who has dared to tell me that!"

His host then pointed out that we did not take the fact of Germany's having made all arrangements for fighting on the Russian frontier as implying any intention of going to war with Russia.

"It's only common sense," reiterated X. "to make the best possible disposition in peace of forces intended for war."

Prince Henry agreed with this view, but protested that in Germany this action was construed as a direct preparation for hostilities.

"A lot of our people have a fixed conviction that England would smash the whole German Fleet at the slightest provocation. At present, whatever you say, we are at your mercy. All we want is to be able to cry 'Hands off!' If any difference of opinion comes up between us, as happened at Algeciras, we have to take what you dictate lying down. We study European history, and we know that whenever any European Power rose to predominance, England has smashed it. Look at the Dutch, the Spanish, and later on the French. We do not mean to let Germany follow their example. That's all!"

This conversation made such an impression upon X., that meeting Mr. Asquith on the following day he mentioned it to the Prime Minister, who told him that Prince Henry had requested an interview for the avowed purpose of discussing the relations between the two Powers.

X. then related the conversation of the night before; whereupon the Prime Minister expressed the hope that the Grand Admiral would not be so outspoken with him, as it would be necessary to reply with unpalatable truths.

But, as I learnt a few days ago from Mr. Asquith himself, Prince Henry confined his remarks on the occasion of their interview, to vague generalities, so vague that Mr. Asquith, whose memory is known to be unique, has no definite recollection of what passed between them.

What is the true significance of this outburst of candour with X. followed by such unexpected reserve when talking with the Prime Minister?

Was Prince Henry sent on this occasion by the Kaiser to throw dust in the eyes of the British Government?

Did the straightforward answers of his friend X. demolish the arguments put into his mouth by his brother? Or was he simply expressing a genuine personal opinion, and having failed to convince X., did he consider it useless to propound the same thesis to the Prime Minister?

I am inclined to adopt the latter interpretation of this extraordinary dialogue, and for the following reasons. To regard the German Army and Navy as a means of levying economic blackmail upon the other nations of Europe is part of the programme consistently advocated by that inner circle of Pan-Germans which includes both Prince Henry and Baron von Kühlmann. Both have ever preferred armed menace to military action, and both place economic above political advantages.

That is why I regard these men as two of the most dangerous and plausible enemies we shall have to face in Germany when the purely military leaders are discredited.

At this moment when the possibility of a premature peace is being discussed in so many different directions, we must be more than ever on our guard against the hidden activities of those German politicians who have always been clever enough to realise that the economic factor provides, after all, the most powerful lever to world supremacy.

The Choice for our Children

By Jason

THERE is perhaps no better test of the spirit in which our imagination reconstructs our society than the test afforded by an Education Bill. At this moment the discussion of Mr. Fisher's Bill is overshadowed by the immense issues hanging on our military operations. The war leaves us little time to think of anything but the means of victory. But the main lines of debate are becoming clearer to those who have noted what was happening as Mr. Fisher made his tour of the Industrial North. The country has to choose between its duty to the children of the race, which means much more than some millions of boys and girls alive at this moment, and the demands of certain economic interests which suppose, wisely or foolishly, that they will suffer if the existing supply of child or adolescent labour is reduced.

That is the plain issue. Not, of course, that these interests are a solid group of employers. They do not include all employers by any means, nor do they include only employers. The *Cotton Factory Times* represents workpeople, and it has already struck a note of warning, powerfully reminiscent of the language and arguments of the opponents of factory laws a century ago. The delicate health of the cotton industry is to many a reason to-day as it was then for refusing to let children have a decent share of the daylight for their own minds and bodies.

It is worth while to glance at the history of the controversy which is now passing to a new stage, for it is significant and instructive. A Member of Parliament who proposes to speak in the debates on the Minister of Education's Bill, might do worse than spend a few hours over Hansard, recalling to his memory and imagination the scenes in which the Peels, Sadler, Ashley and Fielden took part. He will see that the arguments by which each reform is resisted repeat the arguments that were used against the reforms of the past. There is a good story told about a set of people whose produce had been commandeered by the Government during the war on terms that seemed to them at the time quite ruinous but proved in point of fact exceedingly profitable. These same people produced other goods, which the State some time later found it necessary to commandeer, and at the first mention of a price they hastened to London to protest that they would be ruined. In the meantime, there had occurred a reshuffling of Government departments, a not uncommon experience during war administration, and it happened that when the gentlemen arrived with bankruptcy on their faces, but very comfortable profits from the last transaction in their pockets, they were shown into a room in which they saw on the other side of the table the very officials to whom they had communicated the depressing forebodings about their fortunes a few months earlier. Somehow the protest was not quite as convincing as they had hoped to make it.

If the ghosts of the House of Commons a century ago could listen to our debates to-day, they would have the same argument that the industry would be ruined which had done such energetic service against the Factory Acts in their turn. And they would note that in spite of the ruin which was to follow on the Factory Acts these industries were still prosperous and powerful, though still inclined to be unduly anxious about their health.

This argument was used from the first when reformers ventured to remove some of the most revolting scandals of the Factory system. It reappeared with every slight extension of those reforms. An interesting survey occurs in a speech by Mr. Brotherton, the Member for Salford in 1836:

We have it in evidence that previous to the passing of Sir Robert Peel's Act, the usual number of hours for which persons employed in factories was seventy-seven in the course of the week; and from returns on the tables of the house, it appears that it was not unusual for children of seven and eight years old to be kept at work as many as ninety-three hours in the week. Sir Robert Peel's Act reduced the number to seventy-two in the week; and when this was done, the legislature was told by those who professed to understand everything connected with the subject that the possibility of our manufacturers continuing to compete with the manufacturers of foreign countries was completely taken away. But how was this assertion borne out by the fact? At the time of the passing of the late Sir Robert Peel's Act in 1819, the exportation of cotton twist from this country amounted to 18,000,000 lbs., and in six years afterwards the quantity annually exported was 45,000,000 lbs. The period of labour was again reduced in the year 1825 and the same argument was used that nothing but positive and immediate ruin could fall on the heads of the devoted manufacturers of this country. What was the fact? In the year 1834, the exportation of cotton twist amounted to 76,000,000 lbs.

The men with whom Brotherton was trying to reason in this

speech, honestly believed that our manufacturing prosperity depended on child labour and low wages. They were well represented by George Phillips, a Lancashire Member of Parliament, who declared in 1818 that

The low rate at which we had been able to sell our manufactures on the Continent, in consequence of the low rate of labour here, had depressed the Continental manufacturers, and raised the English much more than any interference could do: if the legislature interfere now, they would depress the English and raise the Continental manufactures.

It is easy to see how men who believed this came to believe that industrial progress involved human degradation.

Shorter Working Hours

These men were wrong, even in the application of their own principles, as we know. They might have suspected that they were wrong at the time from the experience of Robert Owen, who had introduced a shorter working day at New Lanark. One of the opponents of factory legislation, Lord Lascelles, made a curious reference to Owen in a debate in 1818. The Bill, he said, "really had its origin in a gentleman who had for the last twelve months made much noise in the public prints. He meant Mr. Owen. . . . It formed a part of that system of moral education which was projected by that individual in the management of this branch of trade who said that from his own experience at Lanark, the reduction in the hours of labour, so far from diminishing the general produce of the factories, rather tended to increase it." Lord Lascelles was himself quite bewildered by this proposition but, of course, it seems less of a paradox to us than it did to him.

All this reasoning started from the needs of industry and put human destinies in a strictly subordinate place. But there were men, even in the demoralising atmosphere of the economy of the times, who refused to accept this order and insisted on thinking first of the needs of humanity. It has always been a characteristic to our history that abuses have found fearless judges, a fact recognised by so bitter a critic as Karl Marx, who explained in the introduction to his work on Capital, that if England supplied the classical example of the exploitation of the working classes in the Industrial Revolution, the reason was partly that there had always been Englishmen ready to denounce abuses and demand inquiry, and that if there had been the same spirit in Germany, Germany would also have had Parliamentary Committees reporting on the scandals of the factories:

Who is the real hero of the revolt against the factory system? There are many whose names ought to be inscribed, as Thackeray put it, on the dome of St. Peter's for all the world to read. Shaftesbury, Sadler, Oastler have won immortal fame, and there are many others, parsons, manufacturers, public men, and workpeople whose names have been forgotten. But among all there is perhaps no nobler figure than that of John Fielden, the author of *The Curse of the Factory System*, and Cobbett's colleague in the representation of Oldham. For Fielden was himself a manufacturer, one of the largest cotton spinners in the world. In 1836 when opposing a Government motion to repeal a clause in the Factory Act of 1833 and so to enable children between twelve and thirteen to work full time, he gave an indignant answer to the appeal to the manufacturers:

Again the House is told that the manufacturers would suffer by yielding to the noble Lord's amendment. This is the worst appeal that could be made to the House: for I am sure that if there is a spark of humanity in it, the House will never set private interests against the life and happiness of these poor little overworked children. At any rate I, as a manufacturer, and a large one too, will say that I would throw manufacturers to the winds rather than hesitate upon such a point for a moment.

The Government Bill passed its second reading by 178 votes to 176, but the division was a moral victory for the opponents and the Bill was withdrawn. Carlyle put Fielden's view in *Past and Present*:

"What is to become of our cotton trade?" cried certain spinners when the Factory Bill was proposed: "What is to become of our invaluable cotton trade?" The humanity of England answered steadily: "Deliver me these rickety perishing souls of infants and let your cotton trade take its chance." God Himself commands the one thing: not God especially the other thing. We cannot have prosperous cotton traders at the expense of keeping the Devil a partner in them.

We can see to-day that the supporters of child slavery were frightening themselves with a bogey. At Todmorden there

is a statue to celebrate Fielden's services to the cause of the Ten Hours Bill erected by the workpeople of Lancashire. Nobody thinks now that Fielden's exertions were injurious to the manufacturing interest in its competition with Germany and France. Let us keep this example in mind in considering the case for a further reform to-day, and let us beware of allowing a nightmare to frighten us from the path of humanity. There are many manufacturers who are quite ready for such a reform of the industry as will secure decent opportunities to the boys and girls engaged in it; there are many workpeople bolder than the *Cotton Factory Times*, for a working class educational association in Lancashire has petitioned Mr. Fisher to improve his Bill and to provide not eight hours a week but half the week for books and games. It is not a conflict between the friends of education and the manufacturing community; it is a conflict between two views, two sets of principles, and the two views do not follow any such strict lines of demarcation.

There is one important difference between our situation to-day and the situation of our grandfathers. At that time there was a prevalent belief, inspired originally by the general interpretation of the teaching of Malthus, that our danger was over-population. The wars of Napoleon were not destructive of life in these islands on any large scale. The population of England and Wales increased by over 40 per cent. between 1790 and 1811. The reasoning of the age was governed by this obsession, this dread that there would soon be more mouths than food. At this moment almost all Europe is suffering under the greatest calamity that can befall the race: the extinction of its youth. Death is striking at all that is best, most vigorous, most full of life and energy for the future of the nation.

War's Ravages

No man can measure the ravages of the war. It is as if another Black Death had visited Europe, sparing the old and the weak, and singling out the young and the robust. Let there be no mistake about the price that is paid. Conceal and disguise it as they may, the boys who return from the front, with a new seriousness and a certain haunted look in their eyes have lost for ever something of the atmosphere of youth. And this premature loss of the spirit of youth is inflicted by the nation on itself every time that it buries a boy and girl in the industrial system, taking them away from all the natural and buoyant conditions of life that are essential to their growth.

This then is the question before the race to-day. Are we going to give the youth of to-morrow the opportunity of developing their minds and their bodies, of growing into strong healthy and happy men and women, or are we going to say that some law of economic predestination has assigned all this population to a special fate, the fate of serving industry to the eternal loss of their own faculties? Let any man or woman think of the question as affecting his own child. Let him read Sir George Newman's report as if the million of children whose lives are wasted from bad conditions of living were not the children of the people whom he never sees, but the children of himself and his friends. Let him ask himself whether he would be satisfied if his boy instead of spending his time from 14 to 18 at school with long hours in the open air, games and friendships was swept away into the factory or the mine for the livelong day, turned into a rivetter's boy or a bobbin boy or a van boy, or a messenger boy, working long hours with scarcely any recreation, as if neither his mind nor his body needed education or the nourishment of games and rest and air. How many parents in the comfortable classes would hesitate about their choice? But if their own minds are made up in the case of their own children, they are clearly satisfied that if you are considering only the good of the child, his prospect of mental and bodily growth, the future of his health and happiness, it is much better that a boy should go on being educated after 14, and that he should play games and develop his muscles and his limbs.

Now the nation should look upon every child in this connection in the spirit in which the parent looks on his own child. For the nation as a whole it makes an infinite difference whether the men and women of the future are well-educated and developed. In this sense the nation of to-day has in its hands the making of the nation of to-morrow. All the nations start with the havoc caused by the war and any "forward looking man" considering what his nation will be like fifty years hence will do to-day what a doctor implored our grandfathers to do in the early years of the factory system and consult "vital" rather than "political" economy as the canon of wisdom. What a different people we should have to-day. How different our towns, our industries, our homes, and our healths—if our grandfathers had listened to him!

Some will say that this is all very plausible but that to provide that every boy and girl shall have half his or her time

for education and games up to 18 means an immense social revolution in which industry will suffer and poor parents will suffer. The answer surely is that the war has brought a revolution, and that even if we leave the law exactly as it is, industry has to adapt itself to new conditions. There have been vast changes in the structure and details of industrial work during these three years. Who would have supposed three years ago that our industries could carry on at all with five millions of men withdrawn from productive work? Are we to be told that they will be permanently crippled if the boys and girls available between the ages of 14 and 18 are reduced by one-half?

Every industry will have to take stock of its new position at the end of the war. If new difficulties have arisen, new sources of power and energy have been discovered. Many boys and girls are doing work that must be done, but nobody supposes that a great industry like the cotton industry will pull down the blinds because it has fewer boys and girls to employ. The effect will be, of course, to introduce another element into the problem of reorganisation. If there are fewer young tenters, and young piercers, the industry will have to pay better wages to grown-up workpeople. All industry suffers from the employment of boys and girls on a great scale, because wages are depressed and men and women are driven into other occupations. The boy who becomes a full-time wage earner before he has half grown up, will give place thirty or forty years hence to another generation of victims of the custom that is robbing him to-day of his right to the full development of his mind and body. Partly the problem will be solved by the introduction of machinery such as mechanical "doffers."

So far as the work which is being done by young boys and girls is necessary work, it will be done in part by boys and girls (for a half-time boy of 16 would be often more productive than a whole time boy of 16), partly by grown-up men, partly by disabled soldiers, and women, partly by machinery, and the effect, of course, will be to add enormously to the industrial power of the nation, for education and health are sovran elements of strength.

But a great deal of the work done by these boys and girls is not necessary to industry: the selling of papers, the running of errands, many and other miscellaneous occupations which absorb boys and girls for a few years of life and then throw them on to the world without experience or training of any value. Still, it will be said, these boys are helping to keep a roof over many a widow's head. What are you going to do with the homes which depend on their earnings? It would be infinitely better to subsidise directly every person who has to depend on the earnings of those children than to allow this process to continue indefinitely, and to keep generation after generation in this vicious circle. These children will not cease to earn; it is even doubtful whether their earnings will be much reduced. Their parents suffer. They must be compensated, but in time of course the earnings of the parents will rise in consequence. Moreover, it is coming more and more to be recognised that the living wage must mean a wage that makes a man independent of his children's earnings. In this, as in many cases, the bold policy is the safest.

Mr. Fisher would do well to follow his own inclinations as an educationalist and to allot to education more than the mere eight hours a week for which he asks in the Bill. Eight hours will not go far if they are to include games, camp life, physical training, as well as education in the narrower sense of the term. Let him ask the nation to make a great bid for the power that belongs to a society which develops its highest resources, for the happiness that men and women can obtain, the strength of the body and the pleasures of the mind. The Government have announced that they cannot find time for Mr. Fisher's Bill this session. This will not be an unqualified misfortune if advantage is taken of the delay to continue the process of educating the country and also to improve the Bill. It is quite possible that to provide for half-time at first perhaps to 16 and then to 18 would be less of an interference with industry than taking merely eight hours a week.

All the tendencies of the age point to a new and nobler conception of industrial life in which a greater and more responsible space will fall to the men and women who are now too often merely part of a great machine. An educated industrial democracy will provide the energy and power that are needed to give to such associations their hope of success. For the moment certain industries will have to suffer the inconvenience and the trouble of revising their arrangements, but is that too great a demand to make of them? Let us suppose that these boys and girls were wanted for the army, that the defence of the nation depended absolutely on their being withdrawn from employment for half the day, would the nation hesitate? Neither then ought it to hesitate when the need is not the defence of its shores but the defence of its future.

Alsace-Lorraine and the Rhinegold

By Philippe Millet

THE world is beginning to realise that the question of Alsace-Lorraine does not concern France alone but really dominates the whole war. With the possible exception of the restoration of Belgium, all the other war aims of the Allies depend more or less upon that one. We can never be sure that there will be no "next time," and the world cannot be safe for democracy unless Prussia is compelled to give up what she stole from France in 1871. From the point of view of right, this is obvious. It would be no use pretending that we stand for the right of the peoples to dispose of themselves if we did not begin by liberating the two provinces Prussia has conquered and is holding by force. But the liberation of Alsace-Lorraine is equally vital from an industrial standpoint; it is, I believe, the key to the economic policy we must enforce upon the world if we want to put an end to any sort of aggressive Imperialism.

I will try to make this clear, first by showing that the possession of Alsace-Lorraine is the economic basis of what we call Prussian militarism, and in the second place by outlining the economic changes which will result from the return of Alsace-Lorraine to France. Wagnerites will remember that the Prussian worm Father derived its power from the possession of a certain treasure named the Rhinegold, which the German gods, with characteristic Bismarckian unscrupulousness, had stolen from the unfortunate Nibelung. Now the Rhinegold actually exists. French Lorraine, with the adjoining Sarre valley, contains, besides an important coal field, the richest deposits of iron ore in Central Europe. Such is the treasure Prussia has succeeded in wringing from its legitimate possessor. The whole district was French in 1814. A year after, at the Vienna Congress, Prussia availed herself of Napoleon's second downfall to lay her hands on the Sarre valley. Then came the war of 1870-71. This time Prussia took hold of what she thought was the whole of the industrial wealth of Lorraine. She would have asked for Briey as well, had it been known at the time that Western Lorraine also contained important deposits. However, by far the best part of the Rhinegold has been in her hands for more than forty-five years. It is on that basis that she has built up the whole of her industrial Imperialism.

Let me quote here some figures. It is impossible to lay too much stress upon them: *Out of 28'6 million tons of iron ore which Germany extracted from her soil in 1913, 21 millions came from Lorraine. Out of 2,800 million tons, representing the iron deposits of Germany, the German engineers admitted that Lorraine alone contained 2,100 millions.*

What is the meaning of these figures? First of all, it appears that the Lorraine treasure has, for the last 45 years, been the main source from which German metallurgy has drawn its raw materials. But German metallurgy is not only the most important of all German industries; it is the very key to the whole of German industrial development, for it was by using their supremacy in steel that the Germans tried to dominate and had begun to dominate the markets of the world. Moreover Prussia has made of the Lorraine deposits a truly Prussian use. Suppose Lorraine had become British: there is little doubt that no efforts would have been spared to develop highly the district by opening it to the rest of the world. The coal deposits of the Sarre and the iron deposits of the Moselle being situated some distance from the Rhine, the obvious thing to do was to canalise both the Moselle and the Sarre and thus provide Lorraine with convenient waterways. The French had indeed started canalising the Moselle in 1867, and had secured in the Treaty of Frankfurt a clause by which the Germans undertook to proceed with the canalisation on German territory. But Prussia found it more conducive to her interest to develop Westphalia at the expense of Lorraine. She kept the ore for the use of Westphalian industry, but was careful not to dig a single waterway for the benefit of Lorraine, in spite of the fact that the cost was a trifling one.

In the second place, the iron deposits of Lorraine have played an even greater part in the prosecution of the war. This we know from the Germans themselves. On May 20th, 1915, the German manufacturers sent to the German Chancellor a secret petition in which they gave all their views about the subject. The passage of the memorandum concerning the *minette* (the name given to the special kind of ore extracted in Lorraine) is worth quoting at full length:

The manufacture of shells requires a quantity of iron and steel such as nobody would have thought of before the war. For shells in grey cast-iron alone, which are being used, when no superior quality is required, in place of steel shells, quantities of pig-iron have been required for the last months which reach at least 4,000 tons a day. No precise figures are available on this point. But it is already certain that if the output in iron and steel had not been doubled since the month of August,

the prosecution of the war would have become impossible. As raw materials for the manufacture of these quantities of iron and steel, *minette* is assuming a more and more important place, as this kind only of iron ore can be extracted in our country in quickly increasing quantities. The production in other territories has been considerably reduced, and the importation by sea even of Swedish iron ore has become so difficult that in many regions, even outside Luxemburg and Lorraine, *minette* at the present moment covers from 60 to 80 per cent. of the manufacture of pig-iron and steel. *If the output of the minette were to be disturbed, the war would be as good as lost.* (The italics are mine).

Here we have a candid confession of the truth. As Luxemburg only yields a small quantity of *minette*, it appears from the above memorandum that without the possession of Lorraine the German Empire would have been utterly unable to stand the industrial strain of the war for more than a few months. It is even probable that unless they had had at their disposal that enormous natural reserve of guns and shells, the Prussian Government would never have dared to go to war at all. One thing at any rate is certain, and ought never to be forgotten: out of every five shells the Germans have been strafing us with since the outset of the show, four, on their own admission, came from the French province which they had stolen in 1871.

Militarism's Corner Stone

In the light of these facts it is only too easy to perceive why Herr von Kühlmann seems so anxious to maintain Alsace-Lorraine under the Prussian yoke. There is little doubt that rather than surrender the conquest of 1871, he would be willing to part with half the territories belonging to Austria-Hungary, or even, if things did come to the worst, with Schleswig-Holstein. The reason for this is obvious: economically as well as politically, Alsace-Lorraine is the corner-stone of Prussian militarism.

Politically, Alsace-Lorraine has been since 1871 a mere tool by means of which the Prussian Government has managed to enforce both the supremacy of Prussia over the rest of Germany and the policy of armaments which led to the present war. It was because Alsace-Lorraine could only be held by force that the German people allowed the Prussian Junker, who has always been and always will be the living symbol of militarism, to sway the whole German Empire. So long as Alsace-Lorraine remains in German hands, Prussian militarism will have to prevail in Germany, whatever international formulas we invent at the Peace Conference in order to do away with the plague of armaments.

The same relations obtain between Alsace-Lorraine and Prussian militarism from an economic point of view. It was the Rhinegold of Lorraine which encouraged Prussia to aim at dominating the world, first by peaceful penetration, and afterwards by force of arms. The famous saying that war is with Prussia a national industry finds here a remarkable illustration, for modern wars as well as the disguised warfare called commercial Imperialism, is really an industry based on the possession of iron. Take from Prussia the iron of Lorraine she will be utterly unable to face the prospects of another war. You cannot manufacture guns and shells with anything but an unlimited supply of coal at your disposal. Without the stolen Rhinegold, Prussian militarism will be like a tiger without claws and teeth. If on the contrary the Allies were weak enough to allow Prussia to keep Lorraine or to accept a half solution which would enable Prussia to jump at the treasure and recapture it at any moment, then it may be truly said that nothing will ensure the future safety of the world.

Some are foolish enough to believe that the granting of a constitution to the German People would suffice to destroy the thing called Prussian militarism. They are apparently not aware that Prussian militarism is not a mere form of Government but a deeply rooted social phenomenon which no revolution can destroy in one day. Just as the French Revolution was followed by a reaction which lasted on the whole for more than fifty years, a German Revolution, if a genuine one did really occur, would not guarantee us that, say Hindenburg's nephews might not succeed after a few years in setting fire again to the whole civilized world.

It remains now to be seen what will be the economic result to the world at large of the return to France of such an immense mineral wealth. This question depends upon the general economic policy of France and the Allies. I shall endeavour to state what that policy will certainly be if we are sensible enough to think before all else how to maintain the future peace of the world.

(To be continued).

Jonathan

By William T. Palmer

RECRUITING work is always grim. One's military register may be, as this of mine, crowded with friends, neighbours, acquaintances. The casualty lists are daily making the survey of Army Book 414 an added duty. So many of the boys have "gone West." Here is an entry which arouses memories of happier days. "Jonathan . . . He's not "gone West." He is somewhere either in France, at Salonika, in Egypt or in Mesopotamia (if he is not shinning the peaks of the Tyrol with gunner comrades). Pen in hand I pause and recall him. Below-stairs the sergeant is wearily explaining some point about regimental posting, allowances, leave, medical examination. Probably a score of recruits put the question yesterday, and to-morrow a fresh score will demand the same information. There is a faint rustle of feet across the parade, a sleepy calling from the jackdaws who, despite the state of war, haunt the ancient fortress. There is the click of a typewriter, a phrase half heard as a door opens and shuts. My eyes turn eastward. Outside the castle wall is a fringe of lofty poplars, and behind them a dream of distant, grey hills. They are not interesting hills but mere hummocks of grass, yet to-day they serve to remind me strongly of Jonathan.

The ink of that entry is ancient. Jonathan passed beyond the Recruiting Office long ago. Every memory of him is linked with the fells. One sees again the buttress of clean sound rock. One threads again the line of ledges, steep gullies, narrow cleavages, exposed terraces and sensational traverses, and comes to that well-renowned point where the course gives out against a square block tilted to a slight overhang. Beneath this corner the rock face curves inward giving an airy sort of feeling. It's no place for the weak of nerve. Assault after assault at that twenty-foot corner had failed. The ledge disappears to nothingness; so without a base there was no chance of a human ladder like that which conquered the sheer rock-wall on Lliwedd and made possible the first storming of Walker's Gully on the Pillar Rock. The walls were too obtuse for "backing up." Handholds there were none; the rock seemed perfectly smooth. Failure! But not for Jonathan. Somehow he pulled his light form up the sheer crag, here welding his nailed boot-edge against some faint rugosity—no, friend Leo, it was not, as you state, balancing on a lichen or against a skin of moss—there clinging and hauling by some wee pit which gave warrantable hold for a finger-tip. It was a fine bit of climbing by inspiration; and even now, when the secrets of the great rock face are fully known, few storm that problem in the direct line of its first conquest.

A Daring Climb

Here is another memory of a daring climb. In the heart of Scafell is a tremendous rift, known to the clect as Moss Ghyll. The climbing of this begins curiously. It is a slant up a steep rock face, above which one burrows deep into the mountains, conquers cave-pitches and narrow clefts, to find the course peter out in a series of minor rents and rifts. One of these exits is famous for wet, unsound rock, for long runs on the rope, and up this Jonathan essayed to conduct a willing novice. But the rope provided was a mere fag-end, and again and again the leader had to help his follower up to an inadequate resting place in order that he himself might, by means of a second run-out, reach the head of the pitch. It was a dare-devil experiment, entered into because the alternative was no climb at all. And this the blood of youth could not tolerate.

One is hurled back to the reality of things to-day by the distant wail of a bugle, the drum of feet beyond the buildings. Probably it is Tommy's tea-time. The daws make a small flutter, then subside into sleepy remonstrance. Up in the sunshine is the faint dragonfly of an aeroplane. Here is the nation's work. My brief respite has been well and truly earned, but for a moment more one's memory flings back through the lowland sunshine to the golden blaze of September among the fells.

The air is full of gold and crimson; the wastes of bracken are minting the bullion of their year. There are golden beds and fringes of parsley fern, a droughted stream yields silver and diamonds as it splashes down the rocky dale. Nearer one's feet is a fan of scree, a few tumbled boulders, and overhead is a great outcrop of rock. Here it is smooth, unconquered, may be unconquerable; there it is a broken rampart tufted with heather, and though steep easy of access. There is too a great slash, broken by cross-terraces and

chockstones, where a tough little course is possible for the climber. Up the slabs and into the gully, into the cave and out over the stones which block and overhang, up the narrow chimney and along the slender ledge which gives access to a higher, steeper, narrower pitch, the little party goes steadily on. After a tough struggle the climb "goes." To Jonathan it is not new. A January day of snow and mist and pelting rain had shown him the way to victory.

Mountain Bivouacs

Memory ranges from the bivouac by a mountain tarn which, in a night of rain flooded the tent to a calm night when, after a long journey, camp had to be fixed in darkness unrelieved by the light of a single match. There were bivouacs too by windswept cairns and in plantations where the cold night draughts trouble one but little. There were long trudges over dull passes and down stony glens in twilight, midnight and dawn—hard gruelling nights preceding keen, strenuous days among the rocks. One must have been keen in those days when the crags were thirty miles away and neither cycle nor motor lifted us on the way.

Long before war-time Jonathan tutored us to the use of a rubber ground sheet, to an eiderdown bag in lieu of blankets, and to the tent cloth pegged flat to keep off the soaking rain. When good heather was available, one could dispense with the ground sheet, and so come nearer the simpler life. Scree we avoided; bog we knew; moss we hated; boulder, we tolerate—but every one of the Old Gang has gone to Flanders to make acquaintance with the general cussedness of mud.

* * * * *

The ground floor sergeant is arguing a point of officers' etiquette with his understudy. Their voices rise and fall, every word passing through my open windows. The assistant who is a new army man, believes that any way it don't matter as there ain't half-a-dozen swords in the whole depot—castle and camp together. At my elbow the telephone whirrs, is attended to, and relapses into cheerful silence. I turn again to the open register and to that entry "Jonathan" in healthy ink before me.

Jonathan went into queer quarters. One has seen him scrambling, wriggling along a broken ledge behind a waterfall. And there was a day of exploration in an abandoned mine. The first gallery smelled like, and was, a fox's haunt, but these vermin did not go far into the blackness. A ledge a score yards within was almost the limit of their pad-prints. In one of the great chambers the way was broken by a mound of loose fragments; surely it was ignorance that sent me up and over that pile. The danger was driven home by a collapse of rock while I was within, but the way of escape was not blocked. One had seen in a deep, ancient copper mine a corner of rock suspended on a timber prop so rotten with age and eaten through with the threads of fungi that the hand plunged deep into the mass with no more effort than forcing through a mass of soap suds.

But this afternoon one wishes for memories of the open air, and not of groping through ancient mines and caverns. We were on an open pass looking down a famous Yorkshire dale, and later passed along beneath Lovely Seat until among a reef of flat rock one noticed a rough building, not unlike a beehive in shape, entered by a creepy-hole and with another hole just above for light and ventilation. The interior was plenteously strewn with rushes. It was not for some minutes that the object of this erection was clear. In these wild countrysides foxes are too plentiful, the hills are full of impregnable "earths," and the gun has to be used to keep down the marauders. Therefore, on selected "beats," little covers of this sort are built, and in evening twilight and at dawn marksmen wait their possible chance of a shot.

I wonder, Jonathan, if in your bivouac, your hut or your dug-out, you ever talk of our marvellous quarters in the North Country—of Wasdale surrounded by the fells, of farms on wind-swept moor, and of a tiny Yorkshire inn, where, on a quiet evening you used to say that you heard the rumble of underground waters. Though I am looking out into the blue haze of late afternoon, my mind is of that wonderful night of starlight when the black peaks crowded round and hushed to silence the breeze and the moorland rills. I wonder whether, when you come back, you will have the old zest for the crannies of the hills. I fear that I shall not; those glorious rock climbs will speak too strongly of the men who have gone for ever.

The Serenading Party

By Etienne

"**S**IGNAL for you, Sir," said the Chief Yeoman, as with one hand he held a signal pad at exactly the correct distance from the captain's eyes, and expectantly fingered a pencil in the other. In the background lurked a very small signal boy, who had flown breathlessly down from the bridge with the signal; but not, to take it straight to the captain. Signal boys do not show signals to captains; this duty is reserved for yeomen and chief yeomen.

There is an exact scale of precedence in such matters at sea. Even important men such as yeomen do not show signals to admirals. In the latter case, a signal boy might conceivably actually carry the signal aft from the bridge, because signal boys with the eye of a yeoman upon them move at a speed only second to that of light. But should a signal boy on such an errand encounter a leading signalman, yeoman, or chief yeoman, he would at once deliver up the signal. The penalties entailed and the wrath incurred by his "short-circuiting" any of those above him in the hierarchy of signals, are almost beyond the power of description. Imagine then, the signal in the hands of the yeoman, does he take it to the admiral? Almost certainly not. He presents it to the Flag lieutenant, who will then decide whether the admiral shall see it at once or whether it will wait.

I feel very tempted to launch out into a little discussion about flag lieutenants, as I know a good deal about those interesting and remarkable people, for I have been intimately associated with one of them. I remember he had fifteen suits of plain clothes, a pretty taste in things sartorial, and we were of a size; but I must resist the temptation and get back to my subject. This was what the captain read:

From Captain to Captain H.M.S. B—— to H.M.S. R——.
We should like to serenade you this evening.—1400.

The captain's eyes twinkled, and a smile played about his lips. The Chief Yeoman licked the end of his pencil and held it poised over the pad.

"Make, W.M.P.," said the captain.

Down came the pencil like a dagger and W.M.P. appeared across the signal pad. The Chief Yeoman saluted, and retired in dignified haste; having rounded a corner, he gave the pad to the awaiting signal boy, and tersely remarked "Nip." But the youth was already half-way to the bridge, and a quarter of an hour later, the captain of H.M.S. B——, at the other end of the harbour, had a signal shown him by his Chief Yeoman to the effect that his brother captain's reply was "With much pleasure."

The announcement that the B——'s wanted to serenade us, caused a sensation in the Ward Room. Every one agreed on one point, and when the Commander remarked: "Got plenty of beer on board, Pay?" it was with consternation that we heard the Paymaster reply: "Opened up the last dozen to-day!" It was recognised that a crisis had been reached. The Mess Committee met at once, and decided to send the Wine Steward round the squadron in the skiff on a tour of enquiry.

I had the middle watch and therefore did not feel inclined to be serenaded. Furthermore "serenading" is always associated in my mind with the opposite sex, and I felt that I should feel like the French officer to whom I was once attached as A.D.C. when a part of their fleet paid a courtesy visit to one of our south coast resorts. My friend and I attended an entertainment announced as a "gala operatic performance in honour of the French Fleet." As I ushered our gallant guest into a draughty theatre which was filled exclusively with sailors from both fleets, the Frenchmen surveyed the scene, then, turning to me with an expressive shrug, pathetically remarked: "But vere are de vimmen, I mean ze ladies?" But again I digress!

* * * * *

It was a perfect evening of the north in early autumn, not a breath of wind ruffled the oily calm of the waters of a certain base which sheltered units of His Majesty's fleet. The long lines of ships stretched literally for miles across the water. Though the ships were darkened, their great forms were plainly visible in the light of a full moon which was rising blood red in the east, as the last high lights of sunset lingered above the western hills.

Three hundred men from neighbouring ships had been invited to come on board H.M.S. R——, and be serenaded at 9 p.m. At that hour the port side of our boat deck was packed with seamen. There must have been 600 men lining the side, clustered like bees half-way up the foremost rigging, on top of guns, on the bridges, in the searchlight platforms, anywhere in fact where the individual judged he would obtain a better view than his messmates. At 9 p.m. the sound of distant

bagpipes up the harbour, attracted everyone's attention. At first nothing could be seen, but suddenly an extraordinary sight met our eyes. Rapidly sweeping down on the top of the flood tide was a craft which reminded one of Henley at its gayest. We rubbed our eyes, but the indisputable fact remained that an illuminated houseboat was apparently proceeding up harbour. From this craft came the skirl of the pipes, the beating of many drums great and small, and the frenzied cries of (presumably) Scottish bluejackets.

Swiftly she came down the lines, causing great sensation on board the other ships, who were unaware of the proposed *tamasha*. Several ships burst into spontaneous cheering and then wondered why they had done it, and what all the fuss was about. In several ward-rooms ingenious individuals deduced that some good war news had come through, and that the Flagship had devised a new method of announcing it to the fleet. A friend of mine in the H——, actually complained to me next day that he was so overcome at the sight of an illuminated boat, that in a fit of mad optimism he had registered a wager of one Bradbury to ten that Turkey was suing for peace.

When the serenaders arrived off our beam, the bagpipes stopped and a choir of male voices enquired if we were the R——. A hundred voices answered in the affirmative, and our visitors altered course and came to rest at a distance of about forty to fifty yards from our beam.

We could now see that the theatre consisted of two distinct parts. There was a sailing barge, which had been decked in with planks placed across the thwarts. In the centre of this was a small stage lit by half-a-dozen footlights. Round the stage and grouped at the back, were stools and chairs on which were seated about 40 men in every kind of fancy dress. Amongst those we noticed, as they say in society papers, were Charlie Chaplin, and certain of the Hohenzollern family. At one end of the barge was a piano and a couple of violinists. A mast at the bow and another at the stern carried a row of Japanese lanterns on a jackstay between them. A picquet boat lashed on the far side fulfilled the double rôle of a dressing room and the source of the motive power required to stem the tide. The rays of a shaded arc lamp were thrown on to the stage from our bridge, and a gentleman stepped into the limelight and remarked, "I vos de manager, shentlemen."

When the tumultuous applause which greeted this observation had subsided, he proceeded to inform us lest any member of the audience felt alarmed by the idea that prowling Zepps would be attracted to the scene by the brilliancy of the illumination, he had much pleasure in announcing that the plug in the bottom of the boat was a very loose fit, and that it would be immediately withdrawn as soon as the alarm was sounded. In one and a half minutes he assured us the stage would be completely submerged. He added that all the performers, save only the two Willies, were fitted by the management with Mr. Gieves' famous waistcoat.

At 9.15 the serenade began and lasted an hour, during which period an excellent performance was given. Each turn was allowed five minutes. At its conclusion, during the applause, Charlie Chaplin stepped on to the back of the stage and in the manner familiar to any patron of the cinema, neatly yanked the performer off the stage with the crook of his stick. There were several songs by a well-trained quartette, and the effect of the voices stealing across the water and faintly echoing against the armour on our side, was delightful.

At 10.20, they sang "Farewell comrades," with a choir of about 60 voices. It was followed by "The King," which was sung by 600 men. We implored them through megaphones to come on board and refresh themselves, but the manager excused himself, by breaking into poetry to the effect that

The way is long
The tide is strong, etc.

Slowly they steamed round the ship, whilst the delighted audience gave them round after round of cheers. As they passed close under our stern for the second time, we heard the sharp tinkle of the picquet boat's bell signalling "Full speed ahead." Instantly the serenaders shot ahead, the drone of the bagpipes rose to a screech, and the drums crashed and rolled. In a few minutes nothing could be seen save the white wake of the serenading party as they skirled their way up harbour, homeward bound to their ship.

Dead silence reigned on board as the strains of the bagpipes receded faintly into the night. At length our Commander spoke, and there rose the plaintive wail of the boatswains' pipes, "piping down the hands." There followed the measured tramp of many feet, till at 10.45 the upper deck was deserted save for those on watch, and the slow pacing figures of the Night Guard:

Life and Letters

By J. C. Squire

Dr. George Saintsbury

DR. GEORGE SAINTSBURY'S retirement, at something over seventy, from his Edinburgh Professorship, did not connote a farewell from authorship although he had written enough books and parts of books to sink a ship. He plunged at once into one more large scheme, a *History of the French Novel*, of which the first volume has just been published (18s. net) by Macmillans. He suggests that this "must in all probability be the last of some already, perhaps, too numerous studies of literary history," but I would lay odds that he is wrong, and am happy in the conviction. Dr. Saintsbury, although he has been a Professor of Literature, and although he has all sorts of cranks and limitations (including a deplorable inability to see the beauty of some of the finest modern literature), has never been a pedant or a dullard. This, in a Professor, is much. For literary history, like history of other kinds, suffers from the operation of the general rule that people who could do the main job won't do the donkey work, and that people who like the donkey work are quite unequal to the job. One of many bad results of this is that there is a terrible lot of copying of opinions. Something, labelled in a certain way, goes into a history, and gets transferred into all the other histories until some innovator comes along and makes a fresh start.

* * * * *

Dr. Saintsbury, at least, is no respecter of persons or their views. He has read almost everything that ever was written, and it is safe to say that his opinions about it all are invariably his own. He even, perhaps, shows signs of a tendency to regard other people's judgments as challenges; he is quite obviously happy when he is disagreeing—which he never does without a show of reason—with another critic or an accepted view. This may mean that he often goes astray; but it has also meant that, in his studies both of French and of English literature, he has frequently called attention to the merits of neglected works and to the defects of belauded ones. The *History of the French Novel* is not a book to be attempted by anyone who knows nothing of the French novel; but it could not fail to interest, stimulate, and provoke to thought any reader who has a general acquaintance with it.

* * * * *

The volume covers the subject from the beginning up to 1800, the only really richly productive century being left for later treatment; and the term "novel" is made to include anything which is written in prose, and which tells a story, wholly or mainly fictitious. No other system of classification would have been so easily defensible. Dr. Saintsbury brings in the Mediaeval Romances and fabliaux (he admits verse thus early), the works of Francis Rabelais, all sorts of short stories and collections of such, the fairy stories of Perrault, Madame d'Aulnoy, and others, as well as books which would be considered novels by the casual modern observer. The ground is well covered, all the really important figures are adequately treated, and when Dr. Saintsbury completely omits men whom the orthodox critic would automatically include—such as the authors of *Les Liaisons Dangereuses* and *Les Amours du Chevalier de Faublas*—he is able to justify his action.

* * * * *

His conclusion on the French Novel to 1800 is that France grew the seed of Romance for all countries; and that "from 1400 to 1800 she entered upon a curious kind of wilderness, studded with oases of a more curious character still." Continually the French invented things which were more fully developed elsewhere; but they achieved few masterpieces, and they had no period which for production could compare with our own eighteenth century with its Defoe, Swift, Richardson, Fielding, Smollett, Sterne, Goldsmith and Jane Austen. Dr. Saintsbury is enthusiastic enough when he comes to anything indisputably good—*Gil Blas*, that remarkable accident *Manon Lescaut*, or the first part of Rousseau's *Julie*, which he criticises with great discrimination. He has a favourable word for *Télémaque*, now less read perhaps than any work once so universally known; he discovers and praises the merits of *Crébillon fils*, whose qualities, as a stylist, narrator and wit, have been in this country smothered under the evil reputation of *Le Sopha*; he gives precisely their due and no more to the early collections of *contes*, and he is almost lyrical about Hamilton's tales. But the mere reputation is nothing to him. Cyrano de Bergerac—whose *Voyage* has small meritorious patches which would bear quotation—he dismisses with almost too great a

contempt, in spite of his factitious fame; he is cold about Marivaux; and to Voltaire he is openly hostile. Of Voltaire (who "did a great deal of harm in the world, and perhaps no solid good") he says that he was "perhaps the greatest talent—but—not—genius ever known." There is some sense in this in my opinion, but it is evidently a matter of opinion, as is also the decision that if a monkey could write he would write like Voltaire. At all events, Dr. Saintsbury appreciates *Candide* as what it is: a skit which, however superficial, is as permanently entertaining as anything ever written—an almost perfect work of art. Possibilities of greatness as a novelist are detected in Scarron. Dr. Saintsbury's conclusion is that Rabelais was the greatest novelist of those dealt with here, and that Diderot might have been a second, possibly as great. These judgments, from which I for one should not dissent, are an instance of Dr. Saintsbury's habit of thinking for himself. On both authors he is at his best, and the chapter on Rabelais may be commended to all who misunderstand that gigantic story-teller. As for his meanings, and the struggles of modern allegory-hunters, Dr. Saintsbury is very sensible. It is generally supposed, he says, that

there must be a general theme, because the writer is so obviously able to handle any theme he chooses. It may be wiser—it certainly seems so to the present writer—to disbelieve in anything but occasional sallies—episodes, as it were, or even digressions—of political, religious, moral, social and other satire.

Panurge he describes as "the first distinct and striking character in prose fiction." As for Diderot (who, to my taste has like Rabelais something very English about him) Dr. Saintsbury's judgment is not supported by that dull and mechanically nasty fantasia which he wrote for money and which is so uncharacteristic of him. And it is not founded upon *Le Neveu de Rameau*, a work the subtlety and modernity of which has made it latterly the object of a cult. It is based entirely upon *La Religieuse*, and quite soundly. What Diderot knew about life in convents is more than I can say; but that novel is astonishingly true to life in general. It is the work of a real novelist, whose men and women come alive to him and act of their own volition; its unlaboured vividness, its natural vigour, the spontaneous force of its dialogue, are unmatched in French eighteenth century literature. And there is suffering behind it.

* * * * *

Dr. Saintsbury's is as readable a book as could be written on the subject. Biographical information is given only where it is likely to be needed; the extracts are well and unconventionally chosen; and Dr. Saintsbury does not proportion his book as a hide-bound scholar would have done. That is to say, mere names are nothing to him. If he thinks he can get a celebrated person successfully disposed of in a page or two, he does so, and if he thinks a book so well known that analysis of its contents is unnecessary, he passes on, leaving himself more space for the full treatment of books about which he has something special to say or which, though historically important, are scarcely ever read. Two examples of the latter class are D'Urfé's *Astrée* and Mme. de Scudéry's *Le Grand Cyrus*, the prototypes of seventeenth century pastoral and historical romance. No history would omit them, but few historians would read them or, at any rate, do more than skim through them. Dr. Saintsbury is exhaustive on both; he has done his duty like a man; the book which would daunt him by its size has not yet been written, and that chronicle of which Macaulay said that it might have been read in the age of Hilpa and Shalum would have been child's play to him. He seems, as a result of his researches, to have found *Astrée* as charming as it used to be thought; but his exploration of *Le Grand Cyrus* still leaves one completely in the dark as to why our ancestors were so devoted to it. His account, however, temporarily invests the work with an interest which (save archaeologically) it does not possess; and the same thing may be said of his remarks about even the dullest and most "minor" items in his catalogue. He is well over seventy, but his zest for life, literature and controversy is unimpaired. He eats his way through the centuries like a hungry caterpillar. No serene and reminiscent old age for him: he is as eager as ever to form and formulate new judgments, to maintain old ones against new opponents, to infect the reader with his enjoyments and his detestations, and to hit the twentieth century—which he seems to regard as the peculiar home of radicalism, paradox, morbidity and pretentiousness—on the nose. But even one who does not share all his views can stand his thumps for the sake of the enlivening spectacle he presents when delivering them.

France, One and Diverse

By F. T. Eccles

A LITTLE more than two years ago, I recommended in these columns the first volume of a series in which the most accomplished of living French authors had undertaken to interpret the spirit of his country at this great crisis of its history. It was called (after a formula which had all its freshness then) *L'Union Sacrée*, and consisted of articles contributed at the rate of two or three a week to a Paris newspaper. In this long interval, Maurice Barrès has published six other volumes, of which the least that can be said is that, while their permanent value is as certain as that of any writings which the war has inspired upon our side, they have the immediate virtue of a cordial. With an unflinching justness of accent, he has praised the fraternity of the trenches and the devotion of French women, recorded his impressions of the countryside recovered from the grip of the invader, and pleaded the cause of disabled soldiers. But the latest instalment of this moral chronicle is concerned with a matter more delicate and indeed more vital.*

Its exceptional interest will I think appear from a bare statement of its leading thought. In the years of peace, opposite conceptions of life were the cause or the pretext of the most dangerous hostility between French citizens. Far from losing their power, they have been fortified by the war, for its most obvious conditions have thrown back the individual combatant upon his moral reserves; but every belief, every ideal, that is capable of raising the mind to a height from which it contemplates danger, suffering and death without dismay, has confirmed or sanctified the same willing sacrifice in the same national cause. The soul of the conflict (thinks Barrès) is in the letters and diaries of soldiers. Many of course are colourless, empty of thought; but the confidences of the finest natures among those who have died for their country, reveal the various spiritual sources of an equal heroism, and anticipate that harmony of differences which is the promise of to-morrow.

The "Spiritual Families" to which Maurice Barrès has confined his record are five—the Catholics, the Huguenots, the Jews, the Socialists, the Traditionalists; the list is evidently incomplete. His very title pledged him not only to do equal justice to the large minorities whose existence has long since broken the spiritual unity of the older France, but almost to forget that they are minorities still. No one will grudge the space he has assigned them. The immensely greater number of his readers needed no telling how a Catholic soldier is sustained by his faith. It is mainly of the priests in the French army, of their admirable example and incalculable influence, that he tells in the chapter devoted to the Catholics. They number some five and twenty thousand, and most of them are in the ranks. Fifty-six fell in battle during a single month; two hundred and six were killed before Verdun last year.

There is abundant testimony to the devotion of the Huguenot soldiers. The extracts from the letters of Pierre de Maupeou, of Francis Monod, of Maurice Diaterlin, and especially the opening words of a sermon preached at Nîmes by an aged minister after the death of his son, are very precious documents. It would seem that the French Protestant is pre-occupied, in a peculiar degree, with the *justice* of the national cause. Of the Jewish soldiers of France Barrès writes, naturally, with some hesitation. The Jew does not always belong to the Jewish spiritual family in any sense which would imply a definite system of dogmatic belief: he always belongs to a separate race. It is impossible to read what Barrès tells here of Amédée Rothstein without sympathy. This was a young Zionist of foreign birth, who enlisted enthusiastically in the French army, won a commission and was killed last year. He was a Jewish patriot above all else, and his hope was that his service to France might somehow help the cause of Israel. Hardly less touching is the case of Robert Hertz, a Jew of German origin, who wrote to his wife:

I consider this war as a welcome opportunity to "regularise the situation" for us and for our children. Later on, they may work if they like for super-nationalism or internationalism; but first, it was essential to show by our acts that we were not below the national ideal.

Barrès remarks very justly that for these new-comers, "who cannot feel the irrational and almost animal side of our love for our country," patriotism is an act of the will, a matter of intelligent choice, of voluntary partnership. But there are Jews who descend from generations of French citizens. The appendix includes an illuminating letter from

a Jewish Alsatian. A characteristic (though a rare) figure was Roger Cahn, a Normalien and a free-thinker, detached from the religious tradition of his race, whose letters from Argonne (where he was killed) express a curious indifference, impossible to a Frenchman of French stock, to the great drama in which he played his modest but entirely honourable part. Happy in his insulation, he was intent only upon enriching his consciousness with poetical sensations. "I shall bring back," he wrote, "a splendid collection of pictures and impressions."

The chapter on the French Socialists is introduced by a short account of the vicissitudes through which the official party has passed during the war. But the Socialists at the front are another affair. As was only to be expected, the author of *L'Ennemi des Lois* can enter into the scruples of sincere idealists and that candid faith which identifies the victory of this country with the renovation of the world. He insists upon the French artisan's respect for good work (which goes far to explain why so many "conscious proletarians" make excellent soldiers) and for a freely accepted discipline. An officer, himself a Socialist by conviction, who had in perfection "the delicate art of commanding in the French way," put the matter very clearly when he said: "The Socialist in the army does not put his confidence in gold lace. He waits to see his superiors show what they are made of." One of the most attractive figures in this book is that of a Syndicalist schoolmaster killed in the war. Albert Thierry left behind him a kind of testament, which resumes his vision of a juster and more united France. He was the son of a Paris stonemason, and the strongest of his convictions was an abhorrence (his master Proudhon felt it long ago) for that want of stability which the worship of success in life encourages. The duty of sticking to one's class was one he was never tired of impressing upon the children of working-men who were his pupils. Here is a notable passage quoted by Barrès:

The Frenchman, worthy of the name, proud of his history, of his thought, or of his faith, desires to be just or not to live. He comes into the world as best he can, born in a country not easily defended nor easily pacified, burdened with the inequality of mind and body which belongs to nature, and the economic and historical inequalities that belong to society. He receives, whatever his birth, an education grounded above all on labour, science and history; and by it, his mind and heart open to the conceptions of equality, justice and truth. A moral system clearly based upon the new principle of the "refusal to rise in the world," makes of each of these Frenchmen a citizen who disdains mere enjoyment, desires to do service, is in love with his work, free from self-seeking, worthy to be loved.

Reverence for the past, no less than Utopian dreams, may supply an incentive to heroic sacrifice. But do the Traditionalists—and under that denomination Barrès includes Catholics and followers of Comte, *Camelots du Roi* along with Nationalists of his own type and temper—form a true spiritual family? It is, at any rate, certain that among young French soldiers of the intellectual classes the emulation of the dead, a love of the soil enlarged and purified by the historical imagination, a conscious fidelity to the genius of the race are active and vivacious forces distinguishable from the positive creeds which they accompany.

A very beautiful and moving chapter (which must not be mutilated by quotation) describes that fair Christmas Eve on the French front which has passed already into legend—"a night of hope and reconciliation," when all the divergent motives for self-sacrifice and endurance took contact and "France recognised the unity of her heart." Will the promise of that comrades' feast be kept? "No doubt we shall not remain on those heights." But this book ends on a note of confidence:

This time of stress will remain as a kind of ideal for those who lived through it in their youth. . . . They will always remember what the Holy Concord really meant during the war. . . . It did not consist in recanting our beliefs or hiding them away in a cupboard like something useless which we could attend to later. It implied no forgetfulness of that which vivifies our consciences, but on the contrary was born of those beliefs, which meet far below the surface in their more excellent parts. Each of our Spiritual Families has maintained its rights, but in their purest form, and has thus found itself nearer to others which it had supposed more hostile.

We Frenchmen are united, because from the scholar down to the humblest peasant, we have a clear vision of something superior to our little personal concerns and a kind of instinct which prompts us to sacrifice ourselves cheerfully to the triumph of that ideal. A Crusader thinks it nothing to redeem the Tomb of the Saviour at the price of his own life; old Corneille enraptures all his public with his declama-

* (*L'Âme française et la Guerre*)—vii. Les diverses Familles Spirituelles de la France.—Paris, Emile-Paul frères, 1917, 3f 50.

tions upon Honour: Vincent de Paul is sure of finding followers in his charitable mission. . . . All the gestures of our past, all the noble testimonies of to-day collected here, are only the product of a single, simplified conception of France—the champion of right in the world. Each of us knows that the French are there in order that there may be less unhappiness among men. In this sense France is "pacifist"; in this sense she is warlike. The notion that this war must be the last is an old popular notion. "We must suffer; our children will be happier!"

Thus does Maurice Barrès find his hope of an enduring concord on the persuasive evidence of a fruitful diversity.

Books of the Week

Letters to Helen. The impressions of an Artist on the Western Front. Illustrated. By Keith Henderson. (Chatto and Windus, 6s. net).

The Path to Rome. By Hilaire Belloc. Fourth Edition. (George Allen and Unwin, 3s. 6d.).

The Long Trick. By "Bartimeus," author of *A Tall Ship*. (Cassell, 6s.).

Our Girls in Wartime. Rhymes, by Hampden Gordon. Pictures by Joyce Dennys. (John Lane, The Bodley Head, 3s. 6d. net).

KEITH HENDERSON occupies an honourable position among the little company of artist fighting-men, who have done so much to bring home to sheltered folk the actual conditions under which the war is being fought in France and Flanders. His paintings convey not merely the abomination of desolation wrought by modern man's mechanical weapons of destruction, but the triumph of Nature which seems ever to be working for beauty and peace against the apparently senseless human mania for the reverse. In this intimate volume we see as it were the mind of the artist at work; his intense love not only for the pleasure of the eye but for all mortal things, animals as well as human beings, which are moved by sympathy. His *Letters to Helen* are a reflection of a charming temperament; they demonstrate beyond question how warfare humanises the soul of man, and only dehumanises where the soul or living spirit is absent. It is a book which we can well imagine men at the Front will delight to send to womenkind at home whom they love—an intimate book, which expresses thoughts and ideas we believe to be common to the best type of Briton.

* * * * *

That glorious ebullition of a healthy, hearty, full-blooded man in complete harmony with God, the world and himself, which goes by the name of *The Path to Rome*, and whose author is one Hilaire Belloc, has just been issued in a new edition. It is too late in the day to make any comment on this verbal cataract of wit, wisdom, and pure joy of life, but those who in times past have delighted in it—their name is Legion—and who would like to pass on the pleasure to others have now a new opportunity.

* * * * *

In the course of his first long novel, *The Long Trick*, "Bartimeus" confesses that it is "an endeavour to trace the threads of certain lives a little way through a loosely woven fabric of great events." that is to say, it is hardly a novel in the ordinary sense of the word. The Indiarubber Man is there, and his friends are there, but on the whole they are mere accessories to a picture of the Grand Fleet in harbour and in action, and the book will be read—and remembered—because it is the most vivid picture of the Fleet and its activities that has yet been made. Out of these pages one may gain acquaintance with the sailor man of all ranks, at work and play—and fighting too, for there is given a sailor's view of the battle of Jutland, a view which will go far to correct the nonsense that has been talked regarding that battle. "Bartimeus" is a master of the right kind of realism; one understands, in reading, that the writer has not to depend on imagination for any of his chapters, but that he saw what he describes, and describes all in such manner that the reader can see it too. The result is not a conventional story, but a view of the Navy as a whole, with certain recognisable figures who, though in the foreground of the view, exemplify rather than obscure this admirable picture of the life of the Grand Fleet, and the complementary lives of the women who wait on shore.

* * * * *

Our Hospital A.B.C. was a flippant book of verse and sketch which caused no little amusement in hospitals, V.A.D. and others, last winter. The same authors—Hampden Gordon and Joyce Dennys—have just brought out a companion volume entitled *Our Girls in Wartime*. It is good fooling, and shows beneath it a genuine admiration of what "our girls" are doing. There is plenty of laughter here, for it is chaff, good, honest, wholesome chaff, right through.

THE CHURCH ARMY

has many hundreds of

RECREATION HUTS, TENTS AND CENTRES

At Home and Abroad, for the Spiritual, Moral and Physical Welfare of our gallant Soldiers and Sailors, including 200 UNDER SHELL FIRE.

MORE ARE URGENTLY WANTED

Also good provision of COMFORTS for the Approaching Winter.

Huts cost £500

Tents £300 Fully Equipped

Cheques crossed "Barclay's, a/c Church Army," payable to Prebendary Carlile, D.D., Hon. Chief Sec., Headquarters, Bryanston Street, Marble Arch, London, W.1.

Behind the Firing Line

The most remarkable and vivid impression of the battle area in France and Flanders is to be obtained from the series of engravings in colour by Captain Handley Read, just published by the Leicester Galleries.

A limited number of copies of this Portfolio may be obtained, price £5 5s. each, from "Land & Water," 5 Chancery Lane, London, W.C.2.

THE NATION'S FUND FOR NURSES.

One of the most deserving objects of support at the present time is the Nation's Fund for Nurses, which aims at assuring aid for such nurses as have lost their health during the war. In addition to providing a benevolent fund for individual nurses, this scheme is intended to provide endowment for the College of Nursing, which has been founded to provide a central organisation representative of the nursing profession, elected by nurses and intended to win recognition for the nursing profession. The Fund has the support, among others, of Sir Arthur Stanley, chairman of the British Red Cross Society, and of Sir Douglas Haig, both of whom are keenly interested in the scheme. Contributions to the Fund will be welcomed, no matter how small they may be, by the Honorary Treasurer, the Viscountess Cowdray, at 16, Carlton House Terrace, S.W. 1, or at 21, Old Bond Street, W. 1.

Mesopotamia New and Old

The New Hindia Dam

Ruins of Babylon

Mr. Lewis R. Freeman, in "Bagdad at any Cost," described last week Sir William Willcocks' great barrage or dam of the Euphrates at Hindia. The upper picture is a photograph of the Hindia Dam, the lower of the ruins of Babylon. The similarity in the massive masonry work of the two civilisations is remarkable

Donations should be sent to the Hon. Treasurer, "Working Men's Belgian Fund," 32 Grosvenor Place, London, S.W.1 (Registered War Charities Act, 1916), earmarked for the "Belgian Children's Fund."

**FOR INDIGESTION
A FAMOUS PHYSICIAN'S REMEDY**

As a remedy for Indigestion and Acidity Messrs. Savory & Moore strongly recommend Dr. Jenner's Absorbent Lozenges, which they make from Dr. Jenner's original formula. The Lozenges are pleasant to take, quite harmless, and give speedy and permanent relief even in the most stubborn cases.

TESTIMONY:

"With great pleasure I add my testimony to that of others who have taken Dr. Jenner's Absorbent Lozenges and derived great benefit from their use. My powers of digestion seem really strengthened, and the distressing FLATULENCE from which I suffered is greatly relieved."

"Miss B.—tried the Absorbent Lozenges and found they gave relief in an attack of ACIDITY OF THE STOMACH when the usual indigestion treatment had failed. Further supplies obtained locally led gradually to a complete cure."

"I found Dr. Jenner's Absorbent Lozenges wonderfully beneficial in preventing a SINKING PAINT FEELING which I think is described as HUNGER PAIN. I have suffered much from this, but since taking the lozenges have felt quite a different person."

"I suffered very much from HEARTBURN and ACIDITY, and your remedy has been wonderful in relieving this, and consequently curing the almost incessant SLEEPLESSNESS I suffered from."

Boxes 1/3, 3/-, and 5/-, of all Chemists.

A FREE SAMPLE

of the lozenges will be sent on application. Mention LAND AND WATER, and address, Savory & Moore, Ltd., Chemists to The King, 143a New Bond Street, London, W.1

**DR. JENNER'S
ABSORBENT LOZENGES**

Names and addresses of shops, where the articles mentioned can be obtained, will be forwarded on receipt of a postcard addressed to *Passe-Partout*, LAND & WATER, 5, Chancery Lane, W.C. 2. Any other information will be given on request.

**Coats for
Chilly Weather**

Just at the moment a clever shop is laying special stress on their sports coats for the cold weather, and doing so with ample reason. For anything so nice as these particular coats has rarely been seen. Made of Scotch wool, they have a delightful warm fleecy surface, the fleece being sometimes inside sometimes out, but always adding to the warmth-giving properties of the coat a hundredfold. Coats of this kind have gone up so immensely in price that it is good to hear the shop in question are selling them at 59s. 6d. At this they come very near to the bargain category, if, indeed, they are not in it altogether. The available colourings are lovely, a particularly becoming shade of oatmeal being amongst them.

For people really feeling cold weather, a coat such as this is a possession *par excellence*. It gives warmth in a way few other garments do, and is becoming into the bargain, a point not always assured with all utilitarian garments.

Specially designed for the chilly mortal, too—though others will undoubtedly take them to their hearts also—are some jumpers in velour cloth, some with check collars, and pretty conceits of that kind, others more or less plain. They slip over the head, and are without doubt the most fascinating notions seen for many a long day, and a refreshingly opportune suggestion for winter. Blouses and jumpers of thick materials, unless well interpreted, are apt to be dowdy affairs. These, however, are just the opposite.

**The Best Way
of Cooking**

Now that coal has grown such an uncertain quantity everybody's attention, perforce, is turned to other means of cooking. Gas is one of the available and best mediums, and anybody with a gas cooker should certainly not only make the acquaintance of the new economy grilling dish, but have it for their own.

This is the cleanest, most efficacious and easiest way of cooking ever mooted. It is of English fireproof earthenware, and a nice looking dish it is, as fireproof dishes nearly always are. The results, however, are as good as its looks. This dish takes the place of the ordinary tin griller—always part of the equipment of a gas stove. It is put underneath the grid in just the same way, and once the contents are done can be brought absolutely straight from the stove to table.

This is the method of casserole cooking the French always advocate, and with abundant reason as their delicious dishes show. With this dish washing-up is saved, cooking pot and dish for the table being in one, and it is economical into the bargain, nothing being wasted, as it so often is in the process of moving the food from one dish to another.

The price is all in its favour, being the moderate one of 2s. 9d., an extra shilling being needed with country orders on account of the extra packing and postage.

**The Latest Frock
Overalls**

This winter will see women busier than ever at all kinds of war activities, the cold weather months always enabling an added outburst of energy in this way. For women workers of varied descriptions—canteen workers, munition workers, and for those doing equally useful things in the household or an office, some frock overalls have specially been designed. And capital in truth they are, the precise type of thing nearly every woman now finds indispensable.

These frock overalls are really like a coat frock, so completely do they cover up their wearer. Clad in one of them, a woman can do anything without the least concern over her clothes. It is really a practical working kit, built upon attractive lines, but with its main watchword utility.

They are made in soft finished zephyr cloth—a delightful fabric for the purpose. A feature of importance with these particular frock overalls is their most generous width. They are three yards round the hem, and any look of skimpiness is removed from the rest of the overall by the adroit arrangement of box-pleats. There are two each side of the front and three at the back. These are not stitched down in rigid lines, but go free, giving with every movement of the wearer and being doubly successful in consequence.

Two big pockets and a loose belt complete the matter, the overall being made in such a way that it can either button

The Best Boots for Active Service are Faulkners' Norwegian Boots

in their Special Service Leather fitted, for the winter, with their Patent Graemar Wader Attachment

The Easiest, most Waterproof, Wear-resisting Boots made.

All the models shown can be made with ordinary instead of Norwegian fronts if desired.

Write for Illustrated Booklets of Boots, Leggings and Spurs. Also self-measurement apparatus (regd.) if unable to call.

We accept full responsibility as to fit if the directions are carefully followed.

Faulkner & Son
SPECIALISTS IN SERVICE BOOTS & LEGGINGS.

51 & 52 South Molton Street, Bond Street, London, W.1
And 26 Trinity Street, Cambridge.

THE "WESTFIELD" SOFT SERVICE CAP with or without back curtain.

Fitted with waterproof lining and greaseproof shields,
16/6

The accepted design for both home and active service wear grips the head without pressure, and will neither blow nor fall off.

WEST & SON MILITARY TAILORS, BREECHES MAKERS,
152 NEW BOND STREET, LONDON, W.

THE CRISIS OF THE WAR

THE Alliance of civilised Europe is passing through a critical moment. Its gravity is recognised everywhere, though it is recognised in different degrees. The enemy has broken a portion of the Italian front. He has defeated one army of our Allies. He has turned their original line, and has compelled a general retreat. He has for the first time in over three years restored for some days a war of movement upon the West. He has captured in a successful struggle of only three days a hundred thousand prisoners and 700 guns. Consequent upon this blow he aims at achieving in the case of Italy something of the political result he achieved in the case of Russia. To the extent in which he can achieve his full political ends in Italy, to that extent he calculates that his forces can later be concentrated against the British and the French armies, and that he may thus become numerically the superior of those forces. Such is the situation.

The issue is very close indeed, because for the first time we are realising to the full what is meant by the inaction of Russia. We are faced by a strength which may now generally prove our equal, and it is working upon interior lines and upon chosen fronts. The immediate future shows no relief from that situation. It is time, if ever it was, to confirm within ourselves the fixed resolve that no trial the West may have to suffer will ever compel it to give way to the enemies of civilisation. Those words are not rhetoric to-day. They are a real and solemn appeal. There is no room left for discussion or for the miserable irritant which insignificant sheltered men with mad theories of an unreal bookish world plagued us with all last summer. Every energy must be concentrated for the moment upon the offensive-defence.

Only a week ago, before this blow fell, we were, in this country, recalling the famous actions which will mark throughout history the close of the month of October in the year 1914. Those actions, we remembered, decided the last form of siege warfare in the West. They closed the gate to the ports of the Channel. They saved the Straits of Dover. They completed that pinning of the enemy to earth which had been begun by the Battle of the Marne. The victory was achieved principally by the old and small regular army from this country, and the peculiar glory of the battle consisted in this: That the old regular army here met (on the same ridge which is now the prize of the contest in Flanders) forces overwhelmingly superior to its own and forces which despised the traditional armour of the English. The attempt of those forces to break the British line failed against the national character and the restricted but highly tempered weapon which was its product and its symbol.

To-day, under very different circumstances, we have yet the same moral forces upon which to rely and, if we are wise,

we can see the great issue far more clearly than we could see it in those critical hours of which the afternoon of Saturday, October 31st, 1914, was the climax. There is a sense in which this clearer vision makes our present task harder. We know far better now than we did then that it is truly life or death for England. We see far more clearly now than we did then that success or failure in arms is never a foregone conclusion, but lies upon the knees of the gods. It is a harder task than it was then, because long months of war, mourning throughout the country, the mere fatigue of such a strain, the increasing disabilities of living, reduce the elasticity of the national soul. And it is again a harder task in this: that the distance of the events now in progress, the geographical separation from our Flanders front of the Italian field where a decision hangs in the balance, warps our judgment. It is difficult for us to realise the full significance of what is passing on the level, baked arena of that vast and splendid amphitheatre, the tiers of which are the encircling of the Julian Alps. It is there, in the same flat, autumn land, which saw Alaric first passing and suffered the ravage of Attila, that civilisation is again at stake—as it was at stake three years ago on Attila's other battlefield of ultimate defeat at Chalons and the Marne. May the omen serve.

Next after the full reinforcing of the national will for the trials that lie before us, it should be our chief concern to estimate fully, without self-illusion, without panic, above all without the detestable habit of self-praise, the weight of what is happening those hundreds of miles away in Friuli and the mountain-guarded Venetian Plain. Every Englishman must seize for himself and clearly appreciate the nature of what has already passed. The success of the enemy is far greater—in mere numerical computation, let alone in significance—than anything the war has yet seen in the same compass of space and time. He has won a much greater victory than Tannenberg. He has done far more than was done by him in his first effort against Verdun, or than the French and British have done in any one of their attacks of corresponding duration. He has done more than he did in any one action of the Polish campaign, and he has done it not in the empty wastes of Eastern Europe, but on the crowded and vital soil of Italy. He has suddenly, at a moment when the moral of his civilian and military population had fallen to a dangerous point, presented them with great news of victory. He has changed in a week the whole temper of his forces, and even his Higher Commands to-day envisage the war after a fashion wholly different from that in which they envisaged it a brief seven days ago.

These words are written three days before they will be in the hands of our readers. Those three days will be the critical days of the campaign. It may be that the enemy advance will find itself checked upon the Friulian Plain, and that after grievous loss in men and material, our Allies will re-establish their line further to the West. It may be, on the contrary, that the pursuit shall be so vigorously handled as to forbid this rally and to produce results far graver and more decisive than any we have seen. It may even be that a war of movement, having been thus restored in the Italian lowlands, the event will turn against the enemy, and that manœuvre will recover what siege tactics had lost. We cannot tell. The event will decide. But what we must none of us do is to flatter ourselves that actions of this magnitude, and proceeding at this speed, upon any part of the Western front, are without an immediate effect upon the whole of it. If the enemy achieves his object in Italy, the whole situation of the war is changed and turned against us. This should surely be clear to all. That it is not everywhere grasped with equal facility is due to the many impediments of distance, of diverse national character, of attention concentrated upon other fields—above all of a fear to face facts. Those impediments it is the immediate duty of all honest and patriotic publicity to remove. As necessary as it was some months ago to stem the stupid and dangerous forces of panic and irresolution when foolish men talk wildly of an advance on India and the rest of it, so necessary is it now to counteract confusion of thought and slowness of thought in the public appreciation of our grave peril. The more soberly and thoroughly we realise the peril, the better we shall be able to meet it.

The Italian Peril

By Hilaire Belloc

THREE military events have distinguished the past week. They differ greatly in importance and are, in order of their importance, the breaking of the Italian front in the Julian Alps, the French action beyond the Aisne Ridge, and the further slight advance in Flanders.

The first of these is clearly a thing of the very first magnitude. It must be dealt with more thoroughly and its significance comprehended even more clearly than the victory of the French in the Laonnais. It may determine the future of the war. It has already profoundly modified its character. Its gravity cannot be overestimated.

And all this is true, not because the second Italian army has suffered a complete defeat—that may be repaired—but because this defeat is the result of what we now at last see to be the true situation of the Russian armies and the true attitude of the enemy towards them.

To understand what has happened we must begin by appreciating the two fundamental conditions of this enormous struggle, I mean the two fundamental military conditions as apart from the economic conditions which also determine it.

These two fundamental military conditions are the superiority of the old Western civilisation over the Central Empires in intelligence and direction of effort, and the superiority of the Central Empires (or, at any rate, of their governing Powers) over the more primitive conditions of the East.

The former of these truths we have long appreciated from familiarity with Western conditions, from patriotism, and perhaps from vanity as well; but the latter has been but slowly grasped and is perhaps not fully grasped even now.

The former gave us the Marne, which saved the civilisation of Europe from immediate and apparently inevitable disaster. The Marne was won because the intelligence of an old civilisation, as it appeared in the particular field of strategy, was superior to that of the Germans. That superiority in Western civilisation not only gave us the Marne: it also gave us the miracle of the British military expansion: A thing which not only the enemy but probably most of our friends (and we ourselves, for that matter) might have thought impossible. It gave us the power, did this first principle of Western superiority in culture and intelligence, to meet every new violation of international morals on the enemy's part by rapidly improvised counter-methods. It permitted the Western forces, far inferior numerically in 1914, to pin to the earth a numerically superior enemy, and it developed with astonishing rapidity that power of munitionment of which Britain is the mainstay and which covers the whole of the Alliance.

That first principle did all of these things, and (legitimately) was in our eyes the governing condition of the war on its purely military side.

But the second truth has proved very powerful indeed in modifying to our disadvantage the consequences of the first, and is at work with disastrous effect to-day.

German Knowledge of Russia

The German system of the Central Empires understood and could defeat the less developed society to the east of them. We knew that it was immensely superior in industrial power. We expected that superiority to tell. But we found it superior in a degree we had not expected. We found its political discipline also superior to that of the Slav in a degree we had not expected. Above all, we discovered the German to have known the complex which used to be called the Russian Empire as we in the West could never know it.

It is this knowledge he has of the East, this superior knowledge, which has produced the critical position in Italy.

In the spring of 1915 every Western student of the war could tell you how the lines lay, the threat to Hungary through the Carpathian Passes, the strategical chances of the one side and of the other; the approach of the Russians to the Moravian Gate; the importance of the Dukla Pass; the disadvantage they suffered from lack of lateral railways in Russian Poland, etc.

Every Western student of the war could also have told you that the enemy's industrial power being superior to that of the Russians, his power of munitionment was also superior.

What such a student in the West could not have told you, what no Western statesman or publicist dreamt of, but what the authorities of the Central Empires clearly understood, was the degree of this difference in power of munitionment and the

consequent chance the Austro-Germans had of breaking the Russian front.

When the trial came the thesis of the German General Staff in this matter was amply confirmed. The difference in power of fire was overwhelming and the Russian lines in Galicia were pierced.

There followed a retreat conducted in a masterly fashion by the Grand Duke Nicholas, which preserved intact the organism of the Russian armies and the greater part of their artillery. But Poland was overrun and, north of Galicia, the lines in nearly their present state established by the enemy. During the whole of that advance in the summer of 1915 by the armies of the Central Powers, the governing condition was the overwhelming difference between munitionment upon the one side and upon the other: Not only difference of munitionment in shell and general supply, but in the elementary matter of rifles.

To-day the same phenomenon has appeared. Everyone watching the war from the West, with the very imperfect knowledge of Eastern conditions which the West possesses, postulated the necessity under which the Central Empires must be of keeping a certain minimum of men to hold the Eastern line. To hold that line at all with such a very small number (considering its immense length) was only made possible, of course, by the political collapse of Russia, or rather of the numerous differing racial and religious groups which had formerly been called "Russia" under one common term. The Germans had kept there, on the Eastern front, about one-third of their total forces, and many of these of inferior material; the Austrians less than half their total. The immense line was watched by less than one man to a yard, counting everything—all the local reserves, all the auxiliaries. Never in history had a continuous line been so thinly held.

Western Assumptions

It was postulated in the West that, though the forces of the Central Powers thus detailed on the Eastern front were virtually in repose, subject to no pressure and suffering from no appreciable casualties, yet the enemy could not afford to leave gaps and to jeopardise the continuous strength of that line because the Russian Revolution, though in the military sense a chaos, was yet also, in the military sense, incalculable. The enemy's Higher Command (it was thought) could not be certain that at any moment a reaction might not take place, discipline be restored in at any rate some portion of the idle men still wearing Russian uniform, and some local attack prove disastrous to the Austro-German defensive lines unless a bare minimum were left to defend them.

We now know that this calculation was erroneous. The enemy, both Austrian and German, to whom the former Russian Empire and its inhabitants were not a distant thing known through books, but an immediate domestic problem intimately studied, had gauged the Russian situation weeks ago, and had gauged it rightly.

Western civilisation has for its defence under arms, and has always so had, far less men than the great mass which works under Prussia. The counterbalancing weight, the thing which made the event certain, was the number which the old Russian Empire could in practice keep armed and use actively as soldiers. This number was of course smaller in proportion to the Czar's subjects by far than the corresponding mobilised force of the Western nations. But it sufficed to keep the balance even while the material resources of Great Britain were being developed after the astonishing fashion we have watched during the last three years, while the human material was being trained with a no less astonishing rapidity, and while the French sacrificed themselves in holding the pass for Europe.

But take away that balancing weight of Russia and things become very grave indeed. The enemy judges that the balancing weight has gone. He is probably right. Those now conducting or rather fomenting the chaos beyond the Eastern front are in a great number his agents and in a greater number his well wishers. He has upon the situation there a minute, detailed, daily knowledge which we wholly lack. Acting upon that knowledge he has determined that Russia no longer counts and that he can safely throw his weight westward. Hence this new Italian campaign.

There is here another calculation in the enemy's mind which we must appreciate. He argues thus:

"By my industrial superiority I compelled the retirement

of the Russian armies. I took very numerous prisoners. I inflicted very heavy casualties.

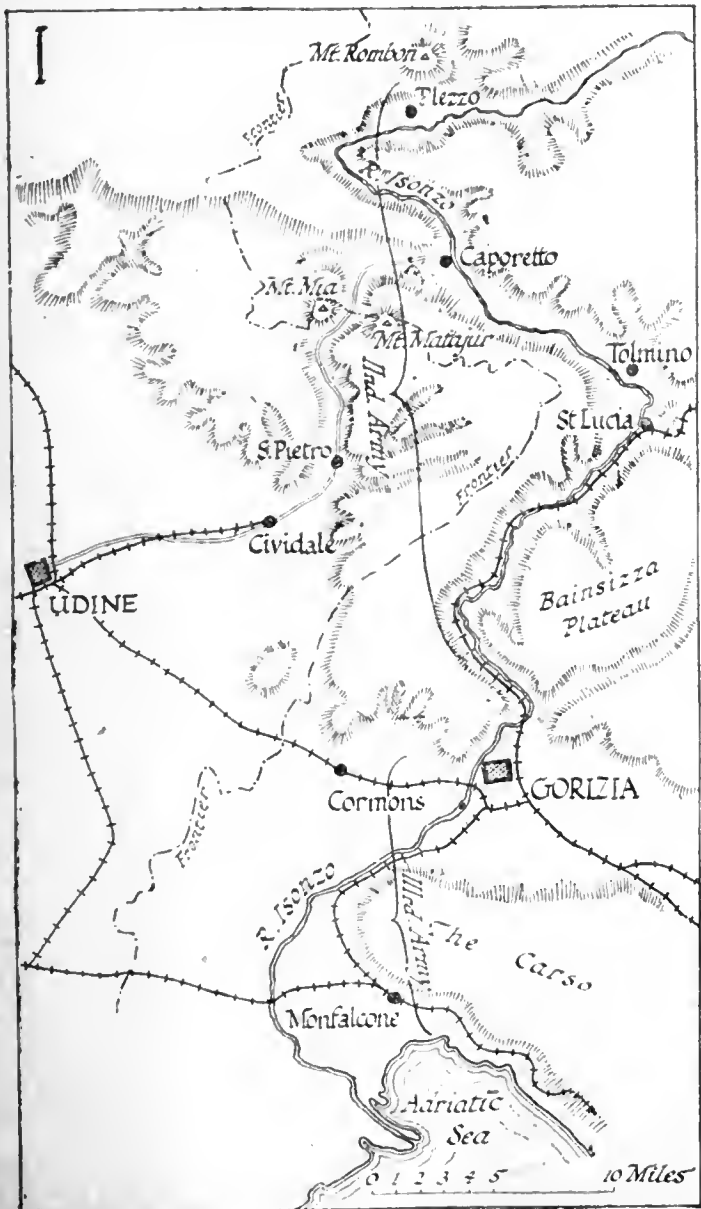

"As a result, I obtained—though I certainly did not expect it—a certain political effect which has all the value of a military decision. The Russian State fell to pieces. What had been its armies could no longer be used. The event was of the same military value as though I had succeeded in 1915, and had destroyed in battle the organization of the Russian forces. I had caused them, though only indirectly and after a political fashion, to dissolve. This lesson I therefore draw: Blows sufficiently heavy delivered against any people whose political tenacity is uncertain will result in the internal or domestic collapse of that people and the corresponding dissolution of their armies. The policy has succeeded against what was once the Russian Empire. It shall be directed against what is still the Italian Kingdom."

It is to be presumed or hoped that the enemy's calculation here is false. The political unity of Italy is recent. But the temper of an old civilisation threatened by barbarism is not a temper which the German understands as he understands that of the Russian peasant and town worker. The extreme of peril hardly dissolves a country the inhabitants of which have long and great traditions far superior to those of the invader. It is on the contrary, as a rule, peril in highly civilised countries which acts as the cement of the defence, even though that defence prove ultimately incapable of success. But whether the enemy be wrong or right (and we who know our ancient civilisation better than he does, think him wrong) that is certainly the enemy's calculation at the present moment. He is calculating on an ultimate count out of Italy in the forces opposed to him, and he makes of it in his mind something parallel to his former good fortune in the matter of Russia.

Let us clearly grasp all these points. Upon them the last phase of the war will turn, and with it the future of our race.

With so much said let us turn to the details of this great action.

Let me first premise that we have no accurate information upon the numbers either of guns or of men which the enemy has concentrated for his present effort in the foot hills of the Julian Alps. There has not been time or opportunity during such a disaster for a full identification, and the vague

estimates sent us are too imperfect to merit analysis. We must confine ourselves to the very meagre geographical details available at the moment of writing.

The story, as based upon the slight evidence so far available, would seem to be somewhat as follows:

On Wednesday last, October 24th, after a preliminary bombardment of great violence, the main infantry attack of the enemy was launched upon a front of about 20 miles, extending from the northern edge of the Bainsizza Plateau northward, say, from St. Lucia, south of Tolmino to the Rombon Mountain above Plezzo. The enemy had a bridgehead over the Isonzo at St. Lucia, an important meeting of road and river valley just south of Tolmino. He used this bridgehead and here pierced the Italian line first, though almost simultaneously he secured his crossing twenty miles to the north of Plezzo, just under the mountain just mentioned called Rombon, which dominates the little enclosed Plain of Plezzo and the Isonzo valley by just under 6,000 feet.

There is no doubt that the Italian front in these two points gave way on Wednesday last. The line having given way at the two river crossings at either end of its length, the centre was lost and everywhere the foremost positions of the Italian second army were crushed in against the river and destroyed. The enemy claimed by the Wednesday evening no less than 10,000 prisoners.

We were told at the time that initial successes of this kind could always be gained by any determined modern offensive, if it chose to suffer the necessary expense, and with this comment opinion was apparently lulled. But the comment was inaccurate and the suggestion false, for much worse news was to come.

On the next day, Thursday last, the 25th, retirement from the recently conquered Bainsizza Plateau was imposed upon the forces of our Allies by the advance of the enemy on the north outflanking them. Though a simultaneous attack was taking place to the southern end of the Italian line in front of Gorizia and upon the Carso, this was probably only with the idea of containing the Italian forces there. Meanwhile in the north the overwhelming success of the enemy's surprise continued. He crossed the Isonzo everywhere, the thrust in the early morning of that Thursday up the mountain slopes beyond, swamping the defence. He seized the summits and already overlooked the plains.

There was a general retirement of what was left of the Italian second army on to the frontier line all the way from Auizza to the Monte Maggiore, and by the evening of that day, Thursday, the enemy claimed 30,000 prisoners and 300 guns.

On Friday the movement continued and the news became very grave indeed. The summit of the Monte Matajur had already been captured with the other summits on the Thursday in the morning.

Now the Monte Matajur with its twin peak the Monte Mia overlooks the Coporetto-Cividale road which runs between them by a low pass. By Friday he commanded that road and was pouring down it towards the plains. It is not yet clear at what exact moment the heads of the enemy columns succeeded in debouching upon the plain—an act which was the consummation of the whole affair. He was, at any rate, the master of the watershed by that Friday night, and at that

moment he claimed double the number of prisoners he had counted the day before, setting the total number at 60,000 and the total of guns captured at 450.

We need do no more at this point than ask the reader to consider what such figures and such an advance already mean.

In three days fighting the Italian mountain positions along the whole of the sector had gone. The Second Italian Army, or what remained of it, was back upon and beyond the front line, and approaching, or perhaps in places already touching, the plains. And even if we allow for some exaggeration in the enemy figures, we note that there has been no contradiction of them from Allied sources, and we further note that so considerable an advance over so wide a sector corresponds well enough with numbers claimed. What a movement of this sort in three days would mean upon the Western front I leave it to my readers to decide.

By Saturday last, the 27th, it was unfortunately clear that the enemy had achieved something nearer a decision than anything yet accomplished in this war upon either side, and a survey of the situation according to the fuller news available on the Sunday night and Monday morning showed what had happened.

The key to the whole business has been, as we have seen, the forcing of the Pass under Monte Matajur, which feat was accomplished by the enemy in the course of Thursday and Friday.

Up to that time there had been indeed a defeat of Italian forces in the bend of the Isonzo. The enemy's advance, and especially his superiority in guns, had carried him to the crest which runs like a wall above the plain of Friuli; but everything still depended at that moment upon whether he could master that wall or not.

He succeeded in mastering it and the gate through it, as a result of his capture of the mountain heights upon either side of the road from Cappretto to Cividale, and of its valley down which flows the Natisone torrent. In the course of Sunday the Austro-German armies were fully deployed upon the Italian Plains.

The enemy claimed on Sunday 100,000 prisoners and 700

guns—that is, the complete destruction for military purposes of the Second Italian army front. He had restored a war of movement for the first time in the West as he had restored it in the East when he broke through the Russian front in Galicia two and a half years ago.

He had turned the whole of the remainder of the Italian line between the mountains and the sea. He had compelled the rapid retirement of the third army, the evacuation of Gorizia, and the falling back (though in good order) of all the troops from that point to the Adriatic. He had entered the first Italian town standing at the edge of the Plain at the foot of the mountains Cividale. Cividale is only ten miles from the old headquarters at Udine, and Udine is the essential nodal point through which all the communications of what was once the Italian-Isonzo front, now ruined, pass.

The line upon which our Allies must now retire is that of the Tagliamento, or rather of the prepared positions which run parallel to that broad complex of shallow streams. For the Tagliamento, though it has a large catchment area up in the mountains and discharges into the sea a considerable volume of water in the early summer thaw, is no considerable obstacle in itself. It is the only convenient line from the high Alps to the sea. A lateral railway runs (too near) along its course, and it has an excellent road system behind it. But there is no observation and the numbers required to hold that open plain will be higher than those detailed for the original mountain front.

Of the future of this great operation still in progress we can say nothing. All we know is that the left of the Italian line has been shattered; the right, therefore, turned; the Plains entered and the armies of our Ally at once in full retreat and summoning such reinforcements as can be obtained from the points further west.

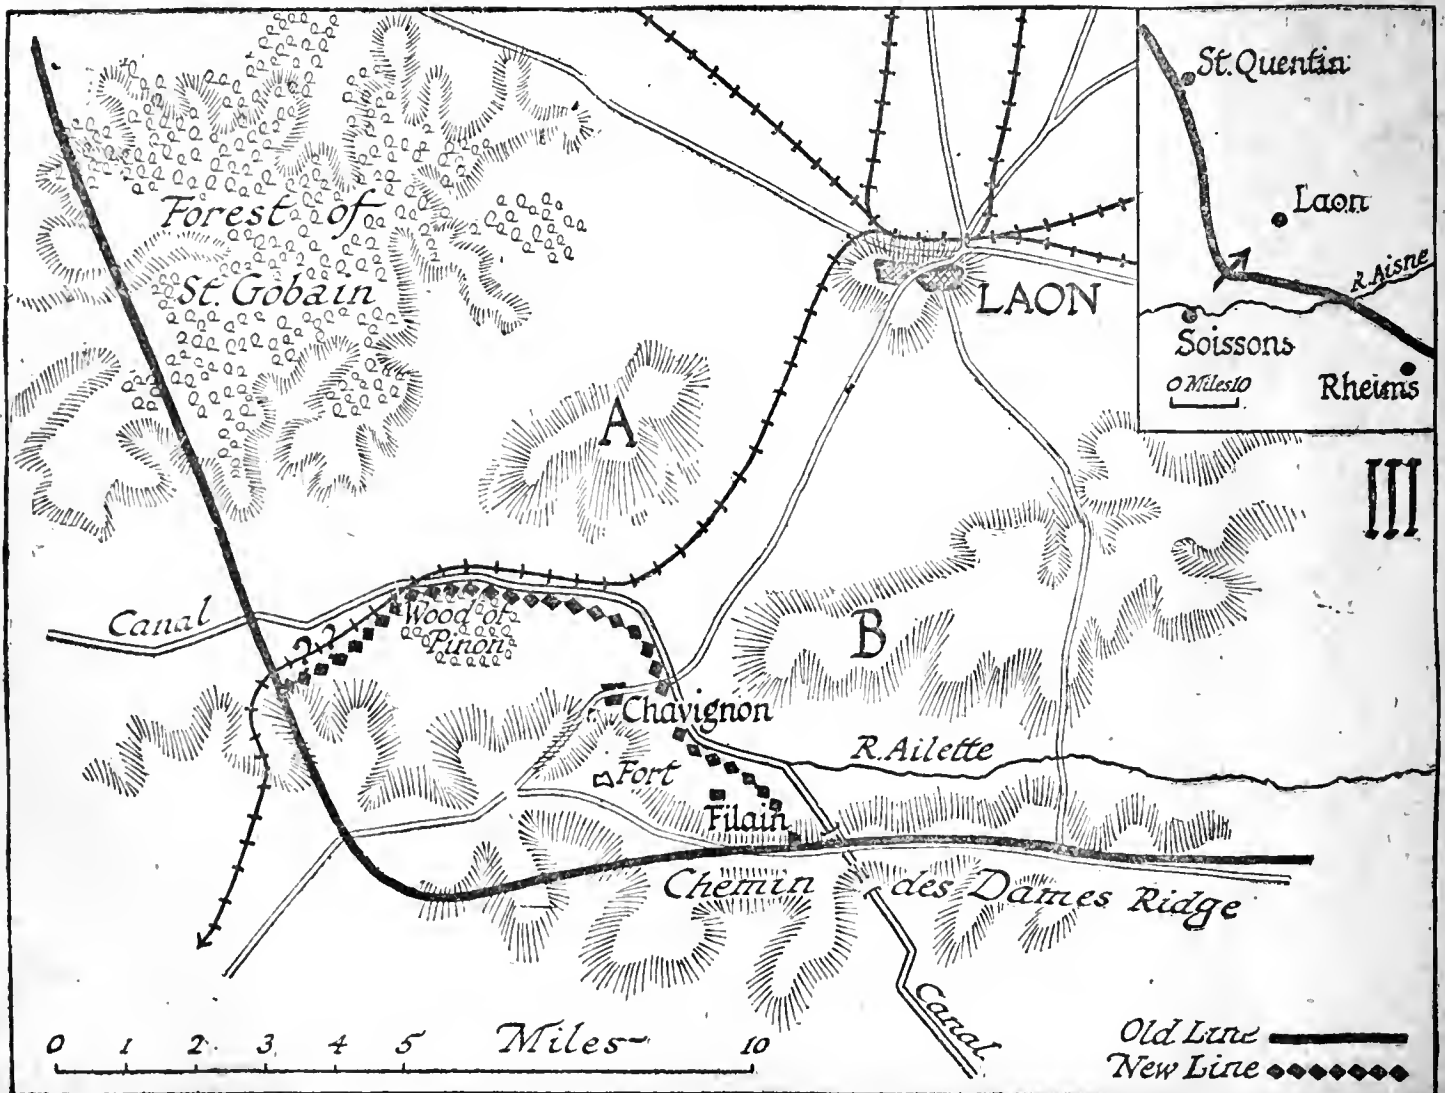

[The gravity of the situation created by the Italian defeat is indicated in Mr. Belloc's article: but we are not permitted by the Press Bureau to publish all his conclusions.]

The French Victory on the Aisne

Earlier in the week the French in a highly successful action had shown once more that on the North-Western Front the Allies, through superiority both in material and the present spirit of their troops, could break into the enemy's lines

at any chosen point, though that, of course, only after long preparation.

The point chosen was the elbow of the great angle made by the German lines in Northern France, and the value of an

attack here lay in the fact that if this elbow can at last be thoroughly smashed a general retirement will be inevitable.

This elbow relies for its strength upon three features, and has for its centre of communication the hill town of Laon. The three features of its strength are the difficult high forest country of St. Gobain, the Eastern end of the Chemin-des-Dames ridge (the continued possession of which by the enemy shut off observation on to Laon with its roads and railways), and lastly two heights lying behind, that is, on the Laon side of the Chemin-des-Dames ridge; heights marked A and B on Map III. A is an isolated high hill called the Hill of Bourgignon; and B is the ridge parallel to the Chemin-des-Dames, lying over against it beyond the valley of the Ailette.

Full success is this quarter would mean the occupation of this ridge, B, and of the isolated Hill, A, with the consequent turning of the great obstacle formed by the forest of St. Gobain. With these heights in the hands of the French, the Plain of Laon (out of which the town rises precipitately and isolated) its roads and its railways would be at the mercy of the French line, and a general retirement would be necessary. What was attempted and achieved last week was less than this, or perhaps only a preliminary to it. But the completeness of the success was none the less remarkable. The French started from a line everywhere to the south of the watershed on the Chemin-des-Dames ridge, and nowhere possessing a view of the plain towards Laon. After the preliminary bombardment in which the accuracy of the heaviest pieces up to 16 inches was remarkable, the infantry was launched before dawn, at a quarter past five on Tuesday, the 23rd, upon a front of rather over five miles. The strongest point in front of them was the big ruined lump of Malmaison Fort, an abandoned work of 1875, which had been turned into a very strong point by the enemy. Further, throughout these limestone hills were deep quarries, both cut into the surface and underground, which the enemy had strongly organised. By Tuesday night the number of prisoners counted was 7,500 and 25 guns, many of them heavy. The extreme French advance had reached the village of Chavignon which lies on a spur overlooking the valley of the Ardon with a direct view of Laon seven miles away, and the remainder of the broken German divisions were cooped up between the hills and the line of the canal at their base. It was remarkable that no attempt to counter-attack followed this considerable success. By the evening of the next day, Wednesday, the total number of prisoners brought in had reached eight thousand, and the number of guns seventy. On the same day a statement was issued of the German forces which had been engaged and defeated. There were five full divisions, the 14th, and 13th; the 2nd, 5th and 4th of the Guard, the 4th being held in reserve until the end of the action. Portions of two more divisions, the 37th and the 47th Reserve, were thrown in on the extreme left and right, and it was the Guards who had the task of defending Malmaison, and who suffered the heavy losses in prisoners consequent upon its capture.

With the succeeding day the Germans retired behind the line of the canal. The number of prisoners collected continued to increase. By the Thursday evening, the 25th, there was a total of over 11,000, and not less than 120 guns.

The general effect of this success is twofold. First, it gives full observation of the main road and railway supplying the German front here from Laon, along the valley of the Ardon, with a certain advantage in distant observation of Laon itself, and its approaches seven miles away. But, of

course, at such ranges modern artillery depends upon aircraft much more than on direct observation. Unfortunately, also the great nodal point of all communications here, the railway junction under the hill of Laon, is on the far side of the hill and town.

The second advantage gained is the power from the spur of Chavignon, and from the Malmaison Height, of looking right up and dominating the Ailette valley. It is possible or probable that the present positions of the French will make that valley untenable, and will compel the enemy to retire on to the ridge marked B, the last of his defences in this region.

Friday and Saturday passed without any attempt at re-action upon the part of the enemy; the gains were finally consolidated by the French and the situation settled down.

An interesting point in the details of the fighting was the discovery by the French that the cutting off of German supplies by the preliminary bombardment had compelled the enemy to help re-victual his front lines by the use of aircraft.

THE BRITISH FRONT

The third of the actions to be noticed this week was the sixth blow delivered by the British Field Marshal for the capture of the Passchendaele Ridge. It was undertaken against very difficult weather conditions and followed the lines with which the last operations on this impossible ground have made us familiar.

These weather conditions must be specially mentioned, because in this case they were even worse than had previously been known. The limited objectives chosen for the new advance were fixed while the weather was still fine, and with a good drying wind which had marked Thursday, the 25th, but with the night rain began to fall, and fell all during the attack of the 26th: "Heavy rain without a break since a very early hour of the morning." The French on the left wading through the swamps and the water course in front of Houthulst Forest up to their shoulders, took the ruins of Draibank, entered the Paggoed Woods and accounted for about 100 prisoners. The British forces gave their main thrust on either side of the Roulers Railway, English and Canadian regiments combining here, and the latter establishing themselves upon Hill 56, just outside the ruins of Passchendaele. The fighting was heavier and more difficult outside Poelcapelle where Canadian battalions and an English Naval Brigade and certain battalions of the London territorials were engaged in exceedingly difficult ground. There was heavy fighting also on the extreme right in front of Gheluvelt, resulting in the clearing of Polderhoek Chateau.

The next day, the Saturday, the French advancing again at a quarter past 5 in the morning on both sides of the Ypres-Dixmude Road, advanced about 2,000 yards and captured the ruins of the villages Verdrennesmis, Ashoot, Merckem and Kippe. There was no infantry action by the British on that day. The total of prisoners captured in the two days were reported by the Field Marshal at 1,100, of which three hundred were accounted for by the French.

In the same record Sir Douglas Haig mentions two heavy counter-attacks made by the enemy on the Ridge itself on the Friday afternoon south and west of Passchendaele, and the successful repulse of these attacks by Canadian troops who took further prisoners.

H. BELLOC

Russia the Incomprehensible

By Charles Edward Russell

This article was written in Petrograd by an American writer a few weeks ago. It gives a good idea of the almost incomprehensible chaos now prevailing in Russia. At the time of writing the author evidently hoped that the country and the people would have settled down to a reasonable and orderly system of Government, but this hope has not yet been justified.

RUSSIA: a vast, dimly lighted stage whereon we know some tremendous new drama is being enacted, but where all the actors seem to be running about inconsequentially as in a maze without plan or meaning. Something like this, I suppose, if we were to speak up with delectable candour, is about the impression most of us have had about this wonderful country ever since it tumbled the last of the Romanoffs from his ancient seat. Yet the keys to the play are, after all, simple, and to be found in simple events, and when we have found them, behold a most fascinating and moving drama.

There is a place on the Trans-Siberian Railroad called Passing Point Number 37, a brown little speck on the illimitable

emptiness of the Siberian plains. On May 23rd there came marching up to it a procession of farmers—about forty of them, I think—carrying red flags. They tramped solemnly along what in Siberia, by a violence of speech, is called a road, and is in fact not otherwise than a trail of ruts in black-gumbo mud. A passenger-train was coming from the east, from Vladivostock. At Passing Point Number 37 it took the sidetrack to wait for the train it was to meet. According to Russian railroad practice (which you might think a precept of religion punctiliously observed) the operation of getting these two trains past each other was to take up one half-hour, liberally inundated with swift and cheerful conversation. Some of the passengers got out and swelled the verbal freshets. They talked with the peasants of the procession; the peasants responded with undiluted pleasure on their brows. It was after the Revolution; more than two men could talk together without being prodded by a superactive *gendarmerie*; and the springs of speech, frozen for three hundred years in Russian breasts, burst forth into grateful and tireless fountains.

Of a sudden the processionists were seen to line up in front of the baggage-car, to fall upon their knees there, to lift their

hands in attitudes of prayer, the while they muttered strange wailing cries and many wept. What were they crying about? They had learned that in that baggage car were the ashes of a Russian revolutionist, an old time hero of the long, long struggle. He had been condemned by the Czar to one of the worst prisons of coldest Siberia; he had managed to escape and in the end to get to America. There he died, and his body was cremated. Now his ashes in a draped memorial urn were being carried back in state to that free Russia he had dreamed of and suffered for. But note:

Of the peasants that fell on their knees before that handful of dust that day about one half could not read. All of them, you might think, lived in a region farther from the world and its affairs than is Cape Nome from the Bowery. Yet all of them knew well enough the name of this dead hero and all his deeds, and instinctively all knelt before his ashes that they might testify at once to their reverence for him and the fervour of their own revolutionary faith. After which there were speeches. If you know Russia, the New Russia, Russia of the unchained tongue, the information is superfluous. To know that there was any kind of a meeting anywhere at any time is to know that there were speeches.

But what did that procession mean, wandering red-flagged along the black ruts of lonely Siberia? It meant that the peasants were making a "demonstration." Demonstration about what? Why, if you will believe me, against the Austrian Government's sentence of death against Frederick Adler, slayer of the Austrian Prime-Minister! And there you are; that is Russia. I offer you herewith the keys to the play.

Passion for Demonstrations

Because you find in this one little incident these things, perfectly typical, truly fundamental: The Russian temperament and character, emotional, sympathetic, altruistic, generous, and quite indifferent to conventionalities: The passion for "demonstrating," the tremendous impulse to let go with the feelings brutally suppressed so long by the monarchy now dead and gone, to thank God for his infinite mercies: The passion for oratory: The warm, naïve and somewhat dreamy feeling for the universal brotherhood and the sense of a world-wide cause.

That there was anything incongruous about a demonstration in Russia by Russians against Austria's execution of the death penalty upon an Austrian in Austria at a time when Russia and Austria are at war would never occur to them. Are not the workers of Russia, Austria, and all other countries brothers? Is not a wrong done to a member of the proletariat in Austria the affair of members of the proletariat everywhere? Assuredly, comrades. Then let us demonstrate—even in remote Siberia, where nobody will ever know anything about it. Also, you may see in this incident how deep in the heart of every peasant and toiler are at least the rudiments of the Revolution's creed, how widespread is a fair understanding of the Revolution's history and meaning—spread even to the uttermost parts of this prodigious country, spread when there were no modern means of communication, when there were no public schools, no right of assembly, no free press and very little reading, and yet spread competently.

But perhaps it is no wonder that the world, sitting at such an unprecedented play, blinks and is doubtful. There was one day the imposing great structure of the most powerful autocracy on earth, centuries old, rock-rooted, Imperial and irresistible, cloud-compelling and remorseless. At a touch it crumbled together like the unsubstantial figment of a dream; vanishing without a trace, as if it had never been. Intricate, great systems of government, of police, of spies, of punishments, erected with long care and skill to keep the people down, all, all dried up and blown away like a mist, and behold these same kept-down people instantly and easily taking seats in a new machine, untried. No wonder, I say, some spectators gasp and are puzzled. To the rigid rectangular English mind, to the American mind that tries hard to be like the English, all this is not in nature. Truth to tell we have not much faith in popular intelligence; no Anglo-Saxon has. What there is of it, we feel, must be the product of long education, of training and of reading—much reading. But here is a country where only a few years ago 80 per cent. of the population could not read at all; where the few newspapers were frankly corrupted and fiercely censored by the monarchy. Yet out of all this, lo, a people—that alone are striving to steer the government.

Whatever you may read, or whatever you may hear about Russia, you may learn this—that what is done will be done by the Russian toilers and by them alone. Here democracy has been taken literally and without compromise. Here the conditions that exist in other countries with political freedom and the ballot-box have been turned the other way about. Here Labour does not take orders but gives them. All there is of Government in Russia to-day

is strictly working-class government, animated by about such impulses and convictions as caused the Siberian peasants to demonstrate against the killing of Frederick Adler and to fall on their knees before the ashes of a revolutionist. Under the red flag! I don't know but that the flag is the hardest fact for a conservative American and Englishman to swallow. With us it has always signified anarchy, violence, blood, riot and ruin. Here in Russia it is flying everywhere, over the most peace-loving people on earth. From Vladivostock to the Baltic and from Turkestan to the Arctic Circle, the simple red flag, without device or ornament, is on land the only flag you see. It has become the national flag of Russia. It is flying at this moment over the Winter Palace of the Czars, where I am writing, over the most sumptuous royal quarters in Europe, over these windows that looked down on Bloody Monday. In the great square in front of me five thousand men and women who asked for bread and freedom were shot to death with machine guns from these roofs, and now the red flag flies over it and a band that used to play "God Save the Czar" now plays the new national anthem. And what is that? The once-proscribed "Marseillaise!" On Sunday, July 1st, 300,000 people marched in this square with band after band that played nothing else; all day the strains of that revolutionary anthem echoed through the suites where Czars used to sit and condemn to the living death of Siberia men who had said a few words in favour of human liberty. Three hundred thousand free men and women tramped to that tune over the stones that in 1905 had been soaked in the people's blood.

When we begin to absorb that fact the drama ceases to look like inebriated chaos and begins to appear a totally new experiment in government—momentous, perilous, if you like, but reasonable and wholly logical. What they mean by democracy here is direct government by the people, the great majority of whom are the toilers on the farms and in the factories; no "checks and balances," no artificial barriers to defeat the popular will and ensure government by property; exact political equality for all, universal suffrage; women at last free from the surviving disabilities of the jungle, men freed from the political relics of feudalism. At one leap democracy goes far beyond all its previous achievements. A new country is launched with new ideals and new purposes, and the world must rub its eyes and awake to the new birth. It is so; I do not exaggerate. Snobbery is in the bones of us; that is why we do not appreciate the wonderful things done in Russia. We have not only failed to see it, but by some trick of legerdemain some of us have been able to fool ourselves into believing we have a call to be the patient instructors in democracy to these well-meaning but deluded creatures. Nobody who has ever been to the Cadetsky Corpus has any such phantasms, believe me.

Take a trip down there with me and see what you think of it. The Cadetsky Corpus—that means the West Point or Sandhurst of Russia; the vast, wandering pile that used to be the officers' training-school for the Russian army. In the great hall of this institution now meets the National Council of Workmen's, Soldiers' and Peasants' Delegates, the only source of government and authority, and so far the only organised expression of the popular will in Russia. It is, in effect and for the time being, the National Congress. On the basis of population the country was divided into districts, and each district elected a delegate.

The low, plain white building has a street frontage of a quarter of a mile—all public buildings in Russia have spacious ground plans. They take you through an entrance crowded with working people and with soldiers of the ranks, and then down one long corridor after another by the side of the old parade-ground of the cadets. The first thing you notice is that you are passing an enormous room filled with plain iron cot-beds. What are they? The beds of the delegates to the Council. To save time and money they sleep in the building—on the old beds of the cadets. Next they take you into the basement and show you crude pine tables, rough benches and men being served thereon with the simplest of food. What is this? It is the delegates' dining-room. To save time again—as well as to save money—they eat in the building. They mean business; they are not here for amusement. They have need of all the time they can save. Sometimes the sessions begin at 11 o'clock one morning and last (with brief recesses) until 3 o'clock the next.

In the language of Baedeker, we now return to the first floor, where we find at twenty stands busy and comely young women selling great piles of books, pamphlets, leaflets, propaganda literature. What is all this? The works of Marx, Engels, Kautsky, Unknown This and Unknown That, an astounding variety of names the most of which you never heard of, but all preaching revolution and radicalism, political, social, industrial. Does this stuff sell? It certainly does, that is the strange thing; the stands look like a popcorn booth at a country fair. The floor is littered with the wrappers

of bundles, the clerks rake in money with one hand and deliver the books with the other. Dry is the reading, God knows; drier than the autumn leaves of Vallombrosa, but these people eat it up. Strange people! They buy also large gobs of what they are pleased to call newspapers. With the Revolution all restrictions fell as a garment from the press, and there came forth an unfathomable flood of journals.

Flood of Newspapers

Every party, every faction, every group and every man with a hobby got a press and began to issue a journal on it, so that Petrograd has now more newspapers, so-called, than any other city in the world. In most cases the name is grotesquely misapplied. There is no news. The thing is made up with a capable paste-pot, a pair of over-worked scissors and one long-handled pen that produces (at inordinate length) the thoughts of some beetle-browed intellect on street-paving, for instance. But these people buy that, also, and read it, and seem to like it. Heaven help them! And then talk about it until four o'clock in the morning. Disquisition—it is the breath of life to them. Everywhere else in the world the long-winded editorial writer is far on his way to join the mastodon, the buffalo and the great auk. Here he is in the full pride of his glory, swelling the chest of achievement and breathing forth sound and fury—also guff.

At the top of the stairs is the long, long hall, one of the longest a man ever spoke in, where the delegates meet. Once these walls were adorned with the portraits of dead Czars and the flags of Imperial Russia. All are vanished now; ripped down with joyous acclaim on the day of the Revolution. In their place appears everywhere the red flag as the only decoration; except on the wall at the entrance end, where you read this motto, done in white upon red banners: "Workingmen of the World, Unite! You Have Nothing to Lose but Your Chains!" It seems to me I have heard something like that before, but few American readers of the literature of sociology ever expected to find that quotation emblazoned on the walls of any national legislature of our times.

The rear one-third of the hall is for the public. Delegates occupy the rest, 830 of them, seated at the transported old desks of the recent cadets. On the high, red-flagged platform at the extreme end sit the guests of the Council and its officers, including that redoubtable Tschaidse, the chairman, of whom the world is to hear further. At his left is the rostrum, a plain reading desk for the speakers. Sit up there and look judiciously over this historic gathering. These men represent all the organised power of Russia; they have its fate in their hands. At their will Ministers resign, Governments rise or fall, armies move, policies are shaped, the fate of the race is decided. Observe them well.

It is the most extraordinary legislative body in the world, or that ever was in the world. The National Assembly of Revolutionary France? Nay, that was, after all, a middle-class affair; advocates like Robespierre, journalists like Desmoulins. But this National Legislature of Russia is composed exclusively of persons that work with their hands or are so closely in touch and sympathy with labour that they are a part of it. It is not easy to realise all this, but try—try hard. It will enable you to understand New Russia.

Three in four of the delegates wear the uniform of the Russian soldier, the seemly, well-fitting tunic, the belt, the high black boots; even in the breathless hot days of July, the high black boots. Seeing the overplms of these uniforms before us you jump to the conclusion that this is a military body; all newcomers here get that notion. It isn't military. But military service in Russia is universal and compulsory. These uniformed men are not only soldiers; they are farmers, factory workers, day labourers, carpenters, stonemasons, who had been called to the colours and were wearing the uniform of the service when they were elected to the Council as workers and by workers.

There is another common delusion to the effect that the Council represents only Petrograd and the district thereabout. In truth it represents every part of Russia, even far-away Asiatic Russia. Only thirty of the 830 delegates come from the Petrograd district. Among the rest are fishermen from the Lena River, swartly cattle-men from the Crimea, and everything between. Five of the delegates are women. Suffrage is universal in Russia. In Russia, suffrage for women was achieved in a moment and without discussion. It was taken as a matter of course. Here in Petrograd the other day the Petrograd Yacht Club received applications for membership from two women. I hardly need to say that in the old days such a thing, if conceivable at all, would have caused strong hearts to faint and police spies to discover new candidates for Siberia's chilly wilds. But now the point was raised at once that since the Revolution men and women in Russia are upon a level of exact equality, and that automatically women had become eligible for any organisation that

admitted men. The point was held to be well and truly taken and the women were voted in.

They know what democracy is and they know how to operate it. A few days ago they had an election in Petrograd—an election for the new City Council. There was universal suffrage; about six hundred thousand people for the first time in their lives used a ballot-box. I went out to see it and had a great show. The whole thing moved like clock-work; you would have thought these people had been voting all their lives. There was a registration list, a committee composed of soldiers, working-men and householders to manage the polling-places and scrutinise the voter's right; there was no disorder and no confusion and no discoverable chance for fraud. The polling-place was invariably some public building. Frequently it was on the ground floor of some old Grand Duke's palace. Women went in and voted with ease, dignity, and methought, a quiet but ineffable satisfaction. There were seven different tickets in the field. Each voter was provided at his house with a copy of each ticket, duly certified. The end of the ticket was perforated. At the ballot-box the voter was checked upon the registry list, the perforated end of his folded ticket was torn off, officially stamped and spiked, and he put the rest into the box. There were cast in the city 722,000 votes; total population a little more than 2,000,000. Of the 722,000 all but about 140,000 were cast for the candidates of parties that propose the most sweeping changes.

The National Council

But to come back, once more, to the National Council. It is, as you plainly see, of working-men and working-women. All the spectators are working-men and working-women. You are one of perhaps seven persons in the huge hall that wear starched collars. The other six are among the correspondents and reporters that sit right and left of the platform. Look over these thousands of serious, intent faces gazing hard at the dais, drinking in every word that falls from any speaker. They sit silent; they will not miss anything. Those at a distance make ear-trumpets of rolled-up newspapers; they are intolerant of the least movement or noise that causes them to lose any precious crumb of the proceedings. Here is the proletariat of Russia, hands upon the levers. No man can despise them now; with a breath they blow Ministers in or out. In the hall where long lines of gorgeous dead Czars used to look down from the walls, and gorgeous living Czars used to watch military training of gracious youth of the governing class, and all things seemed comfortably settled forever, ploughmen and teamsters sit and debate whether Nicholas Romanoff, now a prisoner of State, shall be allowed to vote like other citizens.

On the floor the delegates are ranged from Left to Right according to their politics; which means, according to the intensity of their revolutionary fervour. But as you move to the Right the temperature falls. On the extreme Right sit what are called the Conservatives. These are men that in the United States would be looked upon as extremely dangerous and to be blacklisted by a respectable press. They believe in the Revolution, but think it has already attained to most of the objects it desired. Between the extreme Left and the extreme Right is the real driving force of the Council, the men that want the Revolution to sweep on and do many more things that ought to be done, but are unwilling to see it miscue and lose what it has already gained. That is, they want all that can be had out of this thing, but they are not plumb dead to reason about it. Left and Right mean looking from the platform; it is the chairman's left or right.

To those gentlemen on the extreme Left are the notorious Bolshevics, once with Lenin for their leader. The Menshevics occupy the Centre; next to them come the Trudevics and then come the men on the Right.

I think there is a man in Russia that can name all the Russian political parties and give a succinct account of what each stands for. I know there is a man in Russia that can play ten games of chess blind-folded, and therefore I am prepared to believe in the existence of even a greater intellectual prodigy. But I never saw him nor heard of him, nor heard of anybody that had heard of him. In a general way, the average visitor is able to garner the precious fact that there are a great many parties, and the differences between their principles is often very slight, but beyond that the water begins to shoal rapidly. I know in a general way that among the important parties there is first the Social Democratic Party, then the Social Revolutionist Party, then the People's Socialist Party, then the People's Liberty Party, then the Cadet or Constitutional Democratic Party, and then others that are like the sands of the sea for multitude. The two great parties of the country are the Social Democratic and the Social Revolutionist. So far as the finite mind can learn they have practically identical creeds.

Alsace-Lorraine and the Rhinegold—II

By Philippe Millet

I ENDEAVOURED to show in my last article (LAND & WATER, October 25th) that the huge iron deposits of Lorraine, a sort of modern Rhinegold, are the stepping-stones of Prussian Imperialism. Two-thirds of the iron ore which Germany extracted from her soil before the war came from Lorraine; the same mines have provided during the war (with Luxemburg) 80 per cent. of the ore used for manufacturing German guns and munitions. There is, therefore, no exaggeration in saying that Prussia will keep her claws uncut either for waging a new war or for competition in the industrial field, as long as she will not have been compelled to surrender Alsace and Lorraine.

"It is all very well," some may say, "to give back to France the treasure Prussia stole in 1871, but can we be sure that by giving back to France that ominous possession we will not endanger the future peace of the world? An evil spell has evidently been cast upon Lorraine, over which Germany and France have now been fighting for centuries. Suppose France attempts to starve Germany industrially by refusing to let her have a share in the treasure, is there no practical certainty that Germany will be more or less compelled to resort again to all sorts of tricks, including war, in order to wring the Lorraine ore from her old enemy?"

These are perfectly legitimate questions. My answer is that by enforcing a certain economic policy, the Allies have the means of removing the curse attached to the wealth of Lorraine. Roughly speaking, this policy ought to consist both in allowing Germany a fair share in the ore extracted from the soil of Lorraine and in opening Lorraine to the whole world. Moreover, such a plan is commendable equally from the point of view of French interest and of British tradition.

Looking first at the matter from a purely French standpoint, the danger is not so much that France might be induced to starve Germany of the Lorraine ore as that, unless she takes certain steps, the possession of Lorraine may reduce her to a state of economic dependency in regard to Germany. The reason for this is that you cannot manufacture iron and steel without coal. Now the position of France as regards coal was already a difficult one before the war, as out of about 80 million tons of coal she consumed every year, she had to import 21 from abroad, including ten from Great Britain and seven from Germany. Once Lorraine is again French, the coal problem will be more critical still. Of course, France may make a better use of some of her natural resources, such as water-power. The coal deposits of the Sarre valley will also somewhat relieve the pressure if France recovers her frontier of 1814. Taking all this into account, it remains, however, that an enormous increase in the output of iron ore will necessarily correspond with an enhanced demand for coal. According to one of the best French experts, M. de Launay, France may have to import from Germany, instead of seven million tons a year, not less than 22 million tons of coal.

In order to grasp the significance of this apparently harmless figure, let me quote again part of the secret memorandum which the German manufacturers submitted to the German Chancellor on May 20th, 1915:

Already, to-day, as the prohibition of the exportation of coal made by the English on May 15th proves again, *coal is one of the most decisive means for exerting political influence.* The industrial neutral States are compelled to submit to those of the belligerents who can provide their supply of coal. We cannot do it sufficiently at present, and we are compelled to resort to the production of Belgian coal in order not to allow our neutral neighbours to completely fall under the dependency of England. (the italics are mine)

There is evidently some unconscious humour in such a statement. So far as Lorraine is concerned, the German manufacturers have been kind enough to give us in time a useful warning. Supposing Lorraine remains entirely dependent on Germany after this war for its coal supply, what would be the consequences? In the first place, the monopoly enjoyed in that vital part of France by German coal-owners would enable them to exert over the whole of the French metallurgy what they call "a political influence."

Fortunately, there is one way out of the dilemma. Up to now, Lorraine, owing to the cunning policy of Prussia, has been secluded from the rest of the world. British coal could not reach it owing to the cost of transportation. Things would, however, be very different if Lorraine were connected with the open sea by means of convenient waterways. Two measures are necessary for that object. The rivers Moselle and the Sarre must first be deepened from the industrial region of Lorraine down to the Rhine: an easy undertaking, the aggregate cost of which would not, according to German

calculations, go beyond the trifling sum of 67 million marks. The second measure would be of a diplomatic nature, and would consist in making the Rhine a free waterway for the ships of all nations. Once those two things were done, it would become possible for a British barge to take a load of coal from Newcastle to Thionville and come home with a corresponding load of Lorraine ore. The spell would then be broken. The Westphalian manufacturers would still buy a good deal of French ore in exchange for their coal and coke. They would cease, however, to enjoy a dangerous monopoly. A kind of industrial balance would be created for the common benefit of France's Allies and friends as well as for her own.

A Free Rhine

There is no doubt that France intends following such a course. Already before 1870 she had started canalising the Moselle, and it was not her fault if Prussia did not abide by the clause inserted in the Treaty of Frankfort by which she undertook to proceed with that canalisation on German territory. Moreover, although the industrial problem of Lorraine has been much discussed during this war, there has not been one voice raised in France against the resumption of the old French policy. Suppose even the free navigation on the Rhine cannot be enforced in the peace treaty, the opening of Lorraine will be undertaken in another direction, by means of canals dug across the north of France. Politically as well as industrially, France's obvious interest is to free the Lorraine ore from the German bondage by making it accessible to other nations and, before all, to Great Britain.

But not the least interesting feature of this economic plan is that it is in close agreement with one of Great Britain's own traditions. Very few people seem to be aware that it was England who first raised the question of free navigation on the Rhine. The matter was debated in 1815 at the Congress of Vienna. Curiously enough, while the French delegate, the Duke of Dalberg, and the Prussian delegate, Baron von Humboldt united their efforts in obscuring the issue, an amendment was drafted on February 18th, 1815, by Lord Clancarty, the British delegate, with the object of making it plain that henceforth an equal treatment on the Rhine was to be granted to all nations, and not only to neighbouring nations. The amendment was defeated. In spite of that, England's interpretation of the Vienna Treaty was that the Rhine was a free European waterway. Holland having in 1819 put high customs duties on the Waal, a diplomatic controversy was raised by England at the Vienna Congress in 1822 and went on for years, Prussia being of course most hypocritical.

The question is: Will England be now as indifferent to the question of the Rhine as she was a century ago? From the mere point of view of the Lorraine problem, this would be surprising. It can scarcely be disputed that one of the main causes of the war in which so many Britons have laid down their lives, is to be found in the industrial condition on the left bank of the Rhine. I hope I have proved that in order to do away with the future causes of friction between Germany and France, the best way would be to give to all nations free access to the iron deposits which will be soon restored to the French but which Germany will not cease to long for. The navigation of the Rhine is therefore more important than ever to England as well as to France.

It may be said in conclusion that the industrial side of the Alsace-Lorraine problem affords the clearest possible illustration of what the economic policy of the Allies ought to be in general. Many people who had never so much as read the famous resolutions voted by the Paris Conference in 1916, seem to have been for a time under the impression that the Allies, and more especially France, intended to wage a permanent economic war against Germany. As a matter of fact, no sensible man has ever contemplated starving out Germany after this war, the only object of the Paris Conference having been to prevent Germany from resorting again to her methods of aggressive industrial imperialism. The same principles hold good for the Lorraine question. It would be mere folly on the part of France to decide that, once peace is declared, she will abstain from selling to Germany a single ton of ore or to buy from her a single ton of coal. On the other hand, it would be equally unreasonable to allow French metallurgy to be so closely tied up to the Westphalian coal owner that the iron deposits of Lorraine would be only nominally free from the Prussian yoke. A solution must be found which will enable France to prevent Prussia, if need be, from piling up again ammunition in view of "the next war." That solution must have an international basis.

Italy's Hour of Trial

By Lewis R. Freeman

Mr. Lewis Freeman has had during the last two years exceptional experience of Italy. He resided in Rome for several months last winter and enjoyed the friendship of a number of prominent officials, some of them members of the late Government. Last December and January he passed some weeks on the Italian front, and has only recently returned from a tour which took him to all parts of the Italian operations during July and August this summer. He therefore writes with intimacy of the actual conditions of Italy, civil and military.

STAGGERING as are the military results of it, there can be small doubt that the longer objective of the present Austro-German offensive on the Upper Isonzo is political, in short, that it aims, through the infliction of a decisive defeat on the battlefield, so to weaken what the enemy has recently repeatedly referred to as the "shattered moral" of the Italian people, that they would weaken in their prosecution of the war or even be willing to consider proposals for a separate peace. Nothing less than a bid for such a stake could have induced the Central Powers to embark upon an operation of such magnitude at the very end of the practicable campaigning season. That such an eventuality is not considered beyond the realm of possibility even in Rome, would seem to be indicated by these grave words with which Baron Sonnino—on what was practically the first day of the Austro-German attack—addressed the Deputies in an endeavour to bring home to them the supreme gravity of the moment.

It is a question of the future destiny of Italy, and any error may be irreparable....The warmest upholder of peace must desire that the public order should not be disturbed, realising that any upheaval would retard peace and revive the belligerent spirit, at present depressed, of the Autocratic Empires....To demand an immediate peace is equivalent to asking for a peace of dishonour and shame, and betrayal of our Allies. It would also mean the complete ruin of Italy.

The Political Objective

It is my purpose here to discuss briefly the possibilities of the "longer or political objective" of the Austro-German offensive rather than the military situation, but a word parenthetically regarding the effect of local meteorological conditions on the continuance of the attack will possibly be of interest. The campaigning season on the Isonzo Front, while perhaps a month or two longer at each end than that in the High Alps, has been generally reckoned as coming well towards its close by the end of October. In 1916 the Italians struck, on the Carso, one of their most successful blows of the year in the first days of November, but from that time on until Cadorna launched his great double attack on the Upper Isonzo and against the Hermada, there was practically no action at all upon this Front. It had been Cadorna's intention last year to follow the November attack with another timed for from two to three weeks later, and everything was ready for the launching of a heavy assault toward the end of that month. After waiting, however, for thirty-five days, on every one of which there was a considerable fall of rain or snow, the attack was abandoned for the season, and the Front settled down to its comparative winter quiet.

The weather is, of course, much more severe on the Upper than on the Lower Isonzo, and the fact that snow has already fallen in the Julian Alps should have the effect of limiting the extent to which the enemy can develop his offensive as soon as he passes beyond the zone in which his communications have been prepared in advance. Mud will not be a serious deterrent in this theatre, for the roads—most of them blasted out of the solid rock—are practically "self-metalling" from the moment their grade is established. In this connection it is only too probable that the magnificent roads which the Italians have been constructing with so much skill and labour from the moment of their entry into the war may greatly simplify the enemy's problem of advance.

The people of the Allied countries have become so used to expecting exaggerations, misstatements, and even deliberate falsehoods in the speeches of German Ministers, that they paid rather less attention than was its due to the declaration of Michaelis, in his speech to Reichstag a month or more back, that there was a good deal of internal unrest in Italy. Nor were they especially concerned at the brief and casual reports tardily transmitted abroad regarding riots at Turin, Milan, Genoa, and several other industrial centres or ports of that country. Nor did the general public even attach especial significance to the news that, following these disturbances, martial law had been proclaimed, not only in all of Lombardy

and Piedmont—where the most of Italian war industry is carried on—but also in Calabria, at the southern extremity of the peninsula, and in a portion of Sicily. This latter action—in which the strong hand of Cadorna was plainly evident, and which was undoubtedly the best way of dealing with the situation—would hardly have been resorted to unless there had been something more than sporadic symptoms of unrest to contend with.

Bread Riots

As a matter of fact the riots of a month or more ago were serious affairs, especially those in Turin. Since the Italian censor has passed the statement in a private letter I received shortly after these disturbances from a friend who was an eye-witness of most of them, there cannot be any harm in writing now that machine guns had to be used in the streets and that the dead ran into three figures. "None but the rabble was concerned in these disturbances," wrote my informant, "and while their immediate cause might be ascribed to a temporary shortage of bread, their real cause was a train of vicious propaganda set going by a committee of Russian Socialists who were through here not long ago, and who seem to have tried to sow the seeds of discord all over the country. ... It is a significant, but unfortunate fact that none of the local instigators of the trouble exposed himself anywhere, or at any time, where the bullets were flying."

During the several weeks I spent in Italy last summer—when, after landing at Brindisi from Albania, I traversed by slow stages the whole length of the peninsula, spent a fortnight at the Front, and visited Milan, Turin and other of the northern industrial centres on my way to France—one sensed rather than saw evidence of impending trouble. The harvest had been uniformly excellent, and I was especially struck by the fine progress of the hard-working peasants of all parts of the country in getting on with the harvest in spite of the shortage of labour.

Most of the great industrial works of Lombardy and Piedmont had been extended since my last visit, six months previously, and I must confess that the great Fiat plant at Turin impressed me as one of the most remarkable munition works I had seen in any of the belligerent countries. Food, with the exception of sugar and butter, was fairly plentiful. The spirit of the men on all sectors of the Front seemed very high, though I do recall seeing a sign at the door of a big dug-out on the Carso which read, in Italian, "We want Peace!" The fact that the officers with me did not order it to be taken down rather gave me the impression at the time that the thing was more or less of a joke. One also saw, especially at the junction stations, a good many soldiers going back from the Front in irons, but this I had attributed to the open way the Latin has of doing things that the Anglo-Saxon would be inclined to hide.

Those in a position to get under the surface, however, saw trouble ahead, though none with whom I talked spoke quite so plainly as did the same gentleman whose words I have quoted above regarding the riots in Turin. "You cannot buy a ton of coal for heating in Turin for £20" he said, "and there will not be a pound obtainable at any price this winter unless something is done to increase the import. So far, the only provision that has been made for fuel to tide over the six months of often bitter cold we have here is a lot of wood, stacked all together in one block, where the first enemy agent that wants to can set fire to it by soaking a cat in paraffin touching a match to it, and letting it loose anywhere in that vicinity. It goes down to zero here at times, and you may take it from me that the people will start trouble unless something is done to enable them to keep warm."

"Again, take the question of food. You think because you can now get practically anything you care to order that the outlook is favourable. But that is just the trouble. Food has been more plentiful than there has been any warrant for. The Government have not looked ahead. Italy is not much of a cereal producing country, and I happen to be in a position to know how greatly the normal import has been restricted at a time when there is also a falling off of the amount raised in the country. This has already made it hard to get bread, but the real pinch will come when the macaroni supplies begin to run short, as they surely will by the autumn. Mark my word, the Italian Government—and all of the Allies are indirectly responsible—is skating on thin ice if it lets the one part of the country which furnishes practically all its war material—to say nothing of most of its best soldiers—go cold and hungry this winter."

From what I have gathered from letters which have come

to me during the last six weeks from all parts of Italy, both the food and the fuel difficulties—and especially the former—rapidly went from bad to worse during that period. This undoubtedly bred a discontent which furnished a favourable seed-bed for the pernicious sowings of the representatives of the Russian Revolutionists, whom the various Allied Governments seem to have allowed complete liberty of action in their efforts to extend to all the enemies of the Central Powers the same "blessings" that had proved so efficacious in paralysing the army and navy of their own country.

This discontent, deeper seated and more wide-spread than is even yet understood in any of the Allied countries, was directly responsible for the disturbances of September. The extension of martial law to those sections of the country where the disaffection appeared to be the worst was a drastic measure, but doubtless the only one possible under the circumstances. One does not know whether the conditions were such as to compel a withdrawal of troops actually in the war zone in order adequately to garrison the extended area over which martial law was put in force. Unless the disaffection had extended to the troops already in the provinces—no impossible contingency, however—it should not have been necessary to take men away from the fighting line. On the other hand, if this *did* have to be done, it would account in a measure for the Italian claim that they have been outnumbered four to one by the enemy on the Isonzo.

Value of Victory

With unmistakable signs of a weakening moral among certain elements of the civilian population, there was only one palliative (outside effecting an improvement in the trying economic conditions which were responsible for the trouble) that stood a chance of saving the situation,—it was the one which Germany has so often employed with such signal success to a similar end—a great military victory. Cadorna's drive for Trieste at the end of August had been ready a month before, and the delay in launching it was probably for the purpose of broadening its scope and increasing its chances of success. To understand how high were the hopes built upon this most ambitious of all Italian offensives, one does not have to go farther than the statement which Cadorna—who is noted for his conservatism and reticence—made to a Member of the Chamber of Deputies a day or two after the great blow was struck. He is reported to have said:

I may declare without boasting that the present manoeuvre, owing to its vast objectives and its daring and its probable effects on the whole war, is one of the most important in the history of that war. . . . Our offensive comprises such an extensive front that it would be impossible, except for the simultaneous success at all points; but the country may rest assured of our final success. . . . The imminent and decisive success of Italy over her traditional enemy means the turning point of the whole war.

A letter which I received from a correspondent at Italian General Headquarters at this time, even though it was written after it appeared (as was indeed the case) that the Austrians had the advance blocked at all points, spoke of this offensive as "one of the really big things of the war," adding that it was "just beginning," and to "wait for the next move." That next move, sad to say, when it did come, was launched from the opposite direction. As to just what went wrong one can only conjecture. The Austrian claim of prisoners in counter-attacks was almost equal to that of the Italians themselves, and it is not impossible that the moral of the whole army was not sufficient to maintaining through a fortnight the attacks which were inaugurated so brilliantly with the taking of Monte Santo and the Bainsizza Plateau. At any rate, in the light of subsequent events, we now know that Cadorna was fighting for far more than the opening of the road to Trieste in that fateful week when he was throwing the flower of his armies in successive waves of attack upon the shell-shattered summit of Monte San Gabriele. Great and masterly though the victory was, it fell short of the sweeping one that was needed to make the more querulous of the malcontents forget the shortage of bread and macaroni. The very heavy losses which the Italians sustained at this time must have had the effect of aggravating rather than relieving the ominous situation on the "internal front."

In travelling—on foot and by motor—many scores of miles behind that very sector of the Upper Isonzo front where the Austro-German offensive first broke through, I passed line after line of the most elaborately built trenches I have ever seen on any front. Mile on mile of those built in the earth were not only walled with concrete, but were also vaulted over, so that they formed veritable stone underground galleries, loop-holed and provided with machine gun emplacements in accordance with the very latest practice. Where they were excavated in solid rock the latter was completely covered over with wire netting in such a way as to minimise the danger from

flying fragments during a bombardment. That a fighting army occupying them could not have held up for many weeks any kind of attack the enemy could possibly have launched is unbelievable. The Italian communiqué, however, supplies the reason of the rapid advance over them when it speaks of the "lack of resistance of some detachments of the Second Army." One can at least be sure that no Alpini or Bersaglieri units figured in those detachments. Indeed, one reads of the heroic efforts of the one to save beleaguered Monte Nero, and of the "sublime bravery" of the other in protecting the retreat of the main army by holding a crucial key position on the Isonzo.

History, for good or ill, is being made rapidly in Italy this week, and for the moment it will profit little to speculate regarding the significance of the events of one day when they may be discounted by those of the next. The great Liberal Majority—the men who brought Italy into the war and who have been principally responsible for her glorious achievements in prosecuting it—may be counted upon to stand firm in the crisis, and it is they, too, upon whom devolves the task of re-awakening in the less "conscious" industrial workers and peasants a sense of duty and responsibility.

The duty of the Allies of Italy is twofold; first and foremost, such military assistance as the situation may call for, and, second, the taking of such measures as are in any way possible to remove the principal causes of civil unrest. Coal and flour in sufficient quantities are the things most needed. The men who make Italy's guns and munitions must not be allowed to go either cold or hungry this winter.

The peoples of the Allied countries in this great, and perhaps supreme, crisis, would do well to think and speak of Italy only as a temporarily stricken Power, and, keeping well in mind the incalculable debt of gratitude they already owe to that gallant nation and its armies, extend to both a full measure of the confidence and sympathy they so richly merit, and so sorely need, in this their hour of trial.

The foregoing article was substituted at the last moment for a description of Italy's Aerial Cableways by the same writer, illustrations of which appear on Page 19.

A Great Skua

After one of the great gales at the end of September Mr. W. J. Polley of High Street, Burford, in Oxfordshire, sent to this office a bird which had been picked up dead in that neighbourhood. Not being able to identify it we submitted it to the Natural History department, the British Museum, which now informs us that the bird is of considerable interest.

"It is an example of a dusky variety of the Great Skua (*Catharacta skua*). It is very rarely inland or on our south and eastern coasts but breeds in the northern islands—that is, Shetlands, so that it is uncommon to find it inland. It is of further interest as it is a dark brown colour instead of chestnut brown. A similar variation is figured in Dressers *Birds of Europe* (Vol. VIII, p. 457)."

The specimen, which was a young bird and in excellent condition, is now in the possession of the British Museum.

Little is heard nowadays about Germany's plans for reconstruction after the war, but the work goes on. The Russo-British News Bureau recently mentioned that "the German is making elaborate plans to conduct his trade in Russia as if nothing had happened. From reliable sources we learn that he has established classes for discharged soldiers to train them as commercial travellers. They are taught the Russian language, Russian history, and Russian methods of business. Moreover, numbers of women, some 40,000 it is said, are being taught Russian so that they may be able to conduct correspondence and replace the greatly depleted ranks of men. Yet another idea that is being worked out, is providing Russian agricultural prisoners with sample machines to take back with them to their villages, with the promise of a commission on any they can sell. It is a clever idea in its way, but it will be futile if the Allies make an effort to counter it. There will be enormous trade with Russia after the war, and now is the time to take the necessary steps to secure it."

The *Frankfurter Zeitung* in an account of the autumn meeting of the German Agricultural Society held the other day states that, after an address by the new Minister of Agriculture, a representative from Breslau, spoke as follows on "German Agriculture Production and Food Supply after the war."

"He stated that owing to the different methods for obtaining nitrates, the subject of manure would be entirely revolutionised and production would be greatly increased by nitrate manure, the supply of which would be quite independent of Chile saltpetre. Meadows would produce two or even three hay crops. The cultivation of several kinds of pulse would be limited, but that of lupines extended. The scarcity of concentrated fodder would lead to a reduction in the stocks of cattle for fattening, to a change in the keeping of milch cows, and pig-rearing would lose in importance. The conditions of labour would be altered, and wages would rise. Foreign casual workers and prisoners of war would be wanting. Native workers would have to be induced to settle, and machines would be used more and more.

Our Right Flank

By H. Collinson Owen (Editor of *The Balkan News*).

THE left flank of the Western front runs down to the sea at Nieuport, where it is held by British troops backed by British sea-power. And—a fact which is, perhaps, not often recognised—the right flank of the Western front is also held by British troops backed up by British sea-power; for the real right flank of the Western front is not on the frontier of Switzerland, nor yet on the Adriatic, but on the Gulf of Orfano, in Eastern Macedonia, where the British trenches run down to the Ægean Sea.

A journey to this part of our long Balkan line would dispel in the mind of anybody who held it the idea that our mis-named "Salonika Force" is grouped in and around the city which is fondly described as the Pearl of the Ægean. The land way to Stavros and so on to the right flank of the Allied line runs along the broad valley which lies beyond the first barrier of high hills that shut in Salonika. This broad valley is for the most part filled in by the two large lakes of Langaza and Besik. Only five or six years ago, when the world generally had barely heard of the existence of Salonika, this valley must have been one of the most primitive and isolated stretches of country in Europe.

Salonika has its cinemas, and electric tramcars, and its *Saloniennes* who follow with great eagerness the latest trend of fashion; but on Lake Langaza, ten miles away across the hills, there are fishing boats which are probably the exact counterparts of boats used two thousand years ago—they could not possibly be more primitive. Here, in this valley, up to four or five years ago, the roaming *comitadji* had it all his own way. An Anglo-Greek with whom I was talking recently said that in Langaza itself—a large picturesque village, where nearly every chimney-pot shelters a stork's nest—he had met a young Greek of less than thirty, who had been leader of a "band" in this neighbourhood, and who claimed sixty Bulgars as his own portion. His special beat was the road out from Salonika up to the valley—now a broad highway lined with Allied camps and innocent of brigands.

Along the valley itself ran the famous Via Ignatia, the old Roman road, starting from near Durazzo on the Albanian coast, which linked up Rome and Constantinople. One can see little or no trace of it now. The road to Stavros is merely an improved track, and where it crosses the beds of water-courses it is non-existent twenty minutes after a fall of rain in the mountains. St. Paul walked along every foot of the valley. The Via Ignatia ran through Salonika itself, along what is now known as the Rue Ignatia, one of the most crowded cosmopolitan, uncomfortable and noisy streets in all the universe.* It climbed over the hills past the twin and beautiful peaks of Hortiach and Kotos which dominate the city, dipped down steeply into the valley, and so on towards Stavros, and along the coast to Constantinople.

Roman civilisation was the last to touch this valley. Since the Romans went, Macedonia has known only one long endless succession of warring tribes, none of whom ever brought with them much beyond the sword and sudden death. And now the British are making war here—one of the very few virile races of Europe which had not already adventured into Macedonia.

For the time being, at any rate, this part of Macedonia behind our lines is perfectly happy and prosperous. We pushed our way through drove after drove of beautiful sleek cattle, very like our Alderney breed but rather bigger. In each one of the occasional villages, swarms of chubby children rushed out at the sound of the car to cheer and shout at the "Johnnies," and all the British here from general to private are plain "Johnnies." Big herds of goats scattered in absurd terror to right and left of the track. Past Lake Besik there is a good deal of cultivation, and everything seemed as placid and as content as could be.

Macedonia is by no means all bare mountains, shimmering with the heat in summer, and icy with the wind of the Vardar in winter. Stavros is as charming and picturesque a spot as any in Europe, with the blue waters of the Gulf of Orfano lapping gently into the bay, and its beautiful green wooded mountains which run down the left finger of the Chalcidice Peninsula to Mount Athos at the end. In a happier or more accessible country, the swelling hills would be dotted with the white villas of the rich, and steam yachts would know its pleasant anchorage. The bathing, as I can vouch, is excellent. There would certainly be a casino, and Monte Carlo would embark on a campaign of intensive rival advertising. But as things

are, Stavros is one of the lost corners of the world. It is on the road to nowhere, the railway having completely outclassed the Via Ignatia; or rather, it would have been on the road to nowhere had not the British, waging a war which has taken them into the most unexpected places, dropped down into this corner also. As it is, Stavros is the beginning of the last stage of the journey to our Right Flank. A few miles further along the coast our trenches run down into the sea, and beyond that the Bulgar and the Boche hold sway.

And having at last arrived at our Right Flank it is perhaps a little difficult to know what to say about it. The military expert would no doubt find a great deal to enlarge upon, but for my part, I saw only the same forbidding mountain barrier which everywhere confronts the British on their long Balkan front—a front which, it is perhaps not generally recognised, is much the same length as the one we hold in France. Our land and sea and air forces were showing activity. A monitor had slipped out into the blue water, and was sending some "heavy stuff" over into the Bulgar territory. An aeroplane droned overhead on some private mission of its own, and one of our batteries was barking spasmodically. But this is the small change of war, and leaves little to be said about it at this time of day. For the rest, one knew that our infantry was keeping its unceasing watch down in the valley there, as it has done for many long months past with very little relief; with tier upon tier of Bulgarian positions rising ahead of them, culminating in the great mass of Pilaf Tepe which is something over 6,000 feet high.

Apparent Deadlock

At a dinner that evening in a pleasant white-washed room, the largest to be found in the deserted Greek village of X, the Brigadier asked, with what I thought a quizzical look in his eye, "Well, what do you think of it?" Unfortunately I had to confess that I had nothing to suggest. The layman can sometimes bring forward startling proposals for the benefit of the expert, but as far as our Right Flank is concerned, he was silent. There was only this to be said—that if we can find no particular comfort in contemplating the Bulgar positions, he can find none in looking at ours. And with this, at least, the Brigadier agreed.

It is a most interesting country this, where the Struma widens out into Lake Tahinos before it reaches the sea. As our car hummed up the long hill road to headquarters, a beautiful prospect of land and sea was unfolded, with the coast stretching towards Kavalla in the east (the richest tobacco region in the world) and the mass of Mount Athos just faintly in view to the south. It is a region with strange and large poisonous insects that bite freely; a region where the heat can be fierce in the summer; where thistles grow to such giant size that they make the most patriotic Scotsman feel strangely humble; and where there is a tiny but awkward visitor known as the sand fly (although he is common to all Macedonia) whose bite produces a very rapid and debilitating fever.

It is a country very rich in archaeological remains, and possibly our presence here during the war will give an impetus to their exploration when the war is over. The site of ancient Amphipolis is in the No Man's Land between our trenches and the Bulgars, and what the ancient Athenians prized and were very sorry to lose at the hands of Philip, the modern Greeks gained through the good fortune of the last Balkan War—and lost when, by Constantine's treachery of 1916, the Bulgars came down through Rupel.

As already indicated, there are more things to fight against than merely the Bulgar. On two successive nights four visitors slept in the "guest chambers" improvised in a tumble-down house near to headquarters. The rooms were as spick and span as British army cleanliness could make them. But the sand fly was not to be denied. All four were liberally bitten by these tiny and irritating pests, which pass serenely through the meshes of a mosquito net. Of the four, three went down with sand-fly fever within a few days. On the way back along the valley my friend and I bathed in Besik Lake, not far from some ancient warm sulphur baths, whose springs bubble up only a few yards from the shore. It was a blazing hot day—one of the hottest we have had out here—but we kept our sun-helmets on in the water and rejoiced in rude health. Three days later my friend was riding his horse somewhere far up the Seres Road, when he incontinently fell off it. "Sand-fly" had claimed him, and he was picked up with a temperature of over 104. It is a little way Macedonia has—to trip you up just when you are feeling that you are proof against anything her climate can do.

*This article had progressed thus far when somebody came into the room to say that "toute la ville brule." Ignatia Street has changed considerably since then.

Joseph Conrad

By Arthur Symons

CONRAD's inexplicable mind has created for itself a secret world to live in, some corner stealthily hidden away from view, among impenetrable forests, on the banks of untravelled rivers. From that corner, like a spider in his web, he throws out tentacles into the darkness; he gathers in his spoils, he collects them like a miser, stripping from them their dreams and visions to decorate his web magnificently. He chooses among them, and sends out into the world shadowy messengers, for the troubling of the peace of man, self-satisfied in his ignorance of the invisible. At the centre of his web sits an elemental sarcasm discussing human affairs with a calm and cynical ferocity; "that particular field whose mission is to jog the memories of men, lest they should forget the meaning of life." Behind that sarcasm crouches some ghastly influence, outside humanity, some powerful devil, invisible, poisonous, irresistible, spawning evil for his delight. They guard this secret corner of the world with mists and delusions, so that very few of those to whom the shadowy messengers have revealed themselves can come nearer than the outer edge of it.

Beyond and below this obscure realm, beyond and below human nature itself, Conrad is seen through the veil of the persons of his drama, living a hidden, exasperated life. And it is by his sympathy with these unpermitted things, the "aggravated witch-dance" in his brain, that Conrad is severed from all material associations, as if stupendously uncivilised, consumed by a continual protest, an insatiable thirst, un-satisfied to be condemned as the mere exercise of a prodigious genius.

Conrad's depth of wisdom must trouble and terrify those who read him for entertainment. There are few secrets in the mind of men or in the pitiless heart of nature that he has not captured and made his plaything. He calls up all the dreams and illusions by which men have been destroyed and saved, and lays them mockingly naked. He is the master of dreams, the interpreter of illusions, the chronicler of memory. He shows the bare side of every virtue, the hidden heroism of every vice or crime. He calls up before him all the injustices that have come to birth out of ignorance and self-love. He shows how failure is success, and success failure, and that the sinner can be saved. His meanest creatures have in them a touch of honour, of honesty, or of heroism; his heroes have always some error, weakness, a mistake, some sin or crime to redeem. And in all this there is no judgment, only an implacable comprehension, as of one outside nature to whom joy and sorrow, right and wrong, savagery and civilization, are equal and indifferent.

Reality, to Conrad, is non-existent; he sees through it into a realm of illusion of the unknown: a world that is comforting and bewildering, filled with ghosts and devils, a world of holy terror. "There was a hot dance of thoughts in his head, a dance of lame, blind, mute thoughts—a whirl of awful cripples." That is how, in one glimpse, he sees through a man's soul. "He was not speaking to me, he was only speaking before me, in a dispute with an invisible personality, antagonistic and inseparable partner of his existence—another possessor of his soul." Always is there some suggestion of a dark region, within and around one; the consciousness that "they made a whole that had features, shades of expression, a complicated aspect that could be remembered by the eye, and something else besides, something invisible, a directing spirit of perdition that dwells within, like a malevolent soul in a detestable body."

"This awful activity of mind" is seen at work on every page, torturing familiar words into strange meanings, clutching at cobwebs, in a continual despair before the unknown. Something must be found, in the most unlikely quarter; a word, a hint, something unsaid but guessed at in a gesture, a change of face. "He turned upon me his eyes suddenly amazed and full of pain, with a bewildered, startled face, as though he had tumbled down from a star." There is a mental crisis in that look: the unknown has suddenly opened.

Memory, that inner voice, stealthy, an inveterate follower; memory, Conrad has found out, is the great secret, the ecstasy and despair which weave the texture of life. *Lord Jim* is the soul's tragedy, ending after a long dim suffusion in clouds, in a great sunset, sudden and final glory. No man lives wholly in his day; every hour of these suspensive days and nights is a part of the past or of the future. Even in a splendid moment, a crisis, like the love scene of Nina and Dain in the woods, there is no forgetfulness.

"In the sublime vanity of her kind she was thinking already of moulding a god out of the clay at her feet... He spoke of his forefathers." *Lord Jim*, as he dies, remembers why he

is letting himself be killed, and in that remembrance tastes heaven. How is it that no one except Conrad has got to this hidden depth, where the soul really lives and dies, where, in an almost perpetual concealment, it works out its plan, its own fate?

A woman once spoke to me in a phrase I have never forgotten, of Conrad's "sullen subjective vision." Sullen is a fine word for the aspect under which he sees land and sea; sullen clouds, a sullen sea. Some of that quality has come to form part of his mind, which is protesting, supremely conscious. He is never indifferent to his people, rarely kind. He sees them for the most part as they reveal themselves in suffering. Now and then he gives them the full price, the glory, but rarely in this life, or for more than a moment. How can those who live in suspense, between memory and foreboding, ever be happy, except for some little permitted while? The world for those who live in it is a damp forest, where savagery and civilisation meet, and in vain try to mingle. Only the sea, out of sight of land, sometimes gives them freedom.

It is strange but true that Conrad's men are more subtly comprehended and more magnificent than his women. There are few men who are seen full length, and many of them are nameless shadows. Aissa and Nina in the earliest books have the fierce charm of the unknown. In *Lord Jim* there is only one glimpse of the painful mystery of a woman's ignorant heart. In *Nostramo* the women are secondary, hardly alive; there is no woman in *The Nigger of the Narcissus*, nor in *Typhoon*, nor in *Youth*. There are some women slightly seen in *Tales of Unrest*, and only one of them, the woman of *The Return*, is actually characterised.

Is there not something of an achievement in this stern rejection of the obvious love-story, the material of almost every novel? Not in a single tale, even when a man dies of regret for a woman, is the woman prominent in the action. Almayer, and not Nina, is the centre of the book named after him. And yet Nina is strange, mysterious, enchanting, as no other woman is to be. Afterwards they are thrust back out of the story; they come and go like spinners of Destiny, unconscious, ignorant, turning idle wheels, like the two women knitting black wool in the waiting-room of the Trading Company's office, "guarding the door of Darkness."

To Conrad there is an unbounded depth in a man's soul; a woman is a definite creature, easily indicated; and in the splendid *To-morrow* (which, turned into a one-act play, bewildered an audience into inattention by the stark immensity of its dramatic power), it is the "hopeful madness of the world" uttered through the voice of an old man "shouting of his trust in an everlasting to-morrow," and not the rapid incident of the man and girl, that contains its meaning.

Now, can we conjecture why a woman has never been the centre of any of these stories? Conrad chooses his tools and his materials; he realises that men are the best materials for his tools. It is only men who can be represented heroically upon the stage of life; who can be seen adventuring doggedly, irresistibly, by sheer will and purpose; it is only given to men to attain a visible glory of achievement. He sees woman as a parasite or an idol, one of the illusions of men. He asks wonderingly how the world can look at them. He shows men fearing them, hating them, captivated, helpless, cruel, conquering. He rarely indicates a great passion between man and woman; his men are passionate after fame, power, success; they embrace the sea in a love-wrestle; they wander down unsounded rivers and succumb to "the spell of the wilderness;" they are gigantic in failure and triumph; they are the children of the mightiness of the earth; but their love is the love of the impossible. What room is there, in this unlimited world, for women? "Oh, she is out of it—completely. They—the women, I mean—are out of it—should be out of it. We must help them to stay in that beautiful world of their own, lest ours gets worse. Oh, she had to be out of it."

II.

Conrad's novels have no plots, and they do not need them. They are a series of studies in temperaments, deduced from slight incidents; studies in emotion, with hardly a rag to hold together the one or two scraps of action out of which they are woven. A spider hanging by one leg to his web, or sitting motionless outside it; that is the image of some of these tales, which are made to terrify, bewilder, and grip you. No plot ever made a thing so vital as *Lord Jim*, where there is no plot; merely episodes, explanations, two or three events only significant for the inner meaning by which they are darkened or illuminated. I would call this invention creation; the evasion of what is needless in the plots of most novels. But Conrad has said, of course, the right thing, in a parenthesis:

"It had that mysterious, almost miraculous, power of producing striking effects by means impossible of detection, which is the last word of the highest art."

Conrad conceals his astonishing invention under many disguises. What has seemed to some to be untidy in construction will be found to be a mere matter of subtlety, a skilful arresting of the attention, a diverting of it by a new interest thrust in sideways. *Lord Jim* is a model of intelligent disarray.

In the strict sense Conrad is not a novelist; he writes by instinct. And his art is unlike the art of every other novelist. For instance, Meredith or Stendhal make great things out of surface material; they give us life through its accidents, one brilliantly, the other with scrupulous care. Conrad uses detail as illustrations of his ideas, as veils of life, not as any essential part of it. The illusion to him is more real than the facts; and when he deals with the low or trivial, with Mr. Verloc's dubious shop in the back street, it is always a symbol.

In the "simple tale" of *The Secret Agent*, which is a story of horror, in our London of to-day, the central motive is the same as that of the other romances: memory as Nemesis. The man comes to his death because he cannot get a visible fear out of his eyes; and the woman kills him because she cannot get

a more terrible, more actual thing, which she has not seen, but which has been thrust into her brain, out of her eyes. "That particular fiend" drives him into a cruel blunder and her into a madness, a murder, a suicide, which combine into one chain, link after link, inevitably.

The whole question depends upon whether the materia horrida surpasses that horror of the soul which is never absent from it; whether the dreadful picture of the woman's hand holding the carving-knife seen reflected on the ceiling by the husband in the last conscious moment before death, is more evident to us than the man's sluggish acquiescence in his crime and the woman's slow intoxication by memory into a crime more direct and perhaps more excusable. It seems, while you are reading it, impossible that the intellect should overcome the pang given to the senses; and yet, on reflection, there is the same mind seen at work, more ruthlessly, more despairingly than ever, turning the soul inside out, in the outwardly "respectable" couple who commit murder, because they "refrained from going to the bottom of facts and motives." Conrad has made a horrible, forgiveable, admirable work of art out of a bright tin can, a befouled shovel, and a stained carving knife.

The Guest Night

By Etienne

THE long-expected news had come, and small groups of officers were discussing it in the smoking-room. The Commander was leaving us. For three years he had been in the ship—longer in fact than any other officer in the mess—and now he was going.

Though hard things had been said about him by his messmates, and though his departure had been openly prayed for by nearly everyone at some time or other, these expressions and sentiments had always been made in the heat of the moment, and are probably commonly said and thought of every Commander there has been, or ever will be, in the service. For by the nature of his position it is impossible for a Commander not to make himself unpopular at times—unless he is a "Popularity Jack," than which there is no more damnable person.

But when the various rumours as to our Commander's departure, which had been floating round the ship, crystallised into naked facts, the ward-room officers of H.M.S. — realised that they were not only about to lose a first-class Commander, but also a very charming messmate. It was unanimously decided that he should be dined by the mess, with all pomp and honour.

The decision once made, the mess committee—otherwise known as "the civic fathers"—went into consultation with the admiral's staff as to which day during the coming week the ship might be moderately certain of being in harbour. The staff at once assumed an air of profound mystery until threatened that they would not be invited to the feast. On receipt of this ultimatum the "Secrecy Brigade" promptly collapsed and confessed that as far as they knew there was nothing much impending, providing the Germans kept quiet.

A date was fixed, and a formal invitation was sent to the guest of the evening. The mess committee then retired to the fleet surgeon's cabin. They were closed in there for over an hour, ostensibly engaged in composing the menu. The gunnery lieutenant, who lived next door, sardonically suggested that they were engaged in sampling cocktails at the expense of the mess. But as the Paymaster explained, when called upon to give reasons as to the continuous visits of the wine stewards to the scene of the committee's labours, "My dear fellow, how could we compose a menu without being inspired?" and "*Dulce est pro bono publico vinum bibere.*" The young doctor, an artist of merit, painted the menu cards with scenes representing famous incidents in the past two years of the ship's life. Such was one entitled, "Scene on the upper deck when M— dropped the whaler in the water."

The First Lieutenant, who is known as the "Impresario," arranged a gala kinema performance, an amusement in which the Commander took much joy, having always been by far the most enthusiastic patron (with the possible exception of the Admiral) of our weekly shows.

The guest night arrived, and, fortunately, H.M.S. — was quietly at anchor. The ship's band, of which we are inordinately proud (it musters twenty-seven members, all amateurs from the lower deck) played "The Roast Beef of Old England," and the feast began its lengthy course. The King's health was drunk with musical honours, and the father of the mess, who had been almost three years with the Commander, made a short speech. The Commander replied, and, these formalities complied with, everyone settled down for the real business of the evening. The first item was the

kinematograph performance, which is always held on the upper deck in a space screened in by awnings and canvas curtains.

Our Engineer-Commander, a man of resource, had rigged up an ingenious arrangement by means of which, should the picture palace prove too cold, we can deflect into it the hot-air exhaust from the engine-room. As the first lieutenant proudly if somewhat coarsely remarked to our assistant-paymaster, "My dear fellow, you only want someone's hand to squeeze and the illusion would be complete; you could imagine yourself in a picture palace ashore." On this particular night the *pièce de résistance* was a drama in three parts called *Satan's Amazon*. We get our films weekly from an agent near our regular base, and they are returned at the end of the week, if the Service permits. In between Parts 1 and 2 of the drama the following telegram received by the First Lieutenant that afternoon was thrown on the screen:—

To Lieutenant —, H.M.S. — Urgent. "Satan's Amazon" must arrive here to-day, Saturday. Contract to show film at — Picturedrome for week beginning Monday, 5th inst.—KINO.

As at the moment *Satan's Amazon* was some 400 miles from her home, in a place where the railway runs not, and as it was Saturday night, the above wire was not without its humour.

During kinema performances the younger members of the mess usually congregate on a life-saving raft at the back of the theatre. This position is known as the threepenny gallery, and the occupants generally keep up a running fire of candid criticism on the various films. In one of the intervals between the films the Captain laughingly told the First Lieutenant that he would be obliged to cancel his licence as manager of the house if the disturbance at the back did not abate. The remark was greeted with loud cheers by the "gallery." Supported by the gunnery lieutenant, the manager announced his intention of clearing the hooligans out of the house. The two "chuckers-out" made a frontal attack on the position, which was easily repulsed. A parley ensued, in which the "gods" agreed to behave themselves if the undesirable characters down below were requested to leave the building. "We may be common people," dramatically shouted the young doctor, "but we are virtuous; look at the people strolling round your promenade, and the Bishop of London was only up here ten days ago!" A cheer went up from the gallery, and the baffled "impresario" returned to his seat in the "promenade." When the kinema was over we adjourned to the ward-room and a sing-song was started.

The famous topical song entitled "Coal in the Sack," and dedicated without special permission to the Commander, was sung and resung. At about 11.30 p.m. it was suggested that a few parlour tricks might not be out of place. I had to leave the mess at five minutes to twelve, as I had the middle watch; but the last impression I received was that of a number of officers endeavouring to balance pokers on the ends of matches, a feat which the "Sub" declared to be quite feasible, and the secret of which he would impart to any gentleman for the very modest price of one whisky and soda.

Next morning breakfast was rather a frosty meal and several people had "livers." At noon we suddenly went to sea and encountered a small gale. By sunset, to all save a few unfortunates, the guest night of the evening before was a memory of the past. To the few it was still a naked living reality.

Will you help to give them shelter?

IF you could see them—caked with Flanders mud, soaked through, tired out—you would understand why the men who bear the brunt of the fighting are anxious for more Y.M.C.A. Huts.

Men are lying out in the "Crater Field" to-day thinking of the warmth, the refreshment,

the homely comfort, the never-failing welcome that will be theirs once they can crawl back out of range of the machine-guns and make their way to the Hut with the Red Triangle on its roof.

Will you help to give them what they want?

£250,000 is urgently needed

Before winter closes down on the Western Front—before the cruel cold comes—now is the time when the carpenter should be at work, putting up those new Huts for which our brothers and sons are asking. 97 are needed for France, 60 for the Home Camps, 28 for Salonika, and 8 for Italy. The demand is urgent.

Will you give one? Think of the deep satisfaction of knowing that a Y.M.C.A. Hut bears your name; that every one of those splendid men who use it will be your guest.

Some day you may be proud to remember that, though you could not share the hardship and the fighting yourself, you did your best to lighten the hardships so bravely borne by the men in the firing line.

A Hut, fully equipped, costs £600, £750, £1,000 or £2,500 according to size. If you cannot give the whole of that sum will you contribute what you can? The men are waiting. The time is short. In a few weeks the first frosts will be here.

Please send your cheque to-day

Life and Letters

By J. C. Squire

Edward Thomas

EDWARD THOMAS, who was killed in France last spring at the age of thirty-nine, wrote a large number of prose books. Even when forced to produce books for money he wrote with distinction and thought for himself; and the best of his English travel books are better than anything of the sort since Jefferies. For nearly twenty years he wrote no verse, but in 1913, he began writing poetry profusely. Only a few of his friends knew that "Edward Eastaway," who appeared in an anthology this year, was he. He was very shy about his verse and had prepared for publication a volume over the same pseudonym. The book has now appeared (Selwyn and Blount, 3s. 6d. net) with his real name on it. It is beyond comparison his best book; and a second volume is to follow it.

Thomas was a tall, quiet, reserved man with melancholy eyes and strong hands, browner than those of professional writers usually are. His poems are like him, they are personal in spirit and substance; they have his quietness, his sadness and his strength. When there is profound emotion behind them, it is characteristically expressed in few words and a slight troubled movement of the verse. The language is simple and direct, with few made phrases, inversions or fine adjectives; it moves slowly and reflectively, attuned to his prevailing mood, which might be called a mood of resignation if that word did not seem to preclude the inexhaustible freshness of his response to the beauty of earth "lovelier than any mysteries." He felt always the pain of death, and change, but that never clouded his faculty for enjoying things; in his ecstasy over the endless miracles of the earth he was sobered by his knowledge of their transience, but he was not one of those dismal people to whom every ephemeral thing is first and foremost an illustration of the power of the abstractions death and change. He loved things for themselves and thought of their beauty more than of their brevity.

His poems are poems of the earth and of one man who looked at it, not knowing how long he would be able to. It is a lonely man who wanders through the book; when he speaks of other people they are memories or else faintly and remotely in the background. His human relations here are, we feel, subsidiary to, less intense and passionate than, his relations with nature. He is primarily a nature poet, and a peculiar and interesting one. The "landscape" of no English poet has been more normally English than his, and few have covered such a range. Most landscape poetry deals with certain special kinds of times and places, dawn, twilight or sunset, mountains, bleak moorlands, ripe cornfields, seas very rough or very blue, summer more than winter, willows more than oaks, strong sunlight or strong moonlight more than the diffused light of an ordinary overclouded day. This is easily explicable. Scenes very definitely coloured, forms obviously decorative, seasons which make a violent appeal to our senses, shapes and shades by their nature and by tradition indissolubly associated with our universal elementary thoughts and states of feeling will inevitably be those most commonly recalled and described. Moreover many writers have their own dominant and habitual preferences from amongst these; the exhilarating dawns of Wordsworth, the bright still sunshine of Keats, the large moons and lamenting beaches of Tennyson come automatically into the mind with the mention of their names. Edward Thomas was unusual in avoiding the usual. Not only did he not go to nature mostly for decoration or for a material setting for his moods, but he did not select, unconsciously or deliberately, his subjects. Except that he avoided large towns and the conventionally romantic, one may fairly say that he was liable to write a poem about anything one might see at any time of day in a walk across the South of England. He was not haunted by the rare unusual things, the one glorious night of a year, the perfect twilight on a lake, the remembered sunset over the marshes, which will haunt most of us. He was moved by and wrote about the things we pass daily and could look at properly if we cared to; he was like one of those simple and charming water-colour painters who will sit down in front of anything, any ditch, haystack or five-barred gate, and get the essential into a sketch. White winter sunlight; rain on wild parsley; hawthorn hanging over a reedy pond with a moorhen swimming across it; spring snow and rooks in the bare trees; a gamekeeper's gibbet; the head-brass of a ploughman's team; peewits at nightfall; hounds streaming over a hedge; a February day, thin sunlight on frozen mud and three carthorses looking over a gate; old labourers going home—

these are the things he wrote about, and many such trifles many times repeated are the English countryside as it is and as it has been. His earth is not merely something brown that goes with the blue at one particular moment or is dark against the sunset at another; it is earth, now dusty, now wet and clogged, which is ploughed and takes its seed and brings forth corn in due season. He is as close to it at one time as at another; the depths of his heart can be sounded by the dint of a hobnail on a path's mud; and he wants no flamboyant sunsets who can find all the beauty and mystery of colour in the curling white and gold and purple fronds of a pile of swedes.

Any of these poems might be quoted: I will take as an example one of the least conspicuous, a poem less musical than many of them and only indirectly revealing his temperament, one that illustrates scarcely any of his qualities save the closeness of his observation and the use he made of the ordinary. It is *The Path*:

Running along a bank, a parapet
That saves from the precipitous wood below
The level road, there is a path. It serves
Children for looking down the long smooth steep,
Between the legs of beech and yew, to where
A fallen tree checks the sight; while men and women
Content themselves with the road and what they see
Over the bank, and what the children tell.
The path, winding like silver, trickles on,
Bordered and even invaded by thinnest moss
That tries to cover roots and crumbling chalk
With gold, olive and emerald, but in vain.
The children wear it. They have flattened the bank
On top, and silvered it between the moss
With the current of their feet, year after year.
But the road is houseless, and leads not to school
To see a child is rare there, and the eye
Has but the road, the wood that overhangs
And undergrows it, and the path that looks
As if it led on to some legendary
Or fancied place where men have wished to go
And stay; till sudden, it ends where the wood ends.

This wood is anywhere and everywhere; we see it continually and take no notice of it; but I think that this poem would mean more than most to an exile in Rhodesia or the Soudan. You get another completely commonplace scene—the country station—in *Adlestrop*:

Yes. I remember Adlestrop—
The name, because one afternoon
Of heat the express-train drew up there
Unwontedly. It was late June.

The steam hissed. Someone cleared his throat,
No one left and no one came
On the bare platform. What I saw
Was Adlestrop—only the name.

And willows, willow-herb and grass,
And meadows sweet and haycocks dry,
No whit less still and lonely fair
Than the high cloudlets in the sky.

And for that minute a blackbird sang
Close by, and round him, mistier,
Farther and farther, all the birds
Of Oxfordshire and Gloucestershire.

And almost more typical still is *Tall Nettles*: the corner in a farmyard, with a rusty harrow and a stone roller overgrown by nettles covered with dust, except after a shower.

Where, here and there, the poet is more intimate and gives direct expression to his feelings, he uniformly reaches his highest level of poetry. The best poem in this book is *The Bridge*; there are others not in this book, such as *Aspens*, where, standing at cross-roads outside a smithy, an inn and a shop he listens to the trees talking of rain, and gives the last word on his prevalent mood:

Whatever wind blows, while they and I have leaves
We cannot other than an aspen be.
That ceaselessly, unreasonably grieves,
Or so men think who like a different tree.

There are one or two poems which touch on the war; the war as a distant and invisible horror subtly troubling the most secluded English fields. The references are brief; his own destiny has made them doubly poignant. But one fancies that dying he may have known that he had left behind him, in the fruits of his recovered youth, work that will make him, a known and living man to at least a few in all succeeding generations of Englishmen.

Books of the Week

- The Lost Naval Papers.** By BERNARD COPPLESTONE. John Murray. 5s. net.

- Under the Hermes.** By RICHARD DEHAN. Heinemann. 6s. net.
- The Red Planet.** By W. J. LOCKE. John Lane. 6s.
- Revolver Shooting in War. A Practical Handbook.** By CAPTAIN CHARLES D. TRACY, the King's Own (Royal Lancaster) Regt. Sifton Praed and Co. 1s. 6d. net.

MR. BERNARD COPPLESTONE, author of *The Lost Naval Papers*, can tell a good story, and also on occasion can be delightfully impudent in dealing with politicians, whose identity he veils thinly. In this volume he recounts the experiences of one Inspector Dawson, of the British secret service, in connection with the well-being of the Grand Fleet during the first two years of the war. There is a spice of actuality about the stories which renders them attractive, and there is, too, enough character sketching about Dawson which renders him a figure to remember. He is both imaginative and unimaginative, a mere policeman and a genius—such a mass of contradictions, in fact, as enables one to see him as a mere man, and not as the ordinary detective of fiction. There is about the book a healthy tang of salt water, although all of Dawson's adventures take place on land or in the docks where battleships do resort.

Some among the many readers of Mr. William J. Locke's work may vote his latest book, *The Red Planet* (John Lane, 6s.) a trifle slow in comparison with earlier works; Mr. Locke has in this instance, written not only a story, but also a study of the war as it affects the provincial community in England—very much in the same way as Wells wrote of Mr. Britling and his little community. Thus those who read for the sake of the story may find that it drags a bit, for there are reflections on the way in which Britain has responded to the calls of the war, reflections put, aptly enough, into the mouth of an officer who was wounded in the South African campaign past the possibility of further service. For the rest, the story itself is of a man who was a coward, and who, knowing his own cowardice, set to work to achieve his own redemption—as far as his past history left that possible. It also tells of a gallant English gentleman or two, and a woman or two who are worth knowing, and, with the artistry that is peculiar to him, the author takes good care that his readers shall know the characters very thoroughly by the time the last page is reached. The oft-quoted long arm of coincidence is strained a bit in order to achieve the ending familiar to Mr. Locke's readers, and one could wish he had made his main character, the disabled major, rather less of a cripple. Nevertheless, *The Red Planet* is a novel that will give pleasure to many, and is a good picture of provincial England as affected by the war.

Mr. G. R. Samways, who sings of the Flying Corps, has already made himself somewhat of a place with aeroplane verse, in which he displays the spirit of the youthful pilot. For instance, this from *The Sergeant*

Who, when the dawn of peace comes round
Will ne'er by anxious friends be found,
Because he's flayed alive, or drowned?
The Sergeant!

will win the sympathy of all "quirks" who know that sergeant so very well. Not that the author is always in caustic mood, for he can also write good stuff of the Kiplingesque type on occasion. "Klaxon," although concerned most with ditties that sailormen will smile over, since they are written by one who has lived what he writes about, also produces verse of fine quality—his "Overdue," is work of unusual merit, and the invocation "To the Scottish Regiments," again is more than mere verse. We hope to hear more of "Klaxon," who has originality of method as well as of theme, and has the power to express what his fellows of the submarine can only think.

It is, in a way, a disappointment to open a book by Richard Dehan and find that it consists of short stories, but in *Under the Hermes* (Heinemann, 6s. net), this author has produced a collection of tales which will not disappoint the reader. The subjects range from study in the British Museum to life among the Eskimos of Greenland, and include a couple of sketches of the French Revolution in which the author shows the skill of the real short story writer, more especially in the sketch of Voltaire at the deathbed of Emilie du Châtelet, and, after, on his way to the court of the King of Prussia.

In these eighteen stories are humour and tragedy, mystery and fine descriptive power, and in each one of them is a touch of the artistry that made *The Dop Doctor* a famous book. More especially will "The Jest," and "How Yamko married fourteen wives," appeal to lovers of folk-lore.

In *A Bolt from the East*, by G. F. Turner (Methuen, 5s. net), there is an attempt to answer the question as to whether life is worth living, and at the end one is forced to the conclusion that the hackneyed answer to the conundrum is still applicable. The hero is an Indian prince, who brings in theosophic theories and the doctrine of reincarnation, attempting to solve the great problems of life off-hand and to claim, not equality with, but definite knowledge of God, or the Prime Cause, or whatever name may be used. How the prince's pride is brought low, and he is made to see himself as a man and no more is told with great skill and not a little wit, and the theories which the author wishes to enunciate are set round a plot which holds the attention of the reader from first page to last—the moral is kept subservient to the novel all the time. Dealing boldly and yet reverentially with spiritual matters, the author has written an exceptionally good novel.

The author of this excellent little book, Captain Tracy, is a recognised authority on his subject. An expert shot himself, he has done invaluable work in training some thousands of officers in the use of the revolver under service conditions. He is, we believe, the pioneer in this branch of instruction, having started the first army school in the subject, and revolutionised its teaching. In the present volume he supplies, in an easily intelligible and compact form, a résumé of the lectures he has given to officers of the British Army and the Overseas Forces. The ideal at which he aims in his teaching is well-expressed in his story of an American cowboy who, being asked by a bystander the secret of his wonderful speed and accuracy in shooting, replied contemptuously, "Guess yer a clurk, ain't yer? Wal, you don't have to aim with your pen every time you write a letter, do you?" In other words, Captain Tracy's methods aim at making the pupils shoot accurately by a habit that becomes second instinct, so that the officer will shoot at an object as easily and with as little error as one points one's finger at it. The book is full of sound hints and is distinguished by the insight of a born teacher into the personal element in training. We commend it as the best introduction to the use of the revolver.

Torpedoed!
AN OFFICER'S TESTIMONY TO
THE SUSTAINING QUALITIES OF
HORLICK'S
MALTED MILK TABLETS

HORLICK'S MALTED MILK COMPANY, Slough, Bucks.

Sirs,—I had occasion the other day to prove the sterling qualities which you claim for your Malted Milk Tablets and I find they are all you make them out to be. I was one of a Battalion of Survivors (there were eleven of us all told) from a ship that was torpedoed by an enemy submarine. We were adrift for 30 hours in an open boat, with nothing but one of your large size Flasks of Malted Milk Tablets to quench our thirst. I am very thankful to be able to say that when we were eventually picked up not one of us was suffering from either hunger or thirst. I shall always in future carry some of these Tablets with me when I go to sea, as I consider them extremely valuable. I have already recommended them to several brother officers. Yours sincerely, — Engr. Sub.-Lt., R.N.R.

P.S.—You are at liberty to make whatever use of this letter you may wish.

SEND THEM TO YOUR NAVAL AND MILITARY FRIENDS
See that the name Horlick's appears on every container.

In Glass Pocket Flasks of all Chemists and Stores, and in Ration tins for H.M. Forces, 1/6 each. If on active service our Ration tins should be sent, and we will forward one of these tins post free to any address on receipt of 1/6. Give full name and address, or name of ship, also give your own name and address when sending remittance to

HORLICK'S MALTED MILK CO., SLOUGH, BUCKS, ENGLAND.

Names and addresses of shops, where the articles mentioned can be obtained, will be forwarded on receipt of a postcard addressed to *Passe-Partout*, LAND & WATER, 5, Chancery Lane, W.C. 2. Any other information will be given on request.

That Travelling Wrapper

Anyone not yet fully set up in the dressing gown way should send for a tiny booklet which, in spite of its very small dimensions, deals remarkably fully with this kind of thing. Dressing gowns at their best are always desirable possessions, but this little booklet is full of all kinds of tempting propositions, and some very novel ideas too!

Those, however, who still, in spite of all travelling disadvantages, from time to time spend a night or two away from their own roof-tree, will be charmed with one of the offers illustrated in this book—a travelling wrapper and bag. Both of them are in silk cascade, a delightful silk fabric which has come into its own since the unprecedented rise in the price of crêpe de chine, and both are bound round with satin ribbon of contrasting colour.

The wrapper is as pretty an affair as can be encountered anywhere. It only has but one fastening, flutes into fascinating folds of material and when packed goes first into the most astonishingly small compass and then into the awaiting bag. A dressing gown conveyed in this way is indeed to all intents and purposes like carrying a satchelful of handkerchiefs, there being really practically not the least difference in the storage capacity required. The price is merely 29s. 6d., and patterns will willingly be forwarded on request, so that everybody can fully gauge the possibilities of the offer.

The Hygienic Bracket

Everybody wanting to economise space and own the handiest possible contrivance at one and the same time, will be delighted with some hygienic brackets. These most compact affairs are fitted with trays, one above the other—three or four as the case may be, and these trays are absolutely detachable. Thus they can be taken out and cleaned at will, always looking spotlessly fresh in consequence.

These brackets are quite ideal for a bathroom, and can very conveniently be fixed by a wash basin in a lavatory, holding as they do a sponge, nailbrush, tooth powder, tooth brush, shaving brush, shaving soap and all kinds of toilet accessories. The satisfaction of having all these things conveniently stored together out of the way is a very real one—and one, moreover, so easily gained that it may very reasonably be indulged in.

The trays are so shaped that they hold the contents without the least fear of their falling off and getting broken or mislaid, and the clever originator is to be congratulated on the whole affair, as an achievement of convenience and cleanliness.

A Notion for Baby

Quite fascinating is the latest idea in travelling equipment for baby. It is a most compact little holdall with a waterproof cover, and is one of the few novelties of the season.

Its inventor must first of all have had a soldier's valise in mind, and from that worked out the basis of this wholly acceptable idea. Laid out absolutely flat this daintiest proposition reveals itself of white muslin and pink or pale blue quilted silk, with certain receptacles for the important items of baby's toilet. Ribbon tucked elastic bands keep both soap and powder box in place and there is room for nearly everything else that can be thought of.

An attractive white muslin cover keeps little garments from being soiled or disarranged, and then the whole thing folds into a neat small roll going into a waterproof cover.

The small handle allows of this being carried easily anywhere; the waterproof cover ensures that it will not get wet, and hey presto! there is baby's luggage, the most complete affair seen for many a long day. At present the idea is too new a one to be very widely known.

PASSE-PARTOUT

People have been writing to the papers lately on the subject of the ill-treatment of horses in the streets. They would have done more good if, on noticing any case of cruelty, they had gone at once to the telephone, rung up Gerrard 5433, and allowed the Royal Society for the Prevention of Cruelty to Animals, 105, Jermyn Street, S.W., to do the rest. This is the only Society which has a staff of inspectors specially trained for the work of preventing cruelty to animals and, on application to the Head Office, the services of an inspector can nearly always be obtained in case of emergency. This humane work cannot be conducted without means, and an appeal is made to the public for further support, so that the Society may keep its staff of inspectors at full strength.

Nestor Cigarettes

Distinguished always for the unvarying quality of the highest-grade Turkish leaf, and perfect manufacture, the 'Nestor' stands first in favor among men of educated taste.

The name 'Nestor' on your Cigarette is the mark of a quality famous all round the world. The Egyptian Government stamp on every box and tin of 'Nestor' is the guarantee mark of the True Egyptian Cigarette.

Nestors are made in Cairo of selected Turkish leaf. For 35 years the choice of those whose judgment counts.

- SOME POPULAR SIZES:
- SURFIDE: 10, 1/-; 20, 2/-; 25, 2/6; 50, 5/-; 100, 9/11
 - EXCELSIOR (MILDER): 10, 10/6; 25, 2/1; 50, 4/-; 100, 8/-
 - LADIES CIGARETTES (GOLD TIP): 'Queen,' 25, 3/5; 100, 13/-
 - 'Setos Amber' (Oriental Perfumed): 10, 1/10; 20, 3/8; 50, 9/-; 100, 17/9

At all High-class Tobacconists and Stores throughout the World you can buy Nestors.

NESTOR GIANACLIS LTD.
CAIRO & LONDON.

On..on! through any weather...

your Military Dexter takes you dry, fit, ready such freedom in a weathercoat you can find in no other only Dexter proofing is guaranteed to resist wet to the very last.

"As British as the Weather . . but Reliable."

Trench Coats from £5 : 5 : 0 Civilian from £3 : 3 : 0
Supplied by Agents Everywhere

Smart Tailored Shirts

THE comfort and economy of these serviceable shirts will be appreciated by those who study correct dress this season.

We hold a wide selection in all the leading smart styles and patterns. There is "something" for every taste. Autumn Catalogue post free.

AN EXAMPLE.

L.W./142. Tailor-cut Shirt, in Japanese silk, well-fitting collar, inset sleeves, patch pocket, link cuffs. Sizes 13 to 15. Price

15/11

ROBINSON & CLEAVER LTD.
The Linen Hall, Regent Street, W.1

THE "WESTFIELD" SOFT SERVICE CAP with or without back curtain.

Fitted with waterproof lining and greaseproof shields,
16/6

The accepted design for both home and active service wear grips the head without pressure, and will neither blow nor fall off.

WEST & SON MILITARY TAILORS,
BREECHES MAKERS,

SPEAK PLAINLY

THE moment is opportune for a great declaration by one or more of the politicians whom the chance of their profession happens to have thrown into power among the Allied countries. It might come, perhaps, with most force from that man who speaks with the greatest authority at this moment, and with the freshest and largest forces at his back—the President of the United States. It might take the form of a united declaration. But at any rate, the moment is ripe for such a political action, and that action would not only be advisable and timely—one might almost say that it is an imperative necessity in this crisis: and one that cannot be delayed.

The gravity of the situation created by the great disaster in Italy increases with every day, and, most unfortunately, public opinion has not fully seized the magnitude of the peril. It may even be doubted whether the Parliamentary statesmen finding themselves suddenly faced with this new call upon their resources, have fully grasped the profound significance of the enemy movements upon the Venetian Plain. It has already been pointed out in these columns that in mere scale the enemy victory upon the Isonzo and beyond is by far the biggest thing that has yet happened in the war. It has involved, in a far shorter time, far greater losses of men and material than did any other action of any belligerent during the three years and more that the war has proceeded. More than this, more than the mere matter of scale, the enemy victory upon the Isonzo has for the first time thoroughly shaken and threatened with dissolution the whole of an Allied Army organisation. It would be an exaggeration, of course, to say that the enemy had achieved a decision. As yet he has not done so. It is unfortunately true to say that he has, for the first time since the Battle of the Marne, produced a military situation such that a decision hangs in the balance.

Now if there is one plain duty before the journalist in a time of national crisis, it is the re-enforcement, so far as words can re-enforce it, of the national soul. The business of the publicist, and of the modern Parliamentary politician too, for that matter, is to confirm and sustain within the limited measure of his capacity, the spirit of the nation. The tendering of advice to the soldiers as to what their disposition should be, is not only unpardonable folly, but constitutes a national danger. The interference with men in command on account of private jealousies and of private intrigues is more detestable still. In such actions, conducted by publicist or statesman, we have forces at work directly opposed to our interests, and directly favouring those of the enemy. It would be lamentable if any such forces were to prevail at the present time. But the other function, plain, wholesome, and clearly imposed upon every writer and every speaker at this moment, needs no apology and no defence. To confirm the national will,

and to keep the national spirit strong there is no necessity to boast—everyone can see that there is no occasion for boasting to-day—there is still less any necessity, as some imagine, or pretend to imagine, for recurrent panic and sensationalism, which its supporters plead to be in some way a spur to action. All that is needed is to put the facts clearly before the public—that should be done throughout the whole course of the war, regularly and frequently—and in exceptional moments as the present, to plead, not for a military policy, which a journalist is quite incompetent to discuss, but for a political policy, especially of the domestic kind, which he is competent to discuss, and which it is his duty to present.

The politicians have not appreciated at all the importance of keeping the public, when it is at war, fully, frequently, and regularly informed. The fact that so much must be hidden has been made a cover for mere slackness in giving information, or what is worse, an occasional violent exaggeration of the favourable features coupled with a hiding away of the unfavourable. It is not too late, even now, for this grave fault upon the part of our politicians to be remedied. It is still possible for opinion to be formed—as much foreign opinion is, and as American opinion certainly is going to be—upon the main features of the war and its progress, the best estimates numbers, material, losses, and so forth. This, we say, is a normal policy of which we stand in great need. But there is also the particular policy that this article is written to advocate, which is that of a solemn pronouncement by the Western Allies that they still intend to save civilisation thoroughly in spite of the very heavy and novel burden just laid upon those who hoped they had nearly accomplished the task. Unless such a pronouncement is made, and made soon, opinion, which is almost overwhelmed by the rapidity of the enemy's advance in Italy, may waver, and may suffer from that confusion which is the gravest of all civilian weakness in time of war.

There is also this advantage to be gained from a public and solemn pronouncement in the name of the Alliance at this moment. It will fix opinion, it will define the boundaries within which we are acting, and it will direct the motive for which such terrible sacrifices have been made. In a word it will anchor the Allies. There is a danger of drift, as there always is in moments of unexpected strain. There is a danger of confused advices and of very dangerous fallacies in public reasoning upon the international affair. All that needs fixing, and a public pronouncement would fix it firmly. In the House of Commons on Tuesday evening, Mr Asquith, referring to his speech at the Guildhall three years ago tomorrow in which he defined the aims for which England entered the war, said: "Unless and until these are attained, there is no hope for the enduring peace of the world." This statement should be now publicly re-asserted in the plainest terms, so that no miscomprehension can exist anywhere.

No matter what the peril, no matter what the increase of burden, no matter what the unexpected severity of this new strain may be, civilisation cannot afford to admit its own defeat. It would be suicide. The decent, humane, immensely fruitful tradition of England and France and of all the West, cannot admit a new code of warfare which is no better than indiscriminate murder, and which, once accepted unpunished as a precedent, would prevent security in the future. Civilisation cannot admit the violation of treaties. Civilisation cannot admit the enslavement as prisoners of war, even of combatants—let alone of civilians, and of women and young girls. Civilisation cannot admit the massacre of hostages. Precisely because our ultimate task appears at this moment more difficult than it has appeared for many months past; precisely because we are met by a new, sudden, and unexpected change—precisely on that account, must we put forward again—and in the plainest and most uncompromising terms—the very full of our demands.

The whole war now depends upon the moral attitude of either side. If we weaken in our attitude our enemies have conquered, and with them the forces that would dissolve Europe. If we meet them with as proud a declaration as we met them before their last success, we shall reduce them, for we have still, on the whole, the larger resources and the stronger faith.

The Tagliamento

By Hilaire Belloc

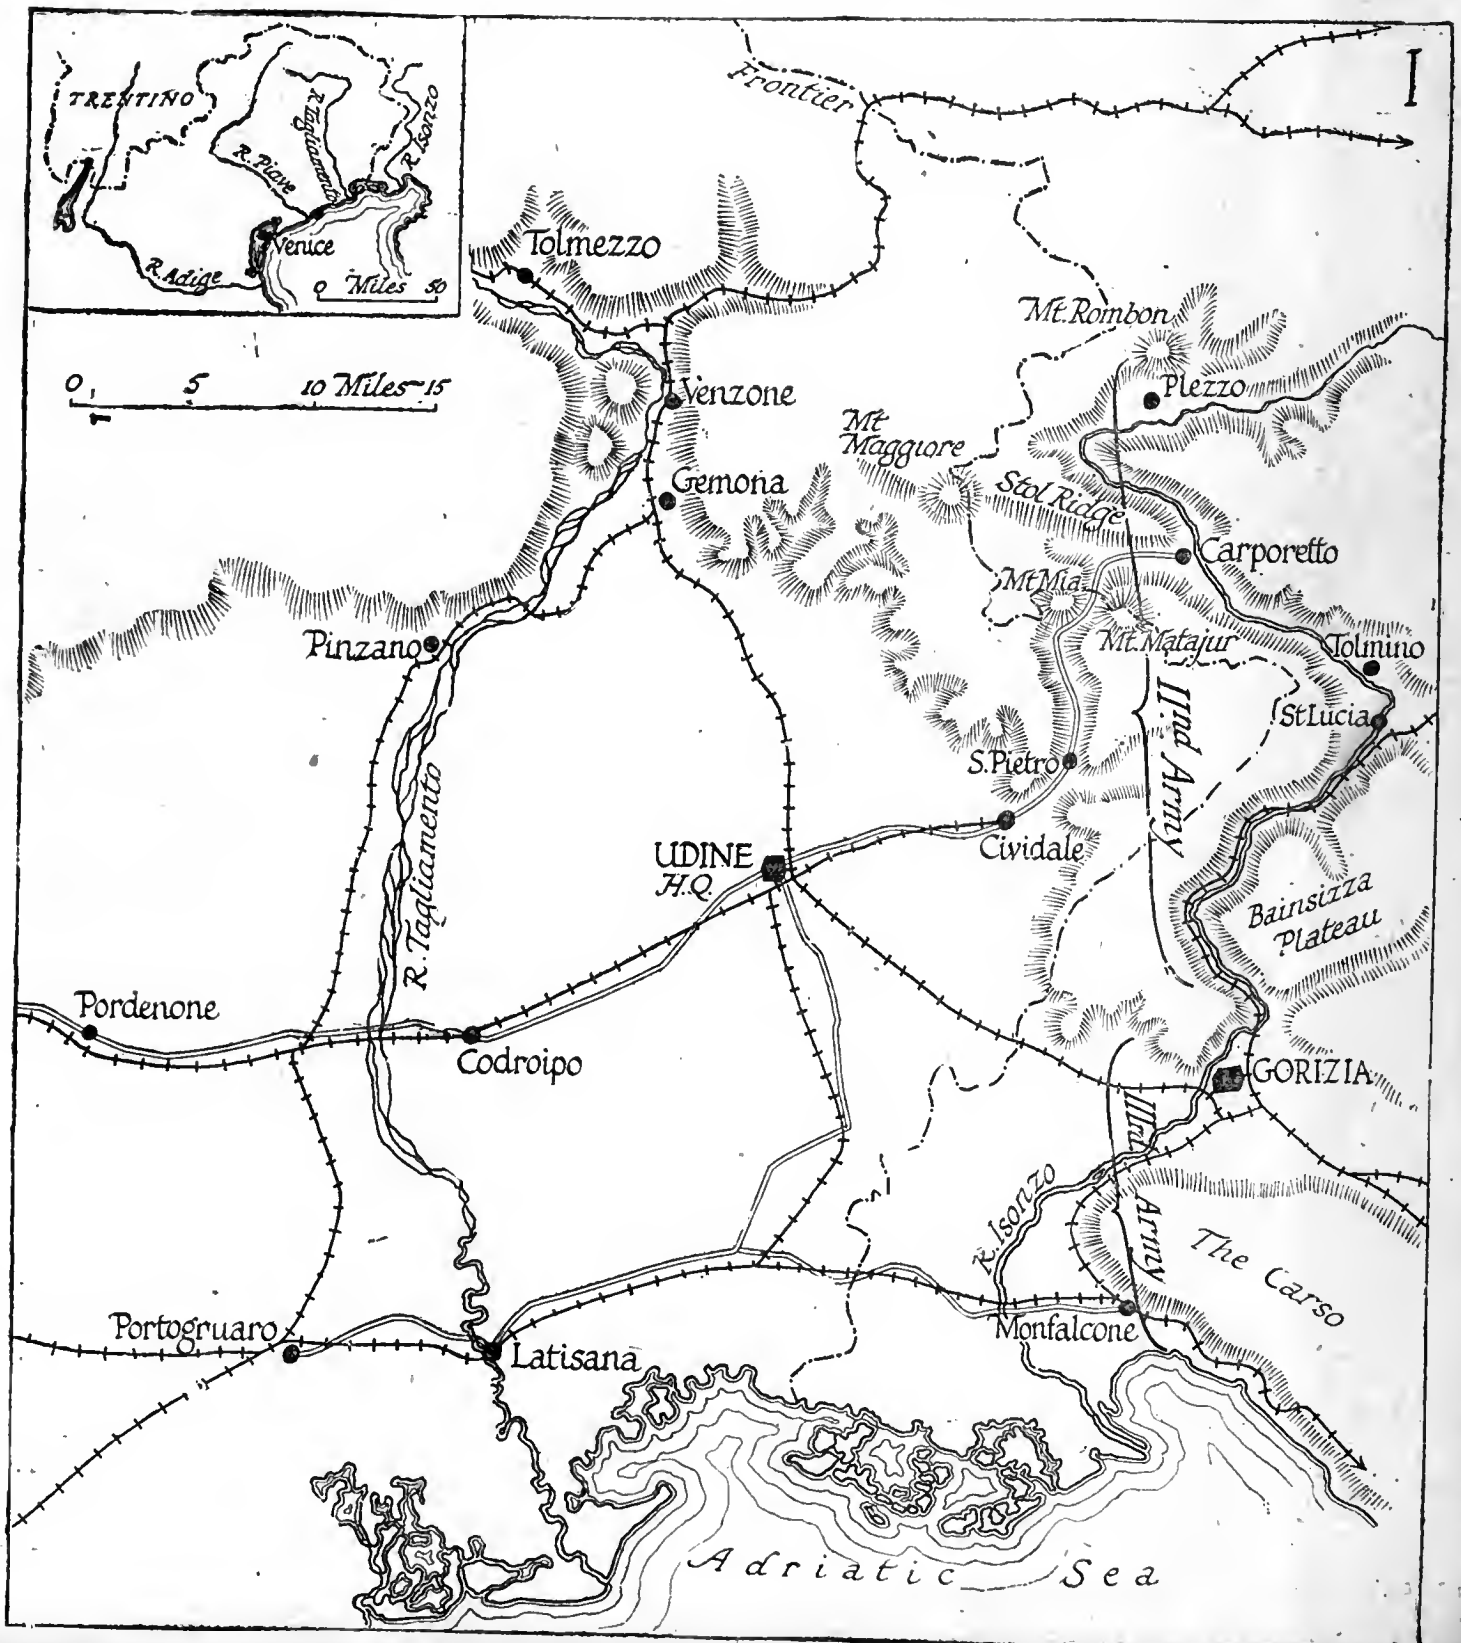

CRUCIALLY important as the Italian situation is, there is very little to say about it in the way of reasonable comment, both because it is still so tragically simple and because the information we have upon it is so meagre. The essential thing for British journalism as a whole at this moment is to insist upon the extreme gravity of the crisis and to make opinion face facts—if indeed that can be done. But this duty can be fulfilled in few sentences. There is no need for piling up rhetoric or for repetition.

As to a retrospect upon what has happened, a fuller description made possible by fuller news with which it would have been interesting to have begun this week's article, we are unfortunately debarred from it by a continued lack of information. Such stories as have come through have hardly any military evidence about them. They are mere descriptions of a hurried retirement and tell us nothing of causes or manœuvres. If we put together all the really military evidence available we get something like this:

The enemy concentrated a certain (unknown) number of extra divisions, a very great (but unknown) number of extra

guns upon the northern part of the Isonzo front, that is in the mountains, against the Second Italian Army, which held the line from North of Gorizia to the neighbourhood of the Predil Pass. These new divisions, some few of which were Germans, but most of which were Austro-Hungarians, were taken mainly from the Russian front or were formed of men taken from the divisions hitherto standing on the Russian front—at any rate the concentration was clearly made possible by the view the enemy now takes of the Russian front. And if this were true of the concentration in men, it is still more true of the concentration in guns—which was decisive.

What that concentration was we simply do not know. The Press for some reason or other first obviously exaggerated it and then as suddenly minimised it. But those who may be too hastily prepared to accept the smaller figures now suggested should remember that we have no real evidence upon the matter. There was no proper identification of enemy forces before the attack began on the Isonzo front—that is quite clear. It is equally clear that the Russian front cannot now any longer send us accurate news of what is happening in and behind the enemy's lines opposing it.

At any rate, whatever was the concentration in men on the Upper Isonzo, there was a great concentration in guns, and these in their turn must mainly have come from the East, where in the enemy's judgment they were no longer needed.

After a very heavy but short preliminary bombardment the attack was launched in the small hours of Wednesday morning, October 24th, three blows being delivered by three picked bodies of two divisions each—exactly assat Verdun. All these six divisions were German. It is perhaps the fact that the spear heads to the attack consisted of these six divisions that has led to the idea that only six extra German divisions were present. The three points of attack were, leading from south to north: (1) That launched from the bridgehead of St. Lucia, just south of Tolmeno, which bridgehead over the river the Austrians had consistently held throughout the recent operations. At this point there is ample supply behind the enemy down the Baca valley, which has an excellent main road and a railway, and a second road coming in from Idria.

(2) The second attack was opposite Caporetto in the very heart of the Isonzo gorge, and was delivered with the object of establishing a bridge there, because Caporetto is the door to the only easy pass through the mountains to the Italian Plain.

(3) The third attack took place at Plezzo also with two divisions, and took place there because Plezzo is the first stop north of Caporetto, where you get elbow room in the shape of a plain down which the mountains recede from the river.

Of these three attacks that from St. Lucia was the decisive one, corresponding to the launching two divisions against Douaumont in the Verdun business. It cut off the second army from the third and at once threatened Caporetto and made the crossing there possible, for the enemy moved northward from St. Lucia up the river bank. The twin attack corresponding to that from St. Lucia was the attack at Plezzo; Caporetto, the third and central point, was but the consequence of the other two. From Plezzo in the north and St. Lucia in the south Caporetto was threatened, and a contemporaneous direct attack on it rushed the mouth of the pass.

The next task of the enemy was to master the heights immediately above the Isonzo to the west, dominating the pass to the plains. The long spur running down the Monte Maggiore called the Stol, and the great mass of the Mattajur are of the same height within 100 feet (that height about 5,000 feet above the river), and stand like guards above the Isonzo and the Caporetto-Cividale Road. They were mastered 28 hours after the first blow had fallen. That is, in the early morning after daybreak of Thursday the 25th, and after that the success was complete. The centre of the Italian second army was thoroughly broken and this centre corresponded to the easy road through the mountains to the Plain, the first town on the edge of which is Cividale.

This sweeping through the Second Army involved immediate retirement of the Third Army to the south. The remnants of the Second Army, the Headquarters Staff, and all its machinery situated at Udine; the Third Army as yet intact between Gorizia and the Sea, fell back upon the line of the Tagliamento.

There are two permanent established avenues of retirement through the Friuli Plain. Each is marked by a great high road; each is marked by a railway, and each has a permanent bridge across the Tagliamento. The first is the avenue from Udine to Pordenone; the second is the avenue from Monfalcone to Portogruaro. For the withdrawal of such an immense number of men, such an exiguity of communications, especially in the matter of bridges, was a great drawback. For between the old front and the Tagliamento (a distance of from 20 to 30 miles, according to the point from which the retreat of each unit began) there are a number of parallel streams cutting the roads and adding to the difficulties of retirement. It is true that apart from these main roads and railways there are a number of country by-roads and that temporary bridges must (one hopes) have been established across the Tagliamento itself and the smaller streams parallel to it to the east. But the main of the wheeled traffic, all the heavy guns, and pretty well all the petrol traffic must have gone by the two roads and the two railways.

The northern or Pordenone road crosses the Tagliamento by the long wooden bridge Napoleon established, and this bridge is called from the name of the nearest village (two or three miles off) the Bridge of Codroipo. To the south of it an equally long railway viaduct leads from one bank to the other of the enormously broad and usually three-quarter dry bed of the Tagliamento. The southern road and railway crosses the Lower Tagliamento at the point of Latisana, a village standing upon the eastern bank.

When the retreat of the Third Army (still intact) began, the advanced bodies of the enemy were at the same distance from the crossings of the Tagliamento as was the main bulk of the Third Army. It was the obvious manoeuvre of the enemy to wheel round southward, that is to the left, and cut off the Third Army if he could, before it had made good its escape by the bridge of Latisana; and for three critical days, during

which we heard not a word from either side upon this essential matter, the thing hung in the balance. It seemed from the map even chances either way. But in the event those chances went, upon the whole, against the enemy. Not that the Third Army got away intact; the last divisions were cut off and it lost a very large proportion of its guns; 60,000 men and no less than 500 pieces fell into the enemy's hands. By the fifth day enough of the remnant of the Second and of the bulk of the Third Armies, formerly constituting the Isonzo front, had got away behind the Tagliamento to re-form a line while reinforcement was coming up from behind, and while the enemy, who had pushed forward advanced units at great speed, was more slowly bringing up his main forces and his heavy material. When the full tale of his captures was announced by the enemy at this close of the first phase in the new Italian business, the figures he gave were 200,000 men and no less than 1,800 guns.

The Tagliamento is, as was pointed out in these columns last week, an insufficient military obstacle. It fills with water only after heavy rains or during the thaws of the snows in the mountains, and all its middle and upper course it is no more than a very broad torrent bed "cut up" (as the name suggests) into a network of tiny shallow rills. It so happened, however, that during the retreat of our Allies there fell for 36 hours continuous and heavy rain and the whole bed of the river was filled with a flooding torrent. We cannot expect it to last long, and the true defence of the Tagliamento line will lie, not in its value as an obstacle, but in the number and quality of the troops which will hold the long prepared trenches upon its eastern bank.

It is clear from the map that the Tagliamento line can easily be turned from the north. But what has not been perhaps sufficiently emphasised is the advantage the enemy here has through his main railway across the Pontebba Pass. If, in the Italian retirement, there was time for a proper destruction of works upon this mountain line, these may take some few days to repair. But we may take it that either immediately or in a short time this railway can amply supply the enemy in the lower foothills of the Alps upon the Upper Tagliamento, that is in the region of Tolmezzo, Venzone and Gemona. Where the valley of the Fella falls into the Tagliamento there is an open space quite large enough for the manoeuvring of considerable troops and a blow struck there successfully, or just on the edge of the foothills where the railway crosses the river, would turn the Tagliamento line. Now if the Tagliamento line is lost—and for an army pressed hard after a heavy blow, it is an insufficient obstacle to defend—there is no really good short and strong natural line to hold till one reaches the Adige—the historic barrier of the Italian plain against the north-east. But the line of the Adige uncovers Venice—and we are in the fourth year of the war. The line of the Piave is in its upper part a mere torrent, and in its whole contour lengthy and unsuitable. Of course trenches can be dug anywhere, but so far as natural obstructions are concerned, the Piave is a bad line.

There is no need to say more. There lies before the Allies, before Western civilisation and its fortunes, a more severe ordeal than any it has yet had to face. To face it the civilian populations of all the Allied nations will need to call upon all their tenacity, and above all upon all their clearness of vision—and the test may be upon us very soon, because there may be restored in the Venetian plain the changing and rapidly decisive factors of a war of movement.

That other military news of the week consists in the slight

German retirement over the Ailette and the capture by the British of Beersheba.

The former event was the natural consequence of the very considerable French success at the end of October. Once the spur of Chavignon was in French hands the northern slope of the Chemin des Dames was enfiladed and untenable to the enemy and they had to give it up. They have gone down into the valley and crossed the stream.

The only accounts of what has happened in Palestine so far to hand are the brief despatches from the British command in that region, and a somewhat ampler description coming two days later from Mr. Massey. General Allenby's report tells us that in the night of Tuesday last, October 30th, a British mixed force advanced against Beersheba from the west and south-west. The infantry striking at the defences of the town from this region, presumably at daybreak, the cavalry moved south of it and then round to the east and the town was occupied in the evening after a determined resistance. General

Allenby tells us the losses were slight and enumerates his captures at 1,800 prisoners and nine guns. The later expanded account informs us that the cavalry work sweeping round to the south and so round to the east of the town, was accomplished by Australians and New Zealanders, while infantry, English in the main, held and then forced the enemy upon the west of the place. The former troops reduced the fortified knoll of Tele es Saba (where the two valleys meet east of Beersheba) by half-past three in the afternoon of Wednesday, the 31st, and during the remaining hours of daylight, further reduced the German machine-gun post on the northern slopes. This done they cut the Hebron Road by which the enemy within the town might have retired, and before nightfall they occupied the heights immediately north of the road and N.E. of Beersheba which dominate the whole of that district. The town was entered in the early hours of that night and the latest reports bring the total of prisoners to more than two and a-half thousand.

The Conditions of Victory—IV

DETAILED discussion of the terms of peace while the enemy yet feels himself unbeaten is the acceptance of defeat. It is clearly a relaxation of effort under a strain. Such discussion when he has just achieved a new and remarkable success is still more obviously the acceptance of defeat at his hands. It is parleying. Even if we knew nothing of the origin of such a demand, we might theoretically determine that it was of enemy origin; in practice we know that it is, both by the moment of its origin and by the nature of its thesis. For the details proposed for discussion invariably take for granted the continued strength of the enemy and his continued possession of all that he is still able to save.

An acceptance of the enemy's demand for this detailed discussion must be avoided as thoroughly as slackness in discipline must be avoided, or as extravagance in conception. It would be playing directly, and for most unconsciously, into the enemy's hands.

In contrast to such a position is a full appreciation by ourselves as to what are the conditions of victory in this awful and decisive business which the Germans deliberately provoked and to which they drove the Austrians in the summer of 1914. We need not delay for a moment upon the presentation of these conditions of victory to an undefeated enemy: For an undefeated enemy could not, for a moment, consider them. It is for ourselves, I repeat, that the study is useful: That we may have our minds clear upon what is the necessary goal of so much effort, and what it is, which if we do not reach, however great the accumulating difficulties may seem, we are lost.

There is here no half-way house as there have been in lesser wars for lesser and often very limited things. The challenge thrown down to Europe, even in the first days of the fight, went to the very roots of national existence. The moment the German spirit began to develop under arms, the fundamental character of the struggle, always clear to those who had watched it coming, became patent by successive examples to the most blind. One after the other all those conventions and sanctities upon which normal European life and the old European civilisation had depended, were violated deliberately upon the initiative of those who, in the very first hours of their projected conquest, had violated the neutrality of Belgium. Nothing but a mental fatigue or a base moral forgetfulness could make men think otherwise of that long descent into chaos which began with the unprecedented ultimatum to Serbia, requiring that country to give up its sovereignty, which proceeded, through the refusal of arbitration and the crossing into Belgian territory, to the massacres and the burning and the shooting of hostages, the looting, and at last the murder of civilian neutrals, and the sinking of hospital ships. The series is not ended yet, nor anything like ended. It is of its nature interminable, and it has not much further to go (if it continues to boast success) for the civilisation of Europe to disappear. No mere scheme of disarmament can wipe out the precedent established if such things go unpunished.

One does not compromise or bargain with a thing of that sort as one might with a dynastic ambition or with a disputed territorial claim. It is clearly life and death on the one side and on the other. It is an issue between an Europe rapidly declining in the future, and declining under the detestable influence of these new doctrines (which cannot create but can only destroy), and an Europe which though terribly weakened, shall yet survive and recover herself. In that issue this country is particularly involved because this country particularly depends upon those conventions and traditions in the relations between civilised communities which

make possible our crowded life upon an island, and the bonds of a sporadic Empire.

That indeed, is the point which Englishmen must, above all men, grasp; that their great polity, crowded with great cities, wholly dependent upon the sea, will be vulnerable as will be no other in a future which should permit indiscriminate massacre from the air and from below the waters.

If these new codes of murder are established, no general disarmament by land, no disbanding of conscript armies, secures this island and its vast inheritance. It is at the mercy of the next threat, or compelled to intensive armament for ever. *And nothing can prevent the establishment of that code save the punishment of its promoters.*

As there is no half-way house or compromise to be considered where such a challenge of life and death has been thrown down (and successfully acted upon) so there is no purpose in discussing the chances of success or failure. It was a vulgar and despicable trick with many to prophesy victory as a certitude. It was a still more vulgar and detestable looseness of the mind which gave way, especially in the early days of the war (but again after the overrunning of Serbia) to shrieking panic. But neither the one attitude or the other is of moment to our subject. *The conditions of victory remain precisely the same whether victory be achieved or no; whether it come to-morrow or after any imaginable delay, or do not come at all; whether it suddenly prove easy or in its last stages prove continuously difficult in the extreme, or prove impossible altogether.* When a man is struggling in a rapid current to reach the bank lest he should drown, no debate of his chances is of the least service. He must put forth his full energy to save himself. No near approach will suffice. He must land or drown; one of the two. And that truth is as obvious to the man who thinks his landing easy as it is to the man who thinks it nearly certain he will drown. The one fatal piece of advice and the only fatal piece one could give to such a man in such a strait, would be to advise him to abandon the struggle in the vain hope that somewhere lower down the stream some chance might save him.

So much being said let us appreciate that there are three considerations attaching to these conditions of victory.

The first is that essential act upon which everything depends: The breaking of the evil will to which we are opposed and which still believes—particularly from its recent successes—that it can save itself unbroken: That will can only be broken by punishments imposed after success against it in the field. You will not break it by asking it to break itself.

The second consideration is that certain material results must be apparent as the consequences of victory, lacking which the name victory would be perfectly empty, for the object of war is peace, and a peace lacking these results would be no peace. Those results have been well summarised by the head, not of the present, but of the last Government, when he put forward the formula: "Restoration, Reparation, and Guarantees." These three words between them cover the ground. The German proposal to conquer and to impose a certain rule upon others must be broken and the material result or evidence of that breaking will be the restoration of what this theory has cost the others; the restoration of that which the would-be conquerors have taken by force from others, without ever consulting even so much as the population involved, let alone Treaty or ancient law. It applies not only to the French provinces from which the conqueror, provoked a vast emigration, and which he later colonised to his advantage, but also to the wantonly annexed

provinces of Denmark and to the destruction of Poland still more wantonly seized by Prussia (and by Austria at the instigation of Prussia) subject for generations to an obscene tyranny, and partially, but thank God imperfectly, planted by their ravisher. That is what restoration means. It means also the emancipation of the Roumanian, the Serb, the Italian populations which have remained unjustly subject to alien force through nothing more responsible than the conventions of politicians. It does *not* mean the evacuation of territory which happens to have been temporarily occupied by the accident of the present war. That has nothing to do with restoration. That is a mere matter of flux and reflux in the movement of military forces in the course of a campaign. It is no more than a momentary and military accident that the lines lie here or there. They may subsequently be withdrawn well within enemy countries and yet the principle be no whit affected. What has got to be restored is the territories of European men taken without right and ruled by alien force: And this restoration is particularly and sacredly necessary where the ravisher has not only stolen the land, but depopulated it and attempted a colonisation of his own.

Besides restoration there must be reparation. He that did the damage must labour to repair the damage; directly by his work, or indirectly by the export of what his work produces, by heavy impoverishment in his power to consume (but not to produce), and the corresponding enrichment of his former victims, he must make good those material damages which alone it is in his power to make good. The moral evil he can never repair. He will pay for that in the attitude which will be adopted towards him by mankind. If those who openly violate admitted law go free under no penalty to restore what they have destroyed, the law loses its sanction and ceases to be of effect. In other words, if we do not achieve the material result of compelling the enemy to reparation, he has won; for he has proved that he can at his will destroy wantonly and suffer no consequences therefrom. The third limb of the formula is the word "Guarantees," and that means hostages in persons, goods or land, or all three combined.

If there is anyone who seriously believes that a mere promise to slave at reparation and to labour without thought of future aggression will be undertaken voluntarily by a Germany not compelled to such justice, he may be left to his opinions, or better still asked to apply them in practice to the civil sphere of his own country, and to expect the sentence of the law without physical power in the State.

The third consideration upon the conditions of victory is the consideration of a particular test by which we may know by a special instance whether victory has been achieved or no.

In the first point, the fundamental one of all, we speak of military decision and the breaking of the evil will to which we are opposed. It is the largest point. In the second we speak of the general external effects of such victory: Restoration, Reparation and Guarantees. The third is a lesser point, but none the less a vital one. We need a test to which any one can turn: A sort of touchstone by which the simplest can discern whether victory has really been achieved or no. That test or touchstone, very unfamiliar to a modern audience in England and possibly unsympathetic to it, is Poland. There will be a Poland after this war. The resurrection of Poland is certain. Equally certainly it will be either a German Poland or a counter-German Poland. Very well, the test is which of the two Polands shall arise. If the Poland that arises after the war is a German Poland, a Poland under the influence of Vienna and Berlin, then the enemy has won. He controls the East. He has erected his "Middle Europe" and is our master in materials and men. The future is his. If, upon the contrary, we can so thoroughly win as to erect a large and strong independent Polish state pressing upon the German borders and making a counter-weight to the German body, cutting it off from the East and denying its monopoly of mineral resources and of the Baltic Sea, we have won. It is the one clear, simple and practical test by which the issue of the war may be judged.

Military Decision

The first of these considerations, though the most important may be dealt with the most briefly. The evil will to which we are opposed must be destroyed, especially in the interests of this country, and it can only be destroyed in the field.

It is a commonplace, but one perpetually forgotten, an obvious truth, but one continually hidden by metaphor and confused speech, that the springs of human action are in something invisible. Those who are so old-fashioned as to dislike the word "soul" may, if they like, use the word "mind." At any rate, it will be conceded that men's actions depend upon emotions and a mood. The architecture, the letters, the morals and manners of a community, the very existence of the community itself, that is of an organisation as distin-

guished from a mere dust of individuals, depends upon this invisible factor. In war what affects this factor is victory or defeat. The instinct of every populace agrees to so simple a proposition; the common sense of all cultivated men supports it, for history invariably supports it too.

It is perfectly true that great changes and often the greatest changes of all have taken place through an action upon the mind with which arms had little to do. The propagation of Islam was an armed thing, but that of the Christian Church in the Roman Empire was not. It can be argued that arms might conceivably never enter into the process and it can be asserted that in some of the greatest examples they were absent. But when the element of a military challenge is present; when one philosophy or religion or national claim just or unjust, has put it to the test of arms, then short of failure in arms the claim makes good or, failing in arms it also fails. To this I think there is no exception in all the known history of the world. It is indeed the weakness of this appealing to arms alone that you risk all from mere material defeat, and upon suffering it will see your ideal destroyed as well as your physical structure. If Islam had conquered in the battlefield half way between Tours and Poitiers in the eighth century, France and Europe would be Mohammedan to-day. It was defeated, and with that military defeat went the beginning of its decline. If Carthage had conquered Rome, the civilisation from which we spring would never have existed. All its ideas, which are to-day the atmosphere we breathe, would be as unfamiliar to us as are to-day the ideas of Baal and Moloch.

The Material Challenge

Now in this present debate the essential point is arms. There was not a conflict between two points of view, each of which was working against the other by persuasion; there was a direct material challenge thrown down by one party to the other in set terms: "We will bring armies against you at our own moment. Our armies are stronger than yours, and will destroy your armies. When we have so destroyed your armies we will impose what terms we choose." That was the German challenge. It was a challenge thrown down under the full certitude of victory (for those who threw it down have never fought odds and have never entertained the idea of fighting odds—it would seem to them mere foolishness, a part of all that chivalric tradition which they call false and despise). It was a challenge concerned with material force alone. If its authors remain undefeated in arms, they have conquered. To think that they have not conquered, simply because their full programme has not been achieved, is to misunderstand the whole nature of the problem. The point is that they felt themselves strong enough to deny the power of civilisation to restrain them. They thought that this impotence to restrain would also involve the fall of the civilisation they attacked. In that they were mistaken. But if they withdraw still undefeated, the core of their original pronouncement remains intact. The plain man puts it in very excellent language when he says: "There is nothing to prevent them beginning again—except fatigue, from which one can always recover." The historical philosopher puts it somewhat differently by saying that "the evil will is unbroken." Both are right. When the barbarian is bought off in any fashion, you are not buying peace, you are buying a truce at usury. You are postponing the evil day at high interest, and all history is there to prove it.

There has appeared during the latter stages of the war, that is, during the stages which are necessarily those of fatigue, an extraordinary doctrine to the effect that defeat is never conclusive. All history is there again to prove the contrary. Defeat, whichever side may suffer it, will produce spiritual fruits of the most vigorous kind. If it be our party which suffers defeat and which accepts the claim of the enemy to violate law and to go unpunished, the sanctity of law in Europe at once loses its force. Progressively and cumulatively the loss of respect for law will proceed, and this will be felt not only in that large field of international relations with which the individual has so little to do, but gradually deeper and deeper down through all the phases of civil and even domestic life.

But there is more than this. The defeated party loses confidence in its own institutions and loses heart, and therefore energy. The thing appears even where your modern industrial man least conceives it possible. It appears in the economic field. The defeated party in a great duel commonly, if history is any guide, declines in material civilisation, goes back and becomes more and more lethargic. In the matter of institutions the defeated party in losing faith loses stability.

Every one of the successful constitutions of modern times, the British, the American, the modern German, has proceeded from a *vo* of victory. It has not been some marvellous balance of their own, some consummate wisdom in their

framers, it has been essentially the prestige of victory which has caused them to flourish. Conversely, if you ask why this or that constitution works ill or is unpopular, why authority consequently dwindles, and why a continued weakness oppresses the State, you will find, though not universally, the roots of the evil to lie in defeat. The standing example of this in Europe to-day is, I think, the French Parliament. True, the system was not chosen by the French and, being an oligarchic system, is very ill suited to their democratic temperament. It is corrupt as all Parliaments are corrupt; it is second rate as all Parliaments are second rate. But if you will read the actual text of the constitution imposed upon the French as an experiment by a small clique after their great defeat of a generation ago, you will find that it contains elements of central power even stronger than those which are the flywheel and guarantee of the American constitution. You will find the safeguards for a full representative character in the French Chamber far stronger in theory and in practice than those which apply to the British House of Commons; you will even find checks for the curbing of the caucus and the professional politicians, such as are wholly lacking in this country and in America hardly to be discovered save in the institution of the Supreme Court. Why, then, do you find in France the Parliament regarded as it is, its membership a subject of contempt, and the whole popular feeling towards it that which one might have towards a disease? I believe that the origin of this misfortune lies in the fact that it arose in defeat.

Even of institutions that do not arise in defeat it is true that when they have suffered defeat they lose moral authority. "A failure in foreign policy" (and there is no such failure like a failure in war) "is the root of all dynastic change." That is a true saying.

This country has been happily ignorant of any such blow

delivered to its fundamental institutions for many generations. It cannot yet conceive of what would follow upon the loss of authority consequent to defeat. But it instinctively feels that a military failure would imperil the domestic life of the nation. And it is right.

There remains beyond these perhaps too general though true conceptions, this highly practical and immediate one: Unless we achieve success in the field nothing of our task can be done. The remainder of what we have to consider, restitution, reparation and guarantees, future securities, all these remain pure vanities and academic talk unless victory be there to impose them. If victory be not achieved or can not be achieved, it is a futility to discuss how much or what the enemy may in his kindness grant, or through his present fatigue temporarily admit.

An undefeated Germany is a victorious Germany. It is a Germany every institution of which will be tenfold stronger than it was before the war. It is a Germany which will be able to say to the world: "We stood up in arms against a universal coalition and defeated it." And to itself: "We failed indeed to achieve an easy victory upon the offensive, but we achieved a stubborn one upon the defensive which has the more thoroughly welded our strength. We have ruined the Russian Empire which we dreaded; we have made all the Central Empires our vassals. We have made all the lesser nations dread us or depend upon us, and the future is ours."

In that future German things from the mechanical to the cruel, from stupidity to impotence; from confusion of thought to its invariable accompaniment, minuteness of detail, would colour the West and with the West ourselves. Those who loved them in the past (and they were many) may be content at the prospect. Those who detested them when they knew them (and they were many, many more) may despair.

H. BELLOC

Sweden and the War

By F. Henriksson, Author of *England in the World's War* (just published in Sweden).

THE political struggle in Sweden, which has now resulted in the formation of a Liberal-Socialist Government, is only a continuation of the political development before the war, but it has been greatly influenced by the experiences of the war. It could truly be said that in no neutral country are the moral and ethical forces behind the war and the displacement of those forces in the course of the terrible conflict so strongly reflected in the internal political development as in Sweden.

Russia's expansive force was for more than a hundred years the principal external factor influencing Swedish policy. It was increasingly so during the present generation when the forcible Russification of Finland, which country was built up by the Swedes, with Swedish laws and customs, seemed immediately to threaten Sweden. The talk of Russian plans for an ice-free Atlantic port, with the possible annexation of Northern Sweden and Northern Norway, excited public opinion. All classes considered it a real danger and it was particularly used by the Militarists in support of their plans for strengthening the country's defences. Revelations of a widespread espionage system in Sweden, conducted by the Russian Military Attaché at Stockholm, the attempted fortification of the Aland Islands, contrary to the guarantee of the Franco-English Treaty, and other events tended in the years immediately before the war to convince Sweden of an immediate menace from the east.

Germany was increasingly looked upon as the only effective barrier against the feared Slav expansion westwards. It is true that England had supported Sweden against the attempt to build what was called a "Gibraltar of the North" on the Aland Islands, which would have been able to command the Swedish capital with its guns. But it was considered that against a military Russian expansion westwards only Germany would be able to give effective military support. Germany had a vital interest, not only to stem the Slav pressure on her own frontier but also to prevent the Scandinavian peninsula from being overpowered by that pressure—that was the trend of Swedish argument.

To this strong political motive for reliance on Germany were added close racial relations, intimate intellectual and personal intercourse, increasing commercial connections and admiration for the peaceful qualities revealed and expressed in the development of modern Germany, the great capacity for organisation, the application of science in all branches of industry and commerce, the system of education and so on. It seemed even to the superficial observer that a system which gave such results must on the face of it be a superior one. That system was the German military system, the rigid

military and bureaucratic organisation, with the subservience of the civilian to the military and the individual to the State. That system appeared to be the foundation and strength of the Germany after 1871. This palpable fact was of course used to the utmost, particularly by the Reactionaries.

Thus the political contest long before the war centred in the conflict of those governing ideas, to which President Wilson so trenchantly has given expression as standing against one another at present. The process in Sweden was the normal one for a country emerging from an agricultural to an industrial state. The Social Democrats, gradually ripening in the school of experience and now corresponding to the English Radicals, with an Extremist group evolving out of them, were in strong ascendancy. In the General Election of September, 1914, they became the largest party in the Lower Chamber. The Liberals, rooted in the old peasant party, were reduced in the pressure between the Social Democrats and the Conservatives.

But in spite of the parliamentary strength of the Parties of the Left the Government remained in the hands of the Conservatives as the Crown used its prerogative for that purpose. The first Liberal Ministry had at the beginning of that year been ousted from power by the Conservatives, using the Crown, evidently willingly, in a forced conflict on the question of increased armaments. The parties of the Left were powerless in face of this use of the prerogative, as the extended franchise was insufficient to ensure against their dominating force in the Lower Chamber being overridden by the Conservative majority in the Upper Chamber.

The first months of the war created a peculiar atmosphere. The Germans had for long time assiduously cultivated their interests in Sweden. It was strongly suspected that they worked hand in hand with certain Swedish military propagandists and nursed Sweden's fear of Russia. German political, technical and scientific literature penetrated Sweden. The German Press was the general source of information for the Swedish Press on foreign affairs. "Wolff's Telegraph Agency," under supervision of the German authorities, had the monopoly of foreign news for Scandinavia. This was deliberately selected and doctored in Berlin before it was passed on to the Scandinavian press, and there were glaring instances of suppressing or editing British intelligence to suit German interests.

And then when the war broke out there burst upon Sweden a veritable torrent of printed, written and spoken propaganda. It came with the same suddenness as the war; it created the inevitable impression of well-prepared machinery, set in motion by the pressure of a button. At that moment the

war presented itself to many Swedes as a preventive-defensive war on the part of Germany. To them, nursed in the shadow of the Russian menace, the Alliance between autocratic and expanding Russia and free, democratic Britain, in desperate commercial competition with Germany in the world's markets, seemed an unholy one and incompatible with professed solicitude for small nations.

Those mentally inclined towards Germany saw in the "encircling of the Central Empires" a conclusive proof of the truth of the case Germany put forward with regard to the real causes of the war. Some of the most prominent German scientists preached their war theses in Sweden, and German editors and deputies came there to organise their propaganda. One of the most energetic amongst them, the now well-known Erzberger, to mention one instance, came and offered exclusive personal war cables, and some leading papers printed his glowing descriptions of the great victories on the west. New German news agencies were created, which flooded the Scandinavian editorial offices with telegraphic matter.

These details are mentioned in order to explain a widely prevailing mood of thought in the first period of the war. Those circles here referred to were mainly to be found in the surroundings of the Court, among the higher bureaucracy and the military. They believed in a short campaign and a crushing German victory. What could England do! was their refrain. The Queen, strong willed, a born princess of Baden and a cousin of the Kaiser, was the rallying point for these forces and she did not hide her light under a bushel. The Crown Prince and the Crown Princess, born Margaret of Connaught, kept a discreet reticence in accordance with their position. They have succeeded in keeping out of the political controversy, thus not compromising their future.

Active Neutrality

Difficulties emerging from the war soon appeared. They mainly centred round trade questions. A characteristic movement greatly disturbed the patriotic harmony. Moved by different causes and a false conception of the origin and innermost meaning of the war, and undoubtedly spurred by strong German influences and German victories, a group of the "young blood," mostly Conservatives, began to preach what they so contradictorily called "active neutrality." Their idea was that the time had come to eliminate the Russian menace by assisting Germany, liberating Finland and freeing the eastern Baltic shores. They advocated openly "courageous lining up at the side of Germany," as the phrase went, and acted in close co-operation with the corresponding "young blood" of Finland. The German Legation in Stockholm was a centre for this co-operation; a large number of Finlanders went to Germany to be trained as soldiers; arrangements for smuggling of arms into Finland were made and valuable information from Russia was constantly obtained through these channels.

The "Activists" were never numerically strong and they were widely ridiculed. But their connections among the governing classes, which held the grip on the State machine, the silent support from ruling circles, their underhand methods with German intrigues and plans for a rising in Finland, which should fire the Swedes, made them at one time dangerous in the sense that by a military or other coup the country might have been faced with a *fait accompli*, involving it in war against the will of the overwhelming majority of the people. The highest danger point was reached when in August, 1915, the German armies penetrated deep into Russia and appeared able to get to Petrograd.

But before that time the Liberals and the Social Democrats, particularly the latter under the strong lead of Mr. Branting, had conceived the danger of a coup, and had awakened public opinion to it. They had challenged the Conservatives and the Government in Parliament to denounce the dangerous activities and received certain assurances. But although the Conservative Party leaders disclaimed connection with the "Activists," they could never be prevailed upon to denounce them or express any decided disapproval of their propaganda; on the contrary, they publicly expressed their esteem of the movement as having ultimately the highest patriotic end in view.

It was laid down as a leading thesis of international law that a neutral country's trade with belligerents was only limited by the belligerents' ability to stop by force the trade in contraband as determined by international law. The belligerents' needs, particularly Germany's, and in a less degree Russia's, gave rise to an enormously profitable trade in the countries situated between the belligerents. The Scandinavian countries were flooded by a swarm of commercial adventurers of a very cosmopolitan character with certain races predominating. A great gamble began. Millions were often earned in a day in commercial speculations by persons who

had no knowledge of commercial transactions. It was the great time of the "goulyash barons"—a general name given to these get-rich-quick-on-the-war people on account of the fortunes made by evading the law in making and sending large quantities of "goulyash" to Germany from Denmark. The proceedings of the English Prize Court have given many interesting details of the methods used by the gamblers to get goods into Germany.

There was of course also a large increase in more legitimate business with commensurate profits in certain industrial and commercial branches, such as shipping, which made considerable fortunes, but those profits generally speaking never penetrated deep into the community. They remained in a comparatively few hands, while the population as a whole very early began to feel the depressing influences of the war in increasing scarcity of foodstuffs and raw materials.

Plockade Measures

Only as the effects of the blockade measures, forced by German lawlessness at sea, began to be felt more and more did the Hammarskjöld government gradually restrict the free reins of commercial enterprise by a series of export prohibitions and conditional licenses, compensation arrangements and other measures. But all those steps were characterised by vagueness and hesitation to interfere with the free play of economic forces. Thus, for instance, the export of agricultural produce, which before the war had its principal market in England, as a consequence soon went altogether to Germany, where the demand was much greater and higher prices were paid. The more far-sighted urged the wisdom of maintaining as far as possible the pre-war export both to England and Germany, even at a loss, the more so as the country had to look to importation from the west of such raw materials as oils, fats and fodder in order to maintain its agricultural production. But it was of no avail. As a result the import of those raw materials was finally practically cut off by England for the reason given that she could not as a belligerent be a party to assisting her enemy by supplying Sweden with oils and fats, for the manufacture of margarine, which released butter for export to Germany. The result was that the butter export ceased of itself and a scarcity of butter and margarine occurred in Sweden.

The Hammarskjöld policy of neutrality became more and more suspect to the Entente Powers, who formed the opinion that it was conducted by a mentality inclined towards Germany if not influenced by Germany for one reason or another. They considered that it was subservient to Germany, indulgently passing over the most brutal manifestation of German warfare, which was hitting even neutrals hard, such as the destruction of neutral ships without warning and murdering of neutral sailors, while it reacted strongly, even by hasty actions, against the Entente blockade measures, which, however considered, must be placed in a very much milder category of warfare. That was also the liberal criticism in Sweden, which found the Premier blinded by legal formalism.

By degrees opposition against the Hammarskjöld policy rose in Sweden as the growing difficulties in getting supplies from the west as result of that policy caused increased shortage of many necessities. The widening opposition extended rapidly to industry and commerce. Great confidence had all the time been put in the Foreign Minister, Wallenberg, whose sympathies and whole character were considered as a safeguard, but events tended to show that he had finally been overruled by a mastering mind. It should be pointed out that Hammarskjöld, the Prime Minister, has not in Sweden been seriously accused of any direct "Pro-German" policy or of intention to deviate from conscious neutrality; he was probably convinced of conducting a purely Swedish and strict neutrality. But effects count more than intentions in a position of such responsibility in a world's crisis. He was gradually accused of taking all the powers of Government in his own hand and of overriding Parliament.

The gathering storm broke out when Parliament met last January. The Social Democrats gave the Government notice that the party-truce was at an end as a consequence of the policy of the Government. Their attacks were violent; they were supported by the Liberals and outside those parties public opinion in the country was now strongly aroused on account of the scarcity in foodstuffs, which had necessitated rationing. The reckless submarine warfare declared by Germany in February altered somewhat the real position as it made a trade agreement with England—a second attempt to make one, for which Swedish delegates had been in London some months, had just failed—of less importance on account of the transport difficulties, but the feeling in Sweden could not be checked. The Hammarskjöld Government had to go.

The King again summoned a Conservative Ministry, with a very capable business man and experienced politician, Swartz, as Premier, and the ex-Premier Lindman as Foreign

Minister. It was undoubtedly a considerable improvement on their predecessors. But the rising tide, influenced by the revolution in Russia and America's entry in the war, was too strong. The Social Democrat leader Branting raised the constitutional question, demanding extension of the franchise to the Upper Chamber, which would break down the domination of the Conservatives there and thus introduce Parliamentary Government. Signs of unrest appeared in many places, mainly on account of the food policy; large masses of people demonstrated threateningly outside the Parliament and the Castle in Stockholm; there was even serious collision between them and the police and military. In several garrisons there were signs of disaffection, and worse things might have happened but for Branting's assurance that order would be maintained if provocative military measures were not taken and the demonstrators justifying the trust Branting had put in them. The new Government, however, refused the demand for constitutional reform, but the Premier referred to the approaching General Election as the best way for the country to decide.

The main points in the Democratic Party's election programme were the demand for franchise extension as a necessary preliminary to the institution of democratic Government, resting on the majority will of the people, and condemnation of the Hammarskjöld trade policy and general conduct of State affairs with its appearance of partiality towards the different groups of belligerents. The extreme section of the Conservatives, those who had been called pronounced "Pro-Germans," and who had supported the "Activists," raised the cry of danger to neutrality, should the Left and particularly Branting and his party get into power, as they would then drag Sweden into the war on the Entente side and submit to its extreme blockade demands.

But the opinions of the electorate were too firmly held to be greatly influenced by these scares. The great bulk of the population had never any real leaning towards Germany. It was only the position within the State machinery of a small section, its aggressive methods and the initial force of the German propaganda and the Russian menace which made it outwardly appear at first as if there was a strong Pro-German opinion in Sweden. Even in the first months of the war there was a bitter social struggle between "Pro-Ententists" and "Pro-Germans." A large portion of the press has con-

stantly worked against German influences, and papers like *Socialdemokraten* have been accused of extreme Pro-Entente leanings.

The result of the elections was never in doubt. The Luxburg revelations added fire to popular resentment, but they did not much influence the voting, as this was already completed in many divisions. It should be emphasised that the English Press has not done justice to the deep indignation in Sweden at the disclosure of German cypher messages being sent through a Swedish Legation. The only real defence was that the practice had grown up gradually and without suspicion from small beginnings, and the Foreign Minister and the Government were by public opinion freed from any knowledge of the real nature and extent the practice had assumed. It was, however, their duty to know, as they were responsible, and in face of this they were further strongly attacked for lacking a clear conception of the gravity and the consequences of the matter, manifested in casuistic explanations, instead of an open and frank statement.

The result of the General Election was: Social Democrats, 86; Liberals, 62; Conservatives, 58; Extreme Socialists, 12; two new Peasant Groups, 12. The state of Parties before the Election was: Conservatives, 86; Social Democrats, 72; Liberals, 57; Extreme Socialists, 15. The Parties of the Left thus obtained a clear majority even in the combined voting of both Chambers, which is necessary for certain important decisions.

As a consequence the Swartz Government resigned, despite attempts from the Reactionaries to inveigle the Crown again into party strife. This Government received the testimony from their opponents that they had done their best to correct the faults of the Hammarskjöld policy, but at the same time it was claimed that the Foreign Minister, Lindman, could not possibly retain a post in which he had been formally responsible for the Luxburg telegrams, which had so seriously compromised Sweden.

The King attempted to form a Coalition Government with the view of maintaining a united front externally and of re-establishing the party truce. The plan received sympathy from all Parties, but it fell through because the Conservatives would not risk their existence as a Party by acceding to the demand for immediate reform of the franchise.

(To be continued.)

The Power of the People

By L. P. Jacks

IN what does the "power of the people" consist and how can we ascertain whether it is on the increase or on the wane?

We might begin with statistics of population and wealth. But these by themselves prove nothing. A community may increase in population and yet become degenerate; it may increase in wealth and become corrupt. As everybody knows the Roman Empire was losing power at the very time when it was increasing in population and in wealth. It will be agreed that we must look for other signs.

Shall we fall back then upon success in war and take that as our test? But this again proves nothing, or nothing to the purpose. To begin with, the "power" to which conquest bears witness is power of a special kind which may co-exist with marked weakness in other directions; and is hardly what we have in mind when the *power of the people* is in question. But waiving that, success in war does not prove that even the special kind of power which war requires is on the increase. It might be that this power was declining in all the nations together, but declining less rapidly in the nation which conquers than in the others. To beat your enemies in war it is not necessary that you should increase in warlike power; it is enough if you decrease less rapidly than they.

Let us try for another test. What shall we say to the extension of the franchise? That people, we might argue, is growing in power which is giving to its members a larger share in the business of government, the greater the number of persons who possess a vote the greater will be the power of the people. This at first sight looks more promising; but unfortunately the promise is damped by further consideration. What looks promising is that the people, all of whom we will assume now possess the vote, have the power to get what they want. What damps the promise is that the people seldom know what they want. Shall we keep Mesopotamia or shall we give it up? Some of us are for the one, some for the other. Shall we establish Home Rule or try something else? Some of us are for the one, some for the other. Consequently the people break into parties or factions, and instead of concentrating their power on a prompt settlement of Ireland or

Mesopotamia, waste it in a war of minds which goes on for a half century and generates so much bad temper that the questions at issue become almost insoluble. Is that a sign of power?

But we are not yet at the end of our tether. Instead of thinking of the questions on which the people seem unable to make up their mind let us turn to those which by one means or another do get themselves settled. Let us judge by accomplished results, by the legislation actually turned out, by the elaboration and the efficiency of the government machinery, of one kind or another, which an enfranchised people sets up for the purpose of defending its house and keeping the inmates in order.

There are the Army and Navy, equipped with all that science and skill can devise. There are the Constitution, the laws, the rules of Parliamentary Procedure, the Courts of Justice, the jails, the police. Behold this vast organisation, and as it develops and extends and imposes its rules on ever widening circles of the normal life may we not say that the people, whose will it represents, is growing in power?

At last, then, we seem to have discovered a sound test by applying which we can ascertain whether the power of the people is increasing or the reverse. The test is organisation, as revealed by the laws enacted and enforced.

But even this test is not infallible. Unless the greatest care is used in its application it may lead to mischievous conclusions, and has in fact done so already to an extent which is alarming. It may give us an inflated notion of the power of the people. And it may blind us to their weakness.

We must ask not merely *how much* organisation there is, but what is its purpose, *what is it for*? Suppose that the greater part consists of laws and rules for compelling people to do what they ought to do for themselves without compulsion—for example, keeping their promises, or providing for their old age, or educating their children, or behaving themselves decently in the streets. Should we not now begin to draw conclusions contrary to those to which our first impressions led us? Should we not say that all this governmental machinery which seems at first sight to speak of nothing but

power is rather the sign of weakness further back? Evidently we should argue, these people are weak in the principle of honour, weak in the sense of parental duty, weak in self respect and intelligence, or they would not require so many laws and so many policemen to compel them to keep their promises, to educate their children, to provide for their old age, and to behave decently in the streets. Suppose some genial philosopher should take us to a chemist's shop and say, "Here are the signs of the health of the people. See how powerfully science is grappling with the ills of the body. An appropriate remedy for every disease! Not one of them without its corresponding bottle of physic! Lethal weapons for the microbe! Death for colic, gout, measles! You are in the very temple of health."

What should we answer to our genial philosopher? "Your argument," we should say, "is a bad one."

Let us try a bolder image still. Suppose we could be introduced in turn to two planets. The first we will imagine to be roaring with "government" of the type or types that now exist on this earth; parliaments in full swing everywhere; laws pouring out from the Senate house like sausages from a Chicago pork-factory; an incorruptible policeman at every street corner; and a good substantial jail to cheer the eye of the traveller at the entrance of every town. Our second planet shall have none of these things. Its inhabitants shall manage their affairs by means of an understanding, such as exists in every well-regulated family, that they are to trust one another for decent behaviour. On which of these two planets should we see the plainest signs of the *power* of the people? I give my vote, without hesitation, for the second.

But all this, it may be said, is not quite fair. Granted that the laws and the courts of justice and the jails and the policemen, and all the other means the people take to keep themselves in order, do suggest what you say—namely that the principle of order must be weak to begin with. But they suggest something else as well, which is, that the people *know* their weakness and are taking the appropriate means to make themselves strong. It is because they recognise the importance of their duties and are resolved to acquire the habit of doing them, that they set up a government and continually increase its scope. The government is a sign of power after all.

Functions of Government

Very good. But now, if this line of reasoning is sound what are we entitled to expect? We are entitled to expect that as time goes on there will be a gradual diminution of the function of government. As the people acquire the habits of order and goodwill which the laws and the police are intended to teach them, the output of law and the number of policemen will steadily decrease. But they don't decrease. They increase by leaps and bounds. Day by day there are more orders to obey and more compulsion to submit to. The habit of spontaneous good behaviour is not being acquired. The habit that *is* being acquired is of a very different kind. It is the habit of relying upon government to effect everything which we might easily effect for ourselves. And my contention is that the growth of that habit measures not the power of the people but its weakness.

So then I am driven to the conclusion that the true test of growth in the power of the people lies not in the amount of government it creates, but in the amount of government it can dispense with; not in the number of laws it enacts, but in the number it can do without. This is my answer to the question with which I set out.

The cry is ever for more government and more laws; and when one pleads, as I am always doing, for less government and fewer laws, and argues that a sovereign people should show its sovereignty by abstaining from the misconduct which renders policemen necessary, there is an inevitable shout of derision: "What! No courts of law! No jails! No lawyers! No elections! No Secretaries of State!" Thus the *Spectator* not long ago, in criticising certain pacifist proposals of a rather foolish nature, had this sentence: "There would certainly be greater waste of money and greater human suffering if we disbanded our police force, pulled down our jails and placed no check on private greed and private passion." Quite true. But my point is that whatever sign of a people's power may be read in the jails and policemen appointed to check its evil passions, there is a sign of greater weakness in the evil passions that need to be so checked.

There is a much shorter cut to the same end than that provided by the jails and policemen, which is, of course, to get rid of the evil passions in the first instance; and that, I contend, is what we should expect a really *powerful* people to do. I suppose most persons would grant so obvious a commonplace. Why then has no sovereign people so far taken this obvious shorter cut? Because we have a wrong notion of sovereignty; because we consistently look to our masters to

do for us what we could do much better for ourselves; because we have fallen so deeply into the habit of trusting to jails and policemen to do the business that we have forgotten how easily the whole business might be done by the exercise of qualities which anybody might acquire.

Dominance of the Policeman

Nothing is more curious in the political thought of our day than the dominance in it of the idea of the policeman. It would scarcely be an exaggeration to say that our ultimate category of political thought is the police. And not of our political thought alone, for the God whom many of us worship But let us keep to politics. The very "pacifists" whom the *Spectator* trounces for wanting to get rid of the police, have oddly enough a scheme of their own on hand for setting up an international police as a means of preventing war. There seems no getting rid of the police obsession—no persuading people, not even pacifists, to take the short cut of common sense instead of the roundabout way of police supervision.

I believe I am as sound a democrat as anybody who may chance to read this article and perhaps disagree with it. But the democracy I believe in is not a system of government. It is a method of learning, by very slow degrees, to do without government. In other words it is a method of education, the final object of which is to develop the true power of the people by throwing them more and more on their own responsibility, by weaning them from the bad habit of trusting to external force thinly disguised under the name of law. I know the immense difficulty and danger of such an ideal and would agree with anybody who deemed it all but hopeless. The bad habit with which one has to contend is so widespread and of such long standing that vast multitudes have lost the power of acting on their own responsibility, so that if, for example, you want to make them sober the only way is by Act of Parliament. So with the other things—such as providing for old age. The reason why many, who could easily do it, fail to provide for their old age is simply that, under the system which has so long prevailed, they have fallen into the habit of waiting to do their duty until the law makes them—like the young men in some of our villages before conscription who, when you told them they ought to join the army, answered, "I shall not go till they fetch me." So conscription had to come, and its coming pointed to a weakness in the community—the weakness of those who would not go until they were fetched. At the same time there were hundreds of thousands of men who did their duty without being compelled; and this suggests to my mind that in regard to many other matters there are vast reserves of voluntary good behaviour in the people which a wise statesmanship should set itself to develop.

"State interference" has not yet entirely killed out this greatest of all our national assets—the power of acting on our own responsibility; so that people like myself have really some ground for looking forward to a far distant time when democracy shall have got rid of "conscription" in countless other forms in which it now exists and flourishes—when we shall all be "volunteers" in regard to the general body of duty which it behoves a decent citizen to observe. Meanwhile so long as men are such idiots that they will not come out of a public-house until they are fetched, we must pay the penalty for the system which has helped them onwards to that state of idiocy, and send a policeman to throw them out, thus making them sober by Act of Parliament—that is, unless they are drunk already.

In a previous article I took as my text the instance of a family who, as a measure of war economy, had got rid of their *servants* and found to their surprise that the thing was not only possible but a great success. In this article I have ventured a bolder flight by suggesting the possibility that we might, with advantage, get rid of our *masters*, or at least reduce them in number. Our masters are the laws and the despots, or the lawyers who make them. I am inclined to think, against the general opinion of my contemporaries, that the second is not more difficult to get rid of than the first. It will be granted that some of us, in the present age, have too many servants. May it not also be true that all of us have too many masters?

The war is giving us a chance such as we never had before, and may never have again, of getting out of our ruts. I suggest that this notion of curing our ills by piling on more legislation and more government is a rut, and a very bad one too, in spite of all that philosophers have said to prove the contrary. What the people want in order to develop their *power*, is less government, less legislation, and always less until at last we reach the Golden Age when there will be none at all. Legislation is *physic*, and society can no more live on legislation than a man can live on Epsom salts and backache pills. Meanwhile the vendors of this *physic* have the market-place to themselves. But many of those gentlemen are quacks.

Harvest and Tillage

By Sir Herbert Matthews

THE great event of the year—the ingathering of the harvest—is now practically an accomplished fact, though a few sad and weather-weary wrecks of what once were crops of corn may still be found in the rainy west; though many thousands of acres of potatoes are still in the ground, and large areas of mangolds have yet to be pitted. Continued wet weather will add to the labour and cost of saving these roots, but they are not likely now to depreciate seriously, even if delayed for a week or two. We can therefore briefly review the position, though it is not yet possible to give any exact figures.

In their report for August the Board of Agriculture said that the month everywhere was wet and windy, but most severe in the south and south-west. Corn was generally lodged, and cutting by machinery much restricted. Continued wet prevented cutting until corn was over-ripe, and a good deal of “shedding” occurred. From most parts sprouting of grain was reported. “None of the corn crops are up to the average but barley is generally the best and oats the poorest. Prospects are worst in the Eastern Counties.”

In their report for September the Board said “September was upon the whole favourable to agriculture in the eastern half of the country; on the western side the weather was more unsettled, and harvest operations were delayed accordingly. Over the greater part of England the corn was secured, generally by the second or third week of the month, in satisfactory condition; but in the west a certain quantity still remained to be carted, and some in Wales had still to be cut, while much was harvested in damp condition.”

A three hundred mile journey in mid-October through some of the chief corn-growing districts, and various inquiries as to threshing results, bear out the correctness of the Board's earlier reports, and we have to realise that in spite of an increased area under cereals the ultimate result must be a decrease in the quantity for sale. The quality, too, is below the average. Barley, though the best crop of the year, has been badly “weathered,” while numerous reports of threshing oats show that, whereas in a normal season a bushel of oats would weigh 40 pounds, this year they will only average 30 to 32 pounds. From the producer's point of view this means a smaller cash return together with a heavier cost in labour than he anticipated; while it involves a need on the consumers' side for greater economy in the use of all kinds of cereal foods. The one crop that has turned up trumps is the potato. In nearly every county these are more than an average crop, which together with the increased acreage gives us something to fall back on. The fear of disease, that at one period threatened disaster, has proved to some extent unfounded, for though it assumed serious dimensions in some counties it did not become general, thanks largely to the spraying which was done in many counties last July.

Turnips, swedes and mangolds are all good, the last especially so, and it is lucky for us that these roots are good, for the damaged condition of a large proportion of our hay and straw, and the very serious shortage of concentrated cattle foods will make it difficult to keep flocks and herds through the winter, and impossible to turn out any quantity of fat meat of the usual quality before next midsummer.

The reduction in output is not confined to the United Kingdom, for owing to the withdrawal of labour from the land in nearly all wheat-producing countries there is a world shortage of wheat, rye and barley, though oats, maize and rice show a small increase over the average. There is also a continual, if spasmodic wastage, through submarine action; and there is such a shortage of shipping that the surplus wheat in Australia cannot be brought here because of the long route involved. If the war were to end suddenly and at once it would not relieve the situation much, if at all; for such an immediate demand for grain will occur from Germany and its satellites, while the present demand from all other European countries will continue, that the present position might even be aggravated. Moreover it is doubtful if any appreciable increase in ship room would be available for carrying food for a considerable period after the cessation of hostilities. Under these circumstances waste of any kind, even if it be only an ounce of bread, whether by the military authorities or by civilians, is a crime against one's fellow-countrymen, and deserves the heaviest possible punishment.

Such being the case it is of paramount importance that the production of all the staple foods should be raised to the highest possible level in 1918, and though the experiences of the farmer in 1917 are not calculated to encourage him, it is up to him to put forth all his energies to help the country to weather the storm. Farmers have to prove their worth during the agricultural campaign of 1918, and if they fail the country

will have none of them hereafter. It is a case of “get on or get out,” notwithstanding the discouragement of 1917. They must give the country a largely increased food production at all costs, even though it means new methods, breaking of precedents, or the jarring of old prejudices. It may even mean in cases loss of money, but within reason the question of whether certain operations mean profit or loss must not be carried to extremes. Our young men are expected to offer themselves for their country, to face death, or to be broken in body or health for the remainder of their lives. Those who are not willing to take the risk are looked upon with contempt. Is the man who stays at home, in comfort and security, because he happens to be over a certain age, to take no risks? Is he to count on a profit for his work, and claim to be a patriot for taking the profit? To risk losses may not be good business, but war itself is not good business.

The Farmer's Profits

Undoubtedly the farmer's profits in 1917 are much less than they might have been, for he experienced a year of most trying climatic conditions; he had unprecedented labour difficulties, and he has been harassed by unwise rules and orders, together with threats of dire penalties, from the Ministry of Food; and by conflicting advice and instructions from this and other Government Departments. This discord of authority has probably been a greater handicap than all the rest put together. It is the handicap which could be removed more easily than any other, but while the theory of Government is merely to create new departments, and to increase not the power, but the numerical strength of the Front Bench, the conflict in and between Departments tends to become more, rather than less, acute.

The Board of Agriculture has done its best; but like the farmer it has been hampered by other Departments, and the energy of its President has been wasted by politicians instead of being concentrated on the work of production. In spite of this, however, Mr. Prothero has earned the gratitude of the country. His speech at Darlington should be a clarion call to producers. He knows their difficulties, and does not ask for impossibilities. He is always ready to advise, and the help his Board can give would be greater if he had not to limit his demands to fit in with other Departments.

Preparations for the harvest of 1918 are in full swing. Climatic conditions are not favourable, though better than this time last year. The late harvest has delayed autumn cultivation, just when it is needed more than usual, for the wet summer has left the stubbles very foul and full of weeds. The motor tractors supplied through the Board of Agriculture have been a great help, for farmers are in many cases short of horses as well as men, and these tractors are not only ploughing and cultivating the land, but they are breaking down prejudice. In a recent article the *Mark Lane Express* says:

The demand for tractors to-day not merely exceeds the supply, but promises to exceed the supply even when the full complement ordered by the Food Production Department for the winter-spring programme is available. As a whole the farming community may be said to have been completely converted by recent experience to belief in the value of the tractor.

The Board of Agriculture recently issued a report* on “Breaking up pasture in England and Wales in the harvest year of 1916-17,” which contains some unanswerable arguments, deserving the widest publicity. Thus:

That the existing arable land may be made to yield more food is admitted, and that in many cases it will yield more is expected; but in view of the urgent necessity of adding to the food supply of the country, a policy which neglected the fertility stored up in our grass lands would clearly be indefensible. We cannot rely on the chance that a favourable season and concentration of available resources on existing tillage land may enable the farmer to produce more food in 1918 than, with all the resources of peace he produced before the war. Again, although it is admitted that modifications in the rotation will enable much more corn to be produced on existing arable land than formerly, we cannot assume that the war will end in 1918; or that our land can retain its condition if we largely reduce the area under clover; or that we can maintain a full milk supply, support through the winter months our valuable flocks and herds, prepare the manure on which successful tillage depends, and keep our soils free from weeds if we largely reduce the area under roots.

This report states that the Department asked a large number of farmers for their experience in breaking up grass land in 1916-17; out of 300 replies received from 55 counties, up to

* This report can be obtained gratis from the Board of Agriculture, 3, St. James's Square, S.W.1.

the time of preparing this report, three out of four report successes, while most of the failures were due to lack of experience in this (to many) novel form of cultivation. This is most encouraging, and should give the necessary stimulus to other farmers who hesitate to take risks. The only limit to breaking more pasture up to, say, two million acres, should be the amount of labour, and the number of horses and implements available.

Certain sections of the Press have for months endeavoured to the best of their ability to vilify the farmer, and to induce a spirit of hostility among consumers towards the producers. It is an absurd policy for either the Press or the official world to advocate at any time, and especially so now that agriculture is the key of the position, because the British farmer is a very difficult team to *drive*. He may be reasoned with, but he will not be forced. No known power can make a man farm in what some official may consider the best way if that way be against the farmer's ideas. He may be compelled "to carry on" like other controlled industries, but it is the personal equation, more in farming than in any other industry, that makes all the difference between success and failure, and if the good will of the cultivator be not called into play the land may be farmed, but the result will be wretched.

Continued newspaper attacks, numerous Orders, wise and unwise, and threats of worse to come, crowned by the absurd

Beef Prices Order of the Ministry of Food, had created a very dangerous spirit which augured badly for the harvest of 1918. The statesmanlike speech by Mr. Prothero at Darlington, backed by Mr. Lloyd George's address to farmers on October 9th, and the revision of the Beef Prices Order, has, however, brought about an entirely different feeling. To-day signs are numerous that farmers are doing their best to respond to the appeal made to them by these two Ministers. A healthy atmosphere has been introduced, and if sane departmental action be continued, agriculturists will continue to respond to the best of their ability.

Farming is a business, not a philanthropic amusement. It has to be even more of a business in the future than it has been in many cases in the past. Some control may always be necessary in order to eliminate the bad farmer or the bad landlord; some control is certainly necessary during the continuance of the war, and this is fully recognised by farmers themselves; but too much interference, or too direct attempts to compel will always result in disappointment.

Two things should be remembered by those who advocate nationalisation of the land and its management by a Government department, as well as by others who believe in Governmental control. You cannot force the personal equation in farming, you can only encourage it; and land cannot be managed from London or by any other centralised authority.

The Tide of Battle

By Centurion *

"The Tide of Battle" is a story of the first battle of Ypres, and it is based on actual incidents.

THE aromatic mist of a late autumn morning wrapped the wood in a woolly shroud, and there was an unmistakable nip in the air. From every twig of beech and pine and chestnut hung beads of moisture which, when they caught the sun as it pierced the mists, sparkled like crystals. Little drops of moisture hung also on the grass of some newly-turned sods of earth close by the turf emplacements, and as the mist cleared one could see that these sods formed a mound some six feet by two. It was the grave of the battery sergeant-major. Some eight hours earlier it had been dug by the gun detachment, in the darkness of the night, while the owls hooted in the wood; and the captain commanding the battery had recited so much of the Burial Service as he could remember, throwing in a few handfuls of earth upon the still form under the blanket when he reached the solemn words of committal. He looked at the grave as he walked to the telephone dug-out, and wondered what further casualties the day had in store for him.

At that moment an orderly came up and handed him a note. He opened it. It was written on a "Messages and Signals" form, in blue pencil.

"A new target," he said to the subaltern. "Miller: I want you to go forward and observe. We're to take on Z— church. The Germans must have been using it as an O.P. since they drove back the 7th Cavalry Brigade yesterday. We haven't got it registered."

He took his map and ivory scale, and worked out the angle of sight from the range and the height of the new target. The gun detachments were already at their stations. The direction was put on the dial-sight. Two men then threw the trail over with the aid of handspikes. As he shouted out the range and angle of sight, No. 1 of each gun repeated his words like a litany; there was a pause as the layer moved the handle of the clinometer-sight till he shouted "set."

"Lyddite," said the Captain. The loader thrust a shell into the breach and closed the wedge.

The captain took out a cigarette, lit it, and waited.

About ten minutes later the telephonist, who had been waiting with his ear at the receiver, spoke.

"Mr. Miller has arrived at the O.P., sir."

"No. 1 gun ready?"

"Ready, sir," said the sergeant.

"Fire."

The loader pulled the lanyard. There was a loud report and a sheet of orange flame.

"One degree more right, sir," said the telephonist, with the receiver still at his ear. The section commander repeated it.

The layer readjusted the dial sight, and the gun was fired again. There was a pause.

"Ten minutes more left, sir" called the telephonist.

"Ten minutes more left," chanted the Section Commander and Number One in succession.

There was another pause. "Hit, sir," said the telephonist. The Captain, having given the order "repeat," mounted a ladder by a haystack and turned his glasses to the south-east. What he saw apparently satisfied him, and he descended the haystack.

The air fluttered, there was a loud thud, a crashing of timber some fifty yards to the left, and out of the living trees rose the mirage-like silhouette of a dead tree outlined in a crayon of coal black smoke above the wood which drifted into nothingness against the sky. No one took any notice. At such times the russet-brown leaves of the beeches overhead trembled violently, and for some minutes afterwards floated down upon the men below till they came to rest on their heads and tunics and there remained. From the direction of the morning sun there came a loud and continuous crackle of musketry, the monotonous tap-tap of machine guns, and occasionally there was a sound like the crack of a whip over the heads of the gunners.

"What d'you make of it, Bovington?" said the Battery Commander.

"It sounds nearer, sir," said the subaltern.

"So I think," said the other pensively. "I don't like it. I'm afraid we're being driven back. The 2nd Welsh and the Queen's are up there. And the German heavies are busy. God! I wish Ordnance rationed us half as liberally."

"Yes, I thought so," he added, as he read another H.Q. message, brought up by an orderly. "We've got to shorten the range again. Give them shrapnel over an arc of ninety. Hullo, wait a minute, sergeant. The wagon limber's on fire. Get some earth and that tarpaulin! Quick!"

They ran to the limber, and the sergeant snatched the loose sods from the newly-covered grass and threw them on the limber, while the gunners plastered it with spadefuls of damp earth. There was a loud pop, then another. Then silence. The Captain inspected the limber-wagon cautiously.

"It's all right" he said to the subaltern with a sigh of relief. "There are only two or three cartridges gone off. If the back of the limber hadn't been forced outwards, the whole box of tricks would have exploded. And we haven't any to spare. I hope the teams are all right. We've already lost a leader and a wheeler of No. 1 gun."

Meanwhile the gun had been swung round again to its former position facing East. The gunners threw off their tunics and rolled up their shirt-sleeves. The gun-layer having moved the sight-elevating gear to adjust the shortened range, gave a twist to the gun-elevating gear till seeing the insect-like crawl of the bubble, he stopped. This done, he commenced to spray the German lines with a hail of shrapnel.

The sun rose higher in the heavens, and the mists cleared. The captain advanced to the edge of the wood some ten yards in front of the guns, keeping well away to the left to avoid the blast of his guns, and with his glasses swept the long road marked by a line of tall fluttering poplars still in leaf. He saw an irregular procession of figures drifting up the road; he noted that all of them limped painfully. Every now and then spurts of brilliant flame would suddenly appear from nowhere in the sky, a white ball of smoke would unfold itself into a scroll shaped like a sculptured dolphin, and one or

* Stories by Centurion appear exclusively in "Land & Water"

two of the limping figures would fall in the road, and lie where they fell. At such times, or rather a moment before, some of the figures would dart for the shelter of the poplars and behind the trunks; it was the slower ones who fell. In the distance, about half a mile away, was a solitary figure moving so slowly that he hardly seemed to move at all, and executing as he went a kind of clog dance, making no attempt to dodge the shells which fell around him. A soldier passed; his right arm hung uselessly down, and the side of his face nearest the captain was plastered with coagulated blood. Stretcher-bearers were nowhere visible. This surprised the captain the less as he knew that every battalion detail who could carry anything was carrying on with a rifle.

As the morning advanced, the omens darkened. The units of the German armies in front of the sunken road that cut the road to Menin at right angles through Gheluvelt were thrusting forward like the fingers of a gigantic outstretched hand, and in the narrow spaces between each pair of fingers each British battalion was being slowly squeezed to death. Such was the picture which presented itself to the Battery Commander's imagination as he pieced together the fragments of intelligence that came in at frequent intervals and were passed along, some formally in a bewildering series of orders, others informally in hurried scraps of conversation that passed like missiles from one mounted officer to another as they met, saluted, and went their ways. That the staff was hard put to it was obvious; cooks left their field-kitchens, A.S.C. men their lorries and were hurried up to the front with rifles to take their places in the firing line. There were no reserves left.

The captain looked at the four guns in their turf emplacements. In the last forty-eight hours he had shortened his fuses from four to two thousand yards; every H.Q. message calling upon him to engage a new target had indicated an objective that was getting nearer and nearer. The guns were now firing over an arc of ninety degrees, sweeping the German front, and the range was little more than a mile. The enemy advance was creeping on like an oil-stain and, if the reports that our centre was being driven in were true, in no long time his gunners would be shot down where they stood and the guns turned on our own infantry in retreat. He ran his eye rapidly over the vital parts of the guns, and as it rested on each part he thought out all the orders he might have to give in the hour of extremity. There were the sights, their brass-work glinting in the sun; with a blow from one of the spades strapped behind the shield he could smash their delicate mechanism. There was the breech-loading wedge, fitting like the back of a watch; it might be possible to dent the edges. At the back of it was the striker plug; if he unscrewed that, he could fire a rifle-bullet into the opening. There was the elevating-gear; a hand-spike through its diminutive wheel would settle that main-spring of the gun for ever. Or he could take out the bolt below the muzzle which secured the piston-rod and fire a last round at high angle in the direction of the enemy and with the gun's recoil the shock would dismount her. But to lay violent hands on the guns that had served him so well was a counsel of despair, and for the moment he put it from him. At all costs he must save them.

As he meditated on these things, he heard a loud droning hum overhead. He looked up between the smooth oval leaves of a beech-tree. A Taube aeroplane was flying over the wood, the black iron crosses clearly marked on its diaphanous wings, and as it passed on it dropped a white fire-ball. He knew what that meant. In no long time the right section of his battery might be knocked out by a direct hit. He rode back to the gun-teams a few hundred yards away to warn them to prepare to go up to the guns at a moment's notice. He found them grouped where he had left them the day before, some of the horses off-saddled and the drivers massaging their backs with the flat of the hand. He ran his eye rapidly over the teams; they mustered the same strength as overnight. If they sustained no more casualties he might hope to get his guns away.

"Get ready to go up and hook in," he said to the drivers.

As he looked at the sleek and well-groomed teams, he felt thankful that he had never let pass an opportunity of impressing on his men the duty of dismounting to ease the girths, of looking after the horse's feet, and all the little arts of horsemastership. He had bidden them remember the horses were their best friends, and that some day they might have to make a heavy draft on that friendship. The day had come.

At that moment there was a rush in the air behind him, and a loud thud. His horse reared on her haunches and then came down on her fore-feet with a plunge that nearly threw him out of the saddle. He could feel her quivering under him in every nerve as he reined her in and patted her neck. He was nearly blinded, but as the coal-black smoke cleared before his eyes he saw one of the horses on her back with her legs lashing the air in agony and her smoking entrails exposed.

She screamed as only a "dumb" animal can scream—a long drawn-out shriek that was like an expiration.

"Drag him out of the way, sergeant, quick, or she'll lash his brains out," he shouted, as she rolled towards her driver. The latter lay quite still, both legs severed below the knee with jets of blood, spurting from the severed arteries. Some of the horses were plunging, and one was bolting madly down the road. The men, dazed by the shock, were holding on to the others.

The captain jumped off his horse, handed the bridle to an orderly, and pulled his revolver out of its holster. With one shot he put the mangled beast out of her futile agonies. He ordered the rest of the team to be withdrawn a few hundred yards to such thicker cover as the wood afforded. But the German guns were searching that wood with inexorable persistency, shivering the chestnut and beech and pine into splinters, and pollarding the poplars as with a gigantic axe. The four teams were now reduced to twenty-four horses, and each gun would have to be brought away with a pair short. He would think himself lucky if he lost no more.

He galloped back to Headquarters for instructions, and as he rode down the long straight road, bordered by a parallel line of poplars which met in a diminishing perspective, he passed more men limping along in every stage of decrepitude, some breathing hard, their faces livid and their uniforms covered with black earth from head to foot as though they had been dipped in pitch. Wounded men with blood streaming down their faces were dodging from tree to tree seeking a wholly imaginary shelter from the shells which with freakish malignity fell here and there as though playing a diabolical game of hide and seek. Three men wearing their equipment and with their rifles at the carry paused irresolutely in the road. An A.P.M. advanced from behind a tree and met them in the middle.

"Hullo! Who are you? Where are you going?"

"We was the Second Welsh, sir," said the spokesman of the party. "We's all that's left of B. Company—we've lost touch with the Borderers on our left flank and the line's broken in. We was looking for some one to post us, sir."

The A.P.M. shepherded them together at the side of the road for despatch to the collecting station.

Other stragglers came up. They were from the 1st Queen's, and they brought news of an overwhelming enemy attack on their right and a murderous enfilading fire.

The A.P.M. fell them in with the rest to send up in support. The debris of other units came straggling in, Welsh Fusiliers, Queen's, a man of the Black Watch, and it struck the captain whimsically as he reined in to gather information that this show was strangely like a cotillon d'Albert in the sergeants' mess with everybody changing partners. Only there was no "sitting out."

Looking down the road which ran straight as an arrow between the poplars, he perceived about fifty yards away the same figure which had arrested his attention half an hour before. How it had escaped the hail of shrapnel was a mystery. It had taken that half hour to cover barely half a mile. He saw now that it was a Highlander without cap or equipment or rifle, a short man with the thick knees, powerful deltoid muscles, thin lips and high cheek-bones, so characteristic of his kind. There was something about his gait which was at once ludicrous and pathetic. The upper part of his body was rigid, but the lower part described a semi-circular movement as though it were a pivot and his agitated legs prouctted on the balls of his feet so that he seemed to hesitate between a shuffle and a dance. But it was a melancholy dance in which the dancer's legs seemed to move of themselves, and in their convulsive movements he betrayed neither interest nor volition. His arms hung at his sides curiously immobile, but the hands twitched ceaselessly, turning on his wrists as on a hinge. The corners of his mouth also twitched and his eyelids perpetually rose and fell.

The Brigadier, who had spent the night in a dug-out by the side of the road, caught sight of him. All the morning he had moved to and fro in the open receiving reports and issuing orders, while smoking a cigarette with unstudied nonchalance. Now and again he found time to speak to the stragglers, rounding them up with words of encouragement. It is not often that a General plays the part of "battle police," but the General knew that in this vital hour every man was worth his weight in gold—also that every man had earned, and should receive, a General's commendation. He took the man gently by the arm. "What unit are you my lad? The 2nd Gordons?" The man blinked at him and made a resolute effort to speak.

"I d-d-d-d-dinna k-k-k-ken, sir" he said, jerking out the syllables as though he were jumping a terrific obstacle.

"Who's your company commander?"

"I d-d-d-d-dinna k-k-k-ken, sir."

"Well, what's your name, my lad?"

"I c-c-c-canna." And tears came into his eyes.

The General led him gently to the side of the road, and made him sit down. He sat there, and a man of the 2nd Welsh handed him a "woodbine." He took it and put it uncertainly between his lips. Then he struck a match. He tried to apply it to the cigarette, but the match danced in his hand like a will-o'-the-wisp, and went out. He struck another, but the distance between the match and the cigarette was insurmountable, and he dropped it.

"Shell shock. I've seen cases like it before" said the General laconically. "C Company of the Gordons had a devil of a time on Thursday, and he's one of the relics of it." And with a word to the A.P.M. to get the stricken man to the chateau in the wood he turned to his brigade-major. The captain looked after the man, following his quivering movements with a strange fascination. He had seen his gunners blown to pieces by his side, and the horses of his teams frightfully mangled, but to this day the remembrance of that convulsive figure remains with him as a symbol of the hell in which the infantry fought and died.

"He was blown up" said a survivor of the 1st Welsh Fusiliers, whose face was pitted with the blue marks that betray the collier. "By a coal box. My butt was buried by one, and all his section. I was dig him out, but he was dead. And his face was swell up like the fire-damp. There's swelled up it was!"

"Aye," said a man of the 1st Queen's, as though dismissing a platitude. "I tell you what, mate, this isn't war."

"Ho! I don't think" said his neighbour. "What is it, then? We've been outflanked and enfiladed on both sides; outflanked we have. All our officers is gone, and there aren't seventy of us have got back. If that ain't war, what is it?"

"It's b—— murder," said the other.

No one seemed inclined to dispute this proposition. The little group was not talkative. The nervous jocularity which precedes action, the almost sub-conscious profanity which carries men through it, the riotous gaiety which follows after it—all these were absent. They were worn out with want of sleep, parched with thirst, stunned with concussion, and their speech was thick and slow like that of a drunken man. But the Welshman, with the volubility of his race, talked on, no one heeding him.

"But we was give Fritz hell, boys. They come on like a football crowd—a bloke couldn't miss them, even if he was only just off the square. And they fire from the hip! But *Duw awyl!* they're eight to one in machine guns, and their coal-boxes is something cruel. I heard their chaps singing last night—singing splendid, look you—like the Rhondda Male Voice Choir it was. But we give them a funeral to-day, yes, indeed."

"Fall in" said an N.C.O. whom the A.P.M. had impounded. "Fr-r-om the left, number!" They numbered off from one to twenty. "Four paces to the right ex-tend! One to ten right half section. Eleven to twenty left half section! Right turn. Sections right wheel. Quick march!" And he marched them off to a farm in the wood. The captain looked after them for a moment. They were going back into the hell from which they came, and they knew it. But they betrayed no more consciousness of this than if they had been marching back into billets. The captain remembered that the Welsh Fusiliers had *Nec aspera terrent* for their motto and that "Albuera" was blazoned on their colours. "It's the same breed" he said to himself reflectively. While he waited the Brigade-Major returned from the telephone with his instructions from Divisional H.Q. He was to withdraw both sections of his battery to D—— without delay. He galloped back, followed by the trumpeter, and putting his horse at the ditch, leaped it and tore up through a clearing. A branch overhead whipped his cap off and just shaved his head as he ducked; he dashed on. He drew rein by the teams and was relieved to find there had been no more casualties.

"We are going to retire" he said, curtly. "Take the teams up at once and hook in." And leaving the orderly to bring them up, he rode on to the guns and gave his orders to the section commanders. One gun was in action, firing shrapnel at short range; the others were already being dug out, in readiness for limbering up. He stepped forward to the edge of the wood where it broke away into ploughed land and looked over his left shoulder in the direction of the northwest. A battalion was coming up in gun "groups," moving steadily forward under a hail of shrapnel and thinning as it went. It was obvious that they were going to hurl themselves into the breach. It was the last throw of the die and the fate of Europe hung upon it. He did not know at the time the name of the unit; he was to learn afterwards that it was the 2nd Worcesters. He left the section commander in charge of his guns, and rode back along the lane to the cross roads. He found a Field Battery Commander looking down the road with his glasses, and right in the centre of it an eighteen pounder was in position, with the gun-layer on the left of the gun, the loader behind her, and her nonchalant subaltern

smoking a cigarette under the enemy's shrapnel. It seemed a miracle that he was not hit, and the captain stopped in mild astonishment to ask the battery commander what the gun was doing there.

"Doing?" said the latter laconically. "Firing. We've got word that the Germans have driven in the Welsh and are coming down that road in mass formation. Well, we're ready for them. That's all. What a target, eh?" And putting his glasses back in their case, he rubbed his hands as though he were having the time of his life. Which he was.

The captain crossed the road and turned down a lane, and in a few minutes had returned to his battery. The guns were dug out, the teams brought up to the left of the carriages, the rings were slipped on the poles, and the gunners fastened the wheel-traces.

Shells were crashing through the wood, bursting all round the battery, but the drivers sat motionless on their horses.

"Walk! March!" said the battery commander.

The drivers eased the reins and closing their legs each to his riding horse, they rested their whips across the neck of each off-horse. There was a "hwit! hwit!" overhead and a shower of broken leaves and crackling twigs. The rattle of musketry was strangely near and there seemed to be voices in the wood. There was another crack and No. 1 leader of the team fell like a stone bringing her driver down with her. He was up in an instant and stooping over the dead horse he unhooked the "quick release" and mounted the off horse. The captain looked back over his shoulder as he eased the reins of his horse. At that moment he sighted something over the top of the hedge, and he rose in his stirrups. He saw at a glance a number of spiked helmets and heard the push of bodies through the bracken.

"Gallop!" he shouted. And then the blow fell. Something seemed to snap in his head and he felt himself soaring up and up into space, as though propelled by some tremendous force.

Then the pace gradually slackened, the impenetrable blackness was stabbed with points of light, he saw the face of one he loved, and he wondered whether he was in this world or the next. Objects suddenly became distinct, trees took shape before his eyes, he was conscious of his own body, and tried to move. But he seemed to be held in a vice. In his agony he dug his heels into the soil, and he saw that his right arm was gone. A face was bending over him. It was the shoeing-smith.

"Are you alive, sir?"

He turned his head. "Am I alive?" he asked himself. "I—I think so" he gasped. "But my number's up. Leave me!"

Some one got a stretcher and they took him through the undergrowth to the cross-roads. There a doctor injected morphia into his arm and they took him to the dressing-station at Hooze. He was in the trance of morphia, but could hear the doctors, apparently a long way off, saying that he was a bad case. At Ypres they put him under chloroform, and he knew no more till he woke at Boulogne.

His case was grave. He had lost a great deal of blood, and his wounds were septic. Rest, mental as well as physical, was vital; but he could not rest. The exhortations of the doctor were lost upon him: he seemed to have something on his mind. He was allowed no newspapers on the ground that they might excite him, which was a mistake. A box of cigarettes by his bedside he left untouched. At length he called the doctor to him.

"Look here, doctor, will you do me a favour? Well, I want you to find out what's become of my battery. Did they get the guns away? I want to know; I want an official answer."

The doctor promised to do what he could. The Divisional H.Q., who had their hands full, were somewhat annoyed when they got a telephone message from a Base Hospital, asking for information about a battery. But they gave it.

The doctor returned.

"Your battery's all right. All your guns are in action at Z——."

"Thank you, doctor," said the captain, and they lit his first cigarette.

From that hour he began to mend. Three years have passed; the captain still lives, but he is a cripple for life. His fighting days are done; he will never give the word "Action Front!" again. The battery itself is but a memory; near the grave of the sergeant-major lie a subaltern, gunners, drivers and the horses whom they loved so wisely and so well. Their graves have long ago been pounded into dust by guns of whose calibre they never dreamed; old things are passed away and all things have become new; the very wood in which they fell has long since disappeared from off the face of the earth. But these mortals in dying put on immortality, being dead they live; being silent they speak, and leaving behind them an imperishable memory they need no memorial.

Life and Letters

By J. C. Squire

On the Road

JUST before the war there was a large output of books about travel in England, particularly travel on the open road. The authors usually had quotations from Stevenson on the fly-leaves, or Borrow's observation about the wind on the heath, or some contemporary poet's table of affinities with the various elements and heavenly bodies. Publishers commissioned these books with what seemed to them sufficient reason. *Lavengro* was in many cheap editions; Hazlett's *On Going a Journey* was the most popular of his essays; people who had enjoyed Stevenson's *Travels with a Donkey* and *An Inland Voyage*, must surely want more of the same sort; and this above all ages was a self-consciously open-air age. Rucksacks had a steady sale, every country inn knew the walking tourist, and optimists had even started magazines for the amateur tramp. Nevertheless, one doubts whether there was much demand for most of the tramping books. In the first place, the publishers showed an inadequate power of discriminating between travels With a Donkey and travels By a Donkey. In the second place, men, even intelligent men, usually do this sort of thing badly.

* * * * *

The ordinary author of a pedestrian—or, indeed of any—travel book, is weighed down by tradition. He has several famous books behind him, and he is dominated by them. This man gave facts in a businesslike way; so he will give some. This man was delightful with digressions and anecdotes; so he will be the same. This third man, when overcome by the beauty of nature and the exhilaration of freedom and movement, wrote pages of beautiful, iridescent prose, which are well known in all the best families, so it is obviously the game to do this. The result is a most unsatisfactory compost, full of every sort of affectation and posing. It was impossible to discover what these travellers' interests really were, and what really moved them, for they were wearing other people's hearts upon their sleeves all the time, and they felt under a compulsion to prove that they knew how worthy their England was of Great Prose.

* * * * *

These memories were stirred by Mr. J. J. Hissey's *The Road and the Inn* (Macmillan, 10s. net), which I have just been reading. It is the first book of English travel I have encountered since the war. Pedestrianism, I should imagine, is, for the time being, off. For one thing, most of the hearty walkers are otherwise engaged. For another, walking through England must have been stripped of most of its charms, when at every inn you have to fill up forms about the colour of your wife's hair, and every policeman is liable to demand the production of a variety of tickets; and the wayfarer runs the major risk of straying on to forbidden ground and getting a sentry's bayonet brandished in his face, and the minor one of having a crowd of children shouting "Bolo" after him whenever his knapsack and soft hat appear in a village street. Mr. Hissey avoided most of these discomforts by being over age and travelling in a motor car. "A sudden attack of wander-fever had taken hold of me," he says, and without a moment's delay he got out the Rolls-Royce or the Ford (he doesn't bother to say which), and off he went. It sounds like rush, but it is not. "I am," he says, "a contemplative motorist, given to loitering in pleasant places." The suggestion is that he crawled about as though every road were lined with Schools on both sides; and he certainly seems to have seen a great deal, and talked to everyone he met. He records many amusing things; and gives many illustrations. Some of them are drawings made by himself; the lonely haunted grange, Tudor and timbered, being his favourite subject. They are not masterpieces, but they are better than most of us could do. And his excuse and explanation may be found in *The Path to Rome*, the best book of this kind of our time:

In old times a man that drew ill drew not at all. He did well. Then either there were no pictures in his book, or (if there were any) they were done by some other man that loved him not a groat and would not have walked half-a-mile to see him hanged. But now it is so easy for a man to scratch down what he sees and put it in his book that any fool may do it and be none the worse—many others shall follow. This is the first. Before you blame too much, consider the alternative. Shall a man march through Europe dragging an artist on a cord? God forbid! Shall an artist write a book? Why, no, the remedy is worse than the disease.

But having made it, I hope, clear that there is more enter-

tainment in Mr. Hissey's book than in most (he records conversations amusingly, and has an evident passion for old buildings), I would suggest that it exhibits strikingly the flagrant defects of all this class of literature.

* * * * *

He thinks it his duty to be enthusiastic about everything old that he sees; he digresses into unoriginal reflections, to the detriment of his story; he continually buttresses his descriptions of Storied Fane and Castled Keep, and what not, with quotations from the world's worst poets; and, above all, he will insist, when the occasion seems to demand it, upon being literary. He slaps on purple patches with a lavishness only made tolerable by its naiveté, and he will drag in the names of authors. Take, for instance, the sprawling progress and grotesque anticlimax of this:

From the tangle of lanes I got on to a fair road that led me in a few miles to castle-crowned Lewes, then, passing through that ancient town of many memories, I came to Offham, from which village, high up on the inside of the hills, the land dips suddenly down, affording a wide view over the wooded Weald, glorious in its green and golden breadth seen in the soft sunshine. A world of woods and fields stretching away to a far off, misty distance, dotted with here a grey church tower and there a rambling old farmstead, the green expanse being enlivened by the silvery Ouse, near at hand, winding its slothful course snake-like through the plain as though wishful to linger rather than to hasten on its way to the all-absorbing sea, for at times Nature almost seems to be a living presence—at least to Wordsworth she so appeared.

A still stranger example of the ill-advised introduction of great names occurs when the author, proving that the world can show "noting so eminently peace-bestowing, so benevolent as the quiet pastoral English landscape":

even that rugged philosopher Carlyle, once, when in rare bending mood, and not discoursing of great affairs, declared his delight in the simple sight of green fields. Byron, also, averred they possessed a charm that makes one forget all about show scenery in the shape of volcanoes, snowclad peaks, precipices, vines, oranges and glaciers.

It is, perhaps, a little unjust to Mr. Hissey to pillory him at his worst, for he is not, in a general way, pretentious, and his gusto is very charming. But the defects of his method are typical of all sorts of travellers.

* * * * *

There are several ways of writing good books about England. A man may set out with the deliberate object of finding out or forming theories about, or describing a certain class of things in which he is particularly interested, as did Cobbett. To do this well he will have to have an interest, as well as common-sense, knowledge and a simple straightforward manner of expressing himself. He may write a guide-book in which he gives succinctly an account of "everything worthy of note." If he sees things through his own eyes, and describes them naturally, he will make a good book; for as Defoe said in his own fine *Travels in England*, "I find so much left to speak of, and so many things to say in every part of England that my journey cannot be barred of intelligence, which way soever I turn; no, though I were to oblige myself to say nothing of anything that had been spoken of before." And the third kind is the subjective, fantastic, poetic, kind. That kind, the rarest and most difficult, should be put clean out of mind by the ordinary traveller. Fascinating digressions can only be written by the man who cannot help digressing. The worst way of writing is to sit down before something commonly admitted to be noble or beautiful, and determine to rise to the occasion. And a man's emotional experiences are not worth his talking about unless he knows precisely what they are, is primarily interested in relating them, and has the unusual gift of candour. Most people are quite capable of noticing what happens to themselves; we do not want to hear what they think they would have felt had they been some great author; and, if it is not natural to them to write resounding and picturesque English, for Heaven's sake let them write their books in the prose they employ when writing to their friends. And above all, let them not be continually quoting or reminding us what Shakespeare or Charlotte Brontë said about something. Tennyson, complaining of modern critics, said that it was impossible for a poet to say "the sea roars" without being accused of having cribbed it from Homer. That is no worse than taking one by the arm when one is looking at a field, and telling one that Carlyle, in a rare moment of relaxation, noticed that the grass was green.

For Officers on Active Service

A Much-Appreciated Xmas Gift

—and not expensive.

ONE of the chief anxieties of Officers on Active Service abroad, particularly those in the more distant Theatres of War, is to keep themselves in touch with Home News and with the happenings on the various Fronts. Their interest in Home Affairs and in the Progress of the War is sharpened by the very fact that they are so far removed from the heart of things—London.

To them The Times Weekly Edition comes as an unspeakable boon. It contains just what they want. Printed in clear type; of a size convenient for holding and folding, and packed from cover to cover with news of every kind, and with the cream of The Times' Leaders and Special Articles

The Times Weekly Edition

keeps its readers abreast of the War, abreast of Home and Foreign Intelligence, Politics,

Finance, and Commerce; in short, it presents in a most readable form

A Bird's-eye View of the World's History for the Week.

The services of The Times Supply Agency are at the disposal of every reader of The Times Weekly Edition. By personal service, this Agency enables Overseas readers to purchase from the British market as advantageously as though living in London.

ETHEL M. DELL'S

NEW VOLUME OF LITTLE NOVELS

THE SAFETY CURTAIN

AND OTHER STORIES. 6s.

"The Safety Curtain," the longest story in this collection, is a complete short novel of 105 pages. "The Eleventh Hour" is another long story of about 100 pages. Three other stories are included in the volume, making a full-length book of 336 pages.

All of the stories have that vivid interest which has made Miss Dell one of the most popular of living novelists.

OTHER NOTABLE NOVELS.

THE DISCREET ADVENTURE.

By HELEN C. ROBERTS, Author of "Old Brent's Daughter." Cloth, 6s.

"This is a book which one not only enjoys all through, but which leaves the pleasantest recollections behind it after it is finished."—*Outlook*.

"We can thoroughly recommend 'The Discreet Adventure' . . . Miss Roberts has a real dramatic faculty, and she makes every one of her characters distinct to the reader."—*British Weekly*.

ENCHANTMENT. By E. TEMPLE THURSTON.

6s. (3rd Imp.)

MR. TEDDY. By E. F. BENSON. 6s. (3rd Imp.)

THE PUPPET (THE FIRST NOVEL LIBRARY.)

By JANE HARDING. 6s.

MERELY PLAYERS. By LUCY DALE and

G. M. FAULDING, Authors of "Time's Wallet," etc. 6s.

THE CHRISTMAS NUMBER OF LAND & WATER

to be Published in December,
will contain, among other notable features

A New Poem by

RUDYARD KIPLING

Complete Short Stories by

"CENTURION" and JAN GORDON.

Special Articles by

HILAIRE BELLOC, L. P. JACKS,
and G. K. CHESTERTON.

The Revival in Poetry, by

J. C. SQUIRE

AND

An 8 page Supplement in Colours
containing some remarkable Pictures,

By Capt. SPENCER PRYSE, M.C.

ORDER A COPY IN ADVANCE.

PRICE ONE SHILLING & SIXPENCE.

The Major "Takes Over"

There is probably no officer, however confident of himself, who does not find the task of taking over a new company something of an ordeal; a very trying ordeal, too, in many cases.

It is then that he has to summon up his reserves of mental and moral force, for he is, strictly speaking, "on test." If he muffs things it may take him weeks or months to obliterate the bad impression created; and his consciousness of this fact does not help him any.

We have just received a letter from a major with the B.E.F. which gives point to these remarks, and, what is more valuable, shows how this particular officer took over his new responsibilities without a hitch. Writing from France, he says:—

I have seen the value of the Pelman System since taking over my new company. Confronted with a mass of new faces and new names, and with a different system of interior working, I have had a golden opportunity to test the value of your training, and I know that without it I should never have gathered up the threads of things as I have done.

— — —, Major.

Once again we have striking proof that Army officers are not studying "Pelmanism" just for the fun of the thing, but simply and solely because it has proved itself so convincingly a potent aid to efficiency and promotion. Testimony to that effect is voluminous. The Pelman Institute possess several thousands of letters from military and naval officers, each giving expression to unfeigned admiration for a system which is so directly and unfailingly resultful.

So strong is the belief in Pelmanism amongst the higher command that there are numerous instances where generals have recommended their staff to enrol for a Pelman course; just as, in the commercial world, a far-seeing firm sometimes pays for the enrolment of six or a dozen of its employees.

Nor is this confidence misplaced. Pelmanism is all that is claimed for it—sensational although those claims may occasionally appear. The truth is that the facts themselves are sensational; they even exceed the published statements. For example, the Pelman Institute, in speaking of financial benefits resulting from the course, limits itself to examples where incomes of business or professional men have been doubled or trebled. That seems handsome enough; yet this substantial figure has frequently been surpassed. *We know of at least one case where a sixfold increase of income resulted from a Pelman training!*

There are many readers of LAND & WATER—both civilians and officers—who are students of the Pelman system, and these know from personal experience the absolute accuracy of *Truth's* pronouncement: "The Pelman system places the means of progress within the reach of everybody."

The Course presents no obstacle to study—even for the busiest professional man. It takes up very little time—and every minute spent upon it is profitably spent. Equally, it can be practised anywhere—nearly 10,000 officers and men, including 36 Generals and 6 Admirals, are following it in the trenches in France and aboard the Grand Fleet. All correspondence is necessarily confidential.

Every reader of LAND & WATER should at least investigate this fascinating subject and its possibilities. An explanatory brochure, entitled *Mind and Memory*, containing a synopsis and full explanation of the Pelman System, together with a copy of *Truth's* sensational report on the work of the Pelman Institute, will be sent, *gratis and post free*, upon application to The Pelman Institute, 39 Wenham House, Bloomsbury Street, London, W.C.1.

Books of the Week

- A Roumanian Diary, 1915, 1916, 1917. By LADY KENNARD. Illustrated. Heinemann. 5s. net.
 Real Russians. By SONIA E. HOWE. Illustrated. Sampson, Low and Co. 6s. net.
 Inside Constantinople during the Dardanelles Expedition. A Diplomatist's Diary, illustrated. By LEWIS EINSTEIN. John Murray. 6s. net.
 Nine Tales. By HUGH DE SELINCOURT. With an Introduction by Harold Child. (Nisbet, 5s.)

PERUSAL of *A Roumanian Diary*, by Lady Kennard, and of *Real Russians*, by Sonia E. Howe, reveals a multitude of similarities and also a mass of differences between the two writers and their work. Lady Kennard was an Englishwoman who saw Roumania in the months immediately preceding and during the country's share in the war, and her diary carries up to May of 1917; Mme. Howe, a Russian, went to Russia before the Revolution to plead for the liberation of political exiles, and met Stürmer and other notables of the last days of the Empire—in the one case an Englishwoman writes her impressions of a foreign people, and in the other a Russian tells of her own land under the shadow of war.

* * * * *

There is the root difference: yet these two diaries are similar, in that they both portray national characteristics—deal with the background against which the great drama is being played, more than with the drama itself. The stolidity of the Roumanian peasant, the heroism of Roumania as a whole and the awakening of the country to the work that war involves, could not have been better shown by a Roumanian than in this picturesque and yet concise narrative of Lady Kennard's. Similarly, only close knowledge of Russia, and actual sight of Russia gripped by the war, could have inspired Mme. Howe's pictures of neglected soldiery, unexampled devotion, corruption and carelessness, implicit faith and almost unbelievable capacity for treachery—the muddle that was pre-revolutionary Russia. Lady Kennard's is the finer narrative, but Mme. Howe has got nearer to the heart of things—she tells more, and writes more from the inside.

* * * * *

A third war diary, *Inside Constantinople*, by Lewis Einstein, may well be linked up with these two. The author, a member of the American Embassy in the Turkish capital during the Gallipoli campaign, was only enabled to publish his diary through the American entry to the war—it is a pity that his story could not have been made public during the progress of the Dardanelles campaign, for many of the observations that he makes would have been valuable. Value remains, apart from literary interest, in his authentic record of the Armenian massacres, and in the—also authentic—paragraph in which he adduces proof that Germany decided on war immediately after the Serajevo assassinations, determined to break the peace of Europe in the hope of complete conquest.

* * * * *

Although Mr. Hugh de Selincourt has a following of readers, yet his work is of such an order that it is caviare to the great majority, and it is doubtful if any of the contents of his latest book, *Nine Tales* (Nisbet, 5s. net), would find a place in the magazine that usually forms a refuge for an author's short stories. Hugh de Selincourt is concerned in picturing life as it is; not with the sordid attention to detail that is often called realism, but with consciousness that it is a patchwork business, containing happiness as well as grief and ugliness, and in these nine tales, greatly varying in subject and quality, he displays the patchwork for such as have time to read and eyes to see. The first story, "The Sacrifice," is almost a novel in itself, and it is a striking commentary on the war from the woman's point of view; again, in "The Passionate Time-Server," there is revealed so much of the motives of a man as to make the reader know the man intimately, and, knowing, to forgive him. These are but two instances of the nine; in them all is the quality which, for want of a more comprehensive title, may be called the humanity of the writer.

* * * * *

The Ignoble Warrior is the title given to "a collection of facts for the study of the origin and conduct of the war," prepared in English and Japanese and published in Japan by Maruzen and Co., Ltd. Mr. J. W. Robertson Scott is responsible for this volume; and he rendered good service to humanity by its publication; for it places in a readily available form a convincing though, alas, not yet complete record of German lies, dishonour, treachery, and barbarity. It was well that the people of our Far-Eastern Ally should be instructed in the Teuton character. We should like to see the book published also in this country, it might be most useful later on. It is illustrated with Raemaekers' cartoons and contains reproductions of certain German letters, etc.

The Invasion of Italy

Bridge over the Tagliamento

Caporetto

It was at Caporetto that the German-Austrian Armies first broke the Italian Line. The above photograph gives an excellent idea of the nature of the country where the fighting took place. The mountains seen above Caporetto are the foothills of the Julian Alps. The Italian Army has retired across the Friulian Plain to the Tagliamento. The character of this river is shown in the top picture, also its breadth as judged by the bridges

WINTRY WEATHER

Hot OXO is an inestimable boon to the fighting forces at this time of the year.

It aids and increases nutrition; it stimulates and builds up strength to resist climatic changes, and is invaluable for all who have to undergo exertion either to promote fitness or to recuperate after fatigue.

OXO takes up little space, is easily carried, and can be converted quickly into a hot nourishing drink which, with bread or biscuits, will sustain for hours.

Be sure
to send

OXO

OXO Ltd., Thames House, London, E.C.4.

Names and addresses of shops, where the articles mentioned can be obtained, will be forwarded on receipt of a postcard addressed to *Passe-Partout*, LAND & WATER, 5, Chancery Lane, W.C. 2. Any other information will be given on request.

A Christmas Catalogue

It is not a moment too soon to turn the question of Christmas presents over in the mind, especially where "our flogging battle-line" is in question. Presents for the men at the front have at last shaken down in the way they should go. The rubbishing superfluities have vanished in all the bettermost shops and in their stead are things men really want and will welcome when they come.

A small catalogue has just been issued called "Things a Soldier Needs," and it is nothing short of invaluable just now. It is the result of expert inquiry into the matter, the result being all that can be wished. With this at hand anybody can choose the psychological thing a man on active service wants, one or two particularly novel ideas being not the least interesting propositions.

A specially light suit case for billet or camp arranged to take a man's own fittings is one of the capital suggestions, this being the sort of thing that simplifies packing. Then there is an admirable writing case, a new design, perfectly adapted to the peculiar needs of the moment.

Men in the trenches should send for this catalogue also, it being as useful to them for Christmas present suggestions as for those at home. All sorts of things a woman likes are illustrated as well, and special arrangements have been made by which orders from over the water are carefully dealt with. This catalogue, indeed, which will be sent anywhere on request, makes shopping the easiest and most interesting thing in the world, eliminating as it does all undue bother.

Substitute for Milk

Without a doubt the wise amongst us will prepare as much as possible for several eventualities this winter, amongst them the fact that there may be a shortage of milk. Even if it is—as it is hoped—avoided, it seems fairly clear that there will not be an over-abundance of supply, and any way in which we can we should decrease the demand. It is only patriotic to do so.

Substitutes but rarely approach the thing they substitute, it is foolish to claim that they do. Without any fear of exaggeration, however, any amount of good points can be allowed to Solac, the synthetic milk in powder form. With a tin of this in the house a lack of milk does not so much matter; it can be used for cooking, as a drink by itself, makes a capital cup of cocoa, and can, at a pinch, be used with tea or coffee, though with the last it does not colour in the same way ordinary milk does.

People accustomed to drink a glass of milk the last thing at night should try Solac; they will find it particularly nourishing and wholesome. The best way to use it is to mix a proper quantity of Solac to a paste with a little hot water, and then add either cold or hot water as the case may be. Properly mixed, it is quite impossible with the naked eye to detect it as anything but milk.

A quarter of a pound costs eightpence, half a pound one and two pence, one lb. two and threepence, and there is the plain as well as the malted variety, the latter being capital for all liking a malt flavour.

A Cold Weather Drink

The same people also are selling an excellent drink for the cold weather, this having the effect of cocoa and milk combined and sweetened. To call it milk, however, is a misnomer. It is not milk, but Solac in another and a most useful form. Its many conveniences, indeed, would work out to a lengthy tale; but suffice it to say that here at hand is a most readily prepared drink, and a very nutritious one into the bargain. It has a very pleasant malted flavour, and is the easiest thing in the world to mix. Putting some into a cup, adding boiling water is all that is required. And there it is! A capital drink for a cold day.

This also is in powder form and put up in quarter, half and pound tins costing eightpence, one and two, two and three respectively. At any time this cocoa and "milk" combined in powder form would probably make a stir, but at the moment its very considerable importance is ten times enhanced, taking the place as it does of things the times are making uncertain

(Continued on page 22)

**UNLIKE ORDINARY PUTTEES, OUR NEW
ALL-LEATHER PUTTEES
NEVER TEAR OR FRAY OUT.**

For winter wear they are unmatched.

These most comfortable, good-looking puttees are made entirely of fine supple tan leather, and fasten simply with one buckle at bottom. They are extremely durable, even if subjected to the friction of riding, as the edges never tear or fray out.

The puttees are speedily put on and taken off, readily mould to the shape of the leg, are as easily cleaned as a leather belt, and saddle soap soon makes them practically waterproof.

The price per pair is 18/6, post free inland, or postage abroad 1/- extra, or sent on approval on receipt of business (not banker's) reference and home address

SERVICE OUTFITS and REFITS

To the requirements of the officer on leave, with much to do in little time, we give the utmost consideration. Tunics, breeches, slacks, we make speedily, yet thoroughly, and at hand we have leggings, puttees, gloves, shirts, ties, etc., so that wants of this kind may all be satisfied in one visit.

FURNITURE AND EFFECTS

to the extent of over £70,000

THE FURNITURE AND FINE ART DEPOSITORIES, LTD., have been favoured with instructions from the various trustees and owners who have been called to serve with His Majesty's Forces to SELL PRIVATELY. In many cases entirely without reserve and regardless of original cost, the ENTIRE CONTENTS of SEVERAL TOWN and COUNTRY MANSIONS, being one of the greatest collections ever offered to the public, including styles of Elizabethan, Jacobean, Queen Anne, Chippendale, Sheraton. Write for Catalogue.

THE FOLLOWING FEW ITEMS will suffice to give an idea of the exceptionally low prices at which these goods are being offered:—

DINING-ROOMS and LIBRARY include a complete dining-room set in solid oak all to match, 17 gs.; complete dining-room set in solid mahogany of Queen Anne design, £23.

SET OF EIGHT CHIPPENDALE STYLE DINING CHAIRS, covered morocco leather seats, 14 gs.

QUEEN ANNE DESIGN BUREAU BOOKCASE, £6 15s.

EASY CHAIRS, LOOSE DOWN CUSHION SEATS, 47s. 6d.; Chesterfield Settees to match, £3 7s. 6d.; Turkey Carpet, good condition, £6 6s.; grandfather and bracket clocks, old crystal table glass, polished oak canteens of cutlery by Mappin and Webb, quantity of plate, etc.

THE DRAWING-ROOM FURNITURE, in styles of Chippendale, Hepplewhite, Louis XIV., and Louis Seize, carved and gilt, satlwood cabinets, screens, settees, chairs, tables, etc., in addition to over 150 Chesterfield settees and lounge easy chairs, all being offered at less than one-third original cost.

THE BEDROOM APPOINTMENTS in modern and antique styles include complete solid oak suites from 5 gs., ranging up to magnificent decorated and French lacquered and inlaid suites, complete with bedsteads, up to 400 gs. BOW-FRONT AND OTHER CHESTS from 35s.

FINE GENTS WARDROBES and TALBOY CHESTS, from £3 15s.

THE BILLIARD-ROOMS, LIBRARIES, and HALL APPOINTMENTS include several Persian, Turkey, and Oriental carpets and rugs, two full-sized billiard tables, also a smaller.

30 BABY GRAND, BUDOIR, and other PIANOS, by eminent makers, from £5 15s., including a "Steak" and other combined Player Piano.

COLLECTION of BLACK and GOLD LACQUERED FURNITURE, CABINETS, CHAIRS, TABLES, etc.

Any article may be had separately, and if desired, can remain stored, or will be packed free and delivered or shipped to any part of the world.

COMPLETE CATALOGUES, ILLUSTRATED BY PHOTOGRAPHS, NOW READY. SENT POST FREE.

CAB FARES FROM ANY PART of London, also railway fares allowed to all customers. Business hours every day, nine till eight.

TRADITION—

Although the organisation known as the B.S.A. Company is a brilliant example of modern efficiency in manufacturing, yet it is steeped in tradition. Founded on an ideal—the production of the finest rifles in the world—the principle of the founders have been zealously guarded and nurtured in the succeeding generations so that now the whole corporation is saturated and imbued with the maxim—

QUALITY FIRST.

It is not too soon for all sportsmen and rifle enthusiasts to send their names and addresses to ensure the earliest information as to the Company's post-war productions in

B.S.A.

"THE ORILUX"

THE ONLY ELECTRIC LAMP WHICH HAS STOOD THE TEST OF ACTIVE SERVICE FOR YEARS.

EXTRACTS FROM LETTERS FROM THE FRONT:—
"The most useful article in my kit."
"I hear nothing but praise of your lamp on this side."
"You have made your name famous amongst officers."

THE ORILUX LAMP is fitted with switches for intermittent and for constant light. The light can be turned on without opening the case, which is fitted with a hood to throw the light downwards. The case is provided with loops for attaching to the belt, and provision is made in it for carrying a spare bulb.

THE ALLIED WAR COUNCIL

THE exact functions of the Allied War Council, and the precise causes which led to its creation are doubtful, but there can be no question that its success depends entirely on one factor—whether or not it enjoys the confidence of the soldiers in the field. The speech which the Prime Minister delivered in Paris has further clouded the issue instead of elucidating it. There are occasions when Mr. Lloyd George seems to follow the example of Mr. Gladstone, and to become "inebriated with the exuberance of his own verbosity." Certainly in his Paris oration rhetoric carried him off his feet more than once, notably in raising again his old cry of "Too late." If the Italian disaster has been due to "too lateness," who can be more responsible for it than Mr. Lloyd George himself, seeing, as he told his audience, he was "almost the only Minister in any land, on either side, who has been in the war from the beginning to this hour." And if he be right in claiming that this disaster was the natural corollary of lack of unity, why did he not effect this unity before, and not after, the disaster or failing to do so act as he now threatens to act and resign office. Mr. Lloyd George has spoken finely and inspiringly on the war, but he is too easily betrayed into his old political habit of uttering persuasive words and delivering picturesque sentences just for their immediate effect. The result is to weaken public confidence in his judgment, and to strengthen still further the strong suspicion which the nation has come to entertain for politicians of all sorts, but especially for politicians who use their place to interfere in military strategy and tactics. It is seldom that a rhetorician is a man of action or *vice-versa*; certainly this war has furnished no instance of this rare combination; and for a politician or a collection of politicians to dictate to the commanders in the field, and to the organisers at home, how they should conduct the technical side of naval and military operations is to invite worse disasters.

Unity of action is most desirable, and if it is accomplished by this new Council, it will be warmly applauded. But where do the Council's Military Advisers come in, and what will be their duties? If only to advise the Council on the significance of military action, well and good, but directly they pass beyond this, they run the risk of interfering with the Commanders in the field and the organisers at the seat of Government, wherefore it is most essential that their functions be clearly defined. The public has been considerably perturbed by certain paragraphs which have been allowed to be published in the Press this week hinting that Sir Douglas Haig and Sir William Robertson are becoming war-weary, and might be glad to be relieved of their posts. Anyone who knows either of these distinguished soldiers is perfectly well aware that if there was a scintilla of truth in these innuendoes, the first intimation would have come from the officers themselves and

would not have been left to obscure political hacks. Who has inspired these paragraphs? What is the true inwardness of them? Why should they coincide with the announcement of the creation of this new Council? Our soldiers are fighting amid terrible mud in Flanders, are they also to be compelled to fight amid worse mud at home? This would be disgraceful. Field Marshal Haig has the full confidence of his army and the steady progress which he has made during the last seventeen or eighteen months speaks for itself. But there has been nothing theatrical about it, nothing to inspire gigantic headlines or grandiloquent orations, but for sheer tenacity and dogged perseverance there is no finer achievement in the long annals of the British Army. As the Field Marshal would be the first to admit, these victories are in no small measure due to that organiser of victory, Sir William Robertson, Chief of the General Staff, who has brought to his work unrivalled abilities, absolute sincerity and a positive refusal to mix himself in political questions. His single-mindedness has won for him the complete trust of the nation; they know they can rely on his word, and that he never makes demands on the people which are not fully justified by conditions. He is a power in the land, and were he to find himself compelled to resign his present position from any untoward circumstance, the effect on the country would be disastrous.

Hitherto we have confined our remarks to the purely military aspect of the Allied War Council. But there is another side—the political—where this Council may be able to effect great good. It is doubtful whether hitherto there has been a sufficiently well-informed appreciation of the internal difficulties each Allied Nation has had to contend with. These difficulties have been rendered all the greater by the cunning propaganda of the enemy, which has not hitherto been adequately recognised. It has been taken for granted that once an army is in the firing line little attention need be paid to the adverse and subterranean influences brought to bear for the purpose of weakening the resolution of the people. We see these influences at work in this country, and next to nothing done to counteract or check them. Were the members of the Allied Council to compare notes on this subject, there will, we are convinced, be discovered a remarkable similarity in the methods employed. If more active steps are not taken to suppress this enemy propaganda without further delay, we shall have Mr. Lloyd George again declaiming about "too late." Not only is Great Britain determined to carry the war to a completely victorious conclusion, but so are the Dominions. Nevertheless, not a living soul in the British Empire believes it can be done by the politicians outstepping their natural place and posing as strategists. This way lies calamity. There must be as loyal an alliance between the fighting men and the politicians as between the different nations. The strain of war increases and will continue to increase throughout the winter.

The British nation has just received a new scale of voluntary rations, with which the majority will endeavour to comply. But what about the minority, more especially that not inconsiderable section of aliens, who are to be found in almost every big city of England? What is to be done to keep watch over these and to see that while the Englishman tightens his belt the Galician does not loosen his, and, money being more plentiful with him than ever before, is not expending it freely on food without a single thought of the result in the aggregate. The fact is that lack of unity is not confined to the military plans of the Allies, but extends to their internal policies. We in England are assumed to be living on the fat of the land, with blazing fires to keep the cold from our homes, while Italy starves and shivers. We must face realities, both at home and abroad, but realities are the very last thing the politician has the slightest wish or desire to face, because if they be disagreeable, goodbye to his popularity. Such is his belief. However this new Allied Council is serving a good purpose in awakening the people to the truth that the war is far from being won. The victories on the Passchendaele Ridge bring us nearer to the end, but until the situation in Italy is retrieved, and the invasion stayed or driven backward, the hour has not arrived to look for the first beams of the dawning day. And the winter is still before us.

The Line of the Piave

By Hilaire Belloc

WE have all heard how the Italian Army is retiring upon the line of the Piave. The line of the Piave means, however, something very different from the general course of that river. Let us see what it means and what are its opportunities for defence. It may have been put to the test before these lines are published.

What we say here refers of course only to the geographical conditions, and comments based upon these are subject to two very important modifications: First, the strength or weakness of a line is clearly conditioned by the nature and number of the forces defending it as well as by its geographical nature. But as the strength of a modern defensive lies in such elements as counter-battery work, numbers of machine guns and skill in handling the same, ample munitionment, etc., we do not really know the strength of any line until or unless we have those details before us, and such details, in the case of the Piave line, we necessarily lack.

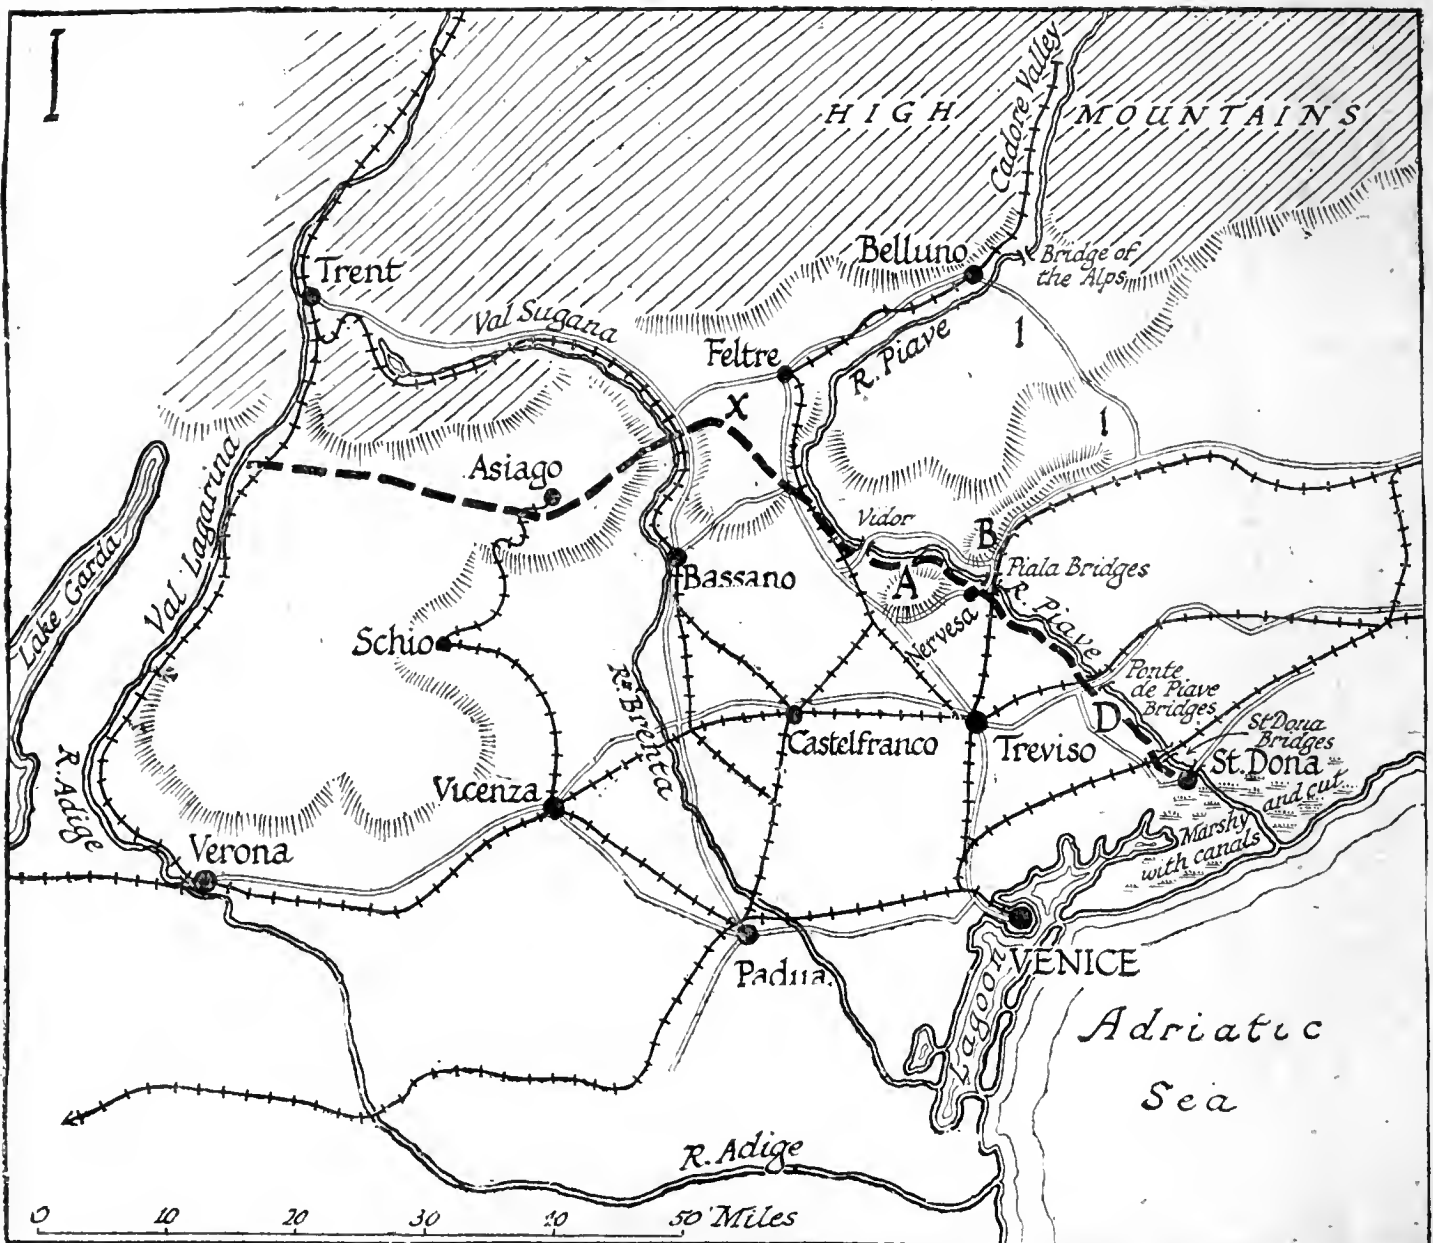

The second important unknown is the strength of fortification which it has been possible to erect within the time at the disposal of the forces which propose to stand upon a new line. During all the Battle of the Somme, for instance, and every other battle of the Western front, there has been a sort of race between the preparation of lines behind the front and the driving in of the enemy towards those lines. Preparation of lines takes time; the security of the defence is largely measured in terms of the time available for such preparation.

With these provisos, which are, of course, all-important, and which leave us with but little real material for judgment, let us turn to that little we have—the geographical conditions—and consider them.

The Piave is a stream rising as a mountain torrent in the Dolomites and collecting the water of a considerable mountain basin—all that district of fantastic peaks known in

Italian as the Cadore. It was the birth-place by the way of the great Leonardo. With the frontier which was here drawn arbitrarily and left a whole district south of the watershed in Austrian hands, we are not concerned. Our main point is that the Piave is not, in its mountain course, a very considerable obstacle. If the defence upon the further side of its narrow valley or gorge could not prevent the offensive from coming down the opposing slope, it certainly could not prevent its crossing the rocky waterway at the bottom. These mountain conditions continue to the point called the Bridge of the Alps just above Belluno. Apart from the fact that the obstacle is insignificant, the great length of this mountain part of the valley, something like 40 miles with its windings, forbids any attempt to use it by a diminished army. It has as a fact been abandoned! and unfortunately in the retirement from it a portion of a division has been cut off—with a loss of 10,000 men. The upper mountain part of the Piave valley, then, forms no part of the Piave line.

Below Belluno the Piave runs through country either flat or marked with low heights that are the last foothills of the Alps. It is now a more considerable stream, though still subject to great differences of level like all mountain rivers, but it is still far too shallow on the average to act as an obstacle and, further, is unsuitable as a line of defence from its trace. It makes a very wide bend westward, greatly increasing the line that the defence would have to hold, and this bend may be said to continue to the point of Nervesa, a village standing just above the right bank at the entry of the river into the Plains. It is from this point that the true line of the Piave begins and from this point that an attempt to stand defensively upon it must be continued by as short a line as possible up to the high mountains where attack in force is difficult or impossible. To exactly what point in the mountains the line is continued we have no information, but the straightest

and therefore shortest line would use a portion of the Piave above Nervesa to just beyond Vidor in the foothills, sacrificing Feltre and Belluno, of course, and holding the heights which form the northern watershed of the Brenta or Val Sugana and thence crossing the gorge of the Brenta join on with the existing line defending the southern part of the plateau of Asiago.

To the importance of this northern sector *behind* the line of the Piave I will return in a moment. Let me first describe the line of the Piave proper, from Nervesa to the sea.

Though the river is, as I have said an indifferent obstacle, like nearly all mountain streams (save the largest, which have a very wide basin and a long passage through the Plains), though the waters fall very rapidly after each freshet and are in great part of the length of the river divided into several channels which reduce the difficulty of crossing, yet the Piave has certain advantages over the numerous other rivers of this Plain. In the first place, its line in the quite uncovered open country is short; excluding the small loops of the river, it is but 25 miles from Nervesa to St. Dona, or rather the point on the western bank opposite St. Dona, where the sea marshes begin. As the crow flies it is little more than 20 miles. The most exposed part of the line, therefore, and the most vulnerable, is highly restricted. The width of the Venetian Plain between Nervesa and the Lagoons and marshes of the coast is at its least. There is a sort of waist here between the Friulian district on the east and the great Plain of Padua and Vicenza upon the west. Further, everything below the bridges of St. Dona is very difficult passage for an army at any time, and usually quite impassable by one. It is a labyrinth of marshy meadows cut by innumerable canals and merging into the meres and lagoons of the sea coast. For some miles above St. Dona—up to the point marked "D" on Map I.—the lower river is fairly deep and has difficult muddy banks: but above D the bed is a broad gravelly flat with numerous shallow branches of the river trickling through it: only after rain does it rise suddenly to a higher level and fill its banks.

The line then on which the Higher Command of our Ally has decided to stake so much is, briefly, one of three sections. The true obstacle between St. Dona and the point D; the insufficient obstacle (save for the strength of artificial work), from D to a little above Vidor; the mountain section which first follows the ridge watershed of the Brenta, and then turns west to cross that stream and to hold the Asiago plateau just south of the ruins of that town.

The political aspect of the matter is very important in the case of Italy, and we note that the Piave covers Venice and all the wealth and history of the towns beyond the Adige, which would be sacrificed if the Adige were made the defensive line.

Now let us consider the opportunities for supply and observation on either side.

The line of the Piave is very well served for the supply of the defence. Radiating from Treviso, which is to the Piave what Udine was to the Isonzo, there are three lines of railway

and, as will be seen from the map, a fourth comes in parallel with the sea serving St. Dona. Further, there is excellent cross communication joining these lines, the capital nodal point of which is the junction of Castelfranco. Good roads radiate from Treviso as the railways do, but there is none, or was none in time of peace, serving the line parallel to the lagoons, nor would it everywhere be easy to construct. The way along the coast to St. Dona Bridge is a tortuous piecing together of local lanes.

Unfortunately, the communications of the enemy for his approach to and attack on the lines are equally excellent. Apart from a whole network of excellent hard local roads he has, for a front of less than 30 miles, three first-class avenues of supply, each with its great high road and railway. It is improbable that the latter have been damaged in the very pressed retreat beyond what a few days can repair: for though there are on each an exceptionally large number of culverts over the numerous small streams of the Venetian plain, yet these are all quite short and low. The only considerable works being the two viaducts over the Tagliamento, the extent of the damage done to which we do not know.

These three avenues of supply reach the Piave, the northernmost at the Piala Bridge just at the edge of the plain, the middle one at Ponte de Piave, the third and southernmost at St. Dona. The railways of the first and last are double lines; a cross communication joins them up only 20 miles from what are (now that the bridges are down) the Piave rail-heads. It is a model condition of supply for an attack in the plain.

Meanwhile, though it has no railway leading to any enemy base, but only one ending at the hills, the open valley below Belluno has an excellent high road and cross-road system, and by it also a concentration could be effected fairly rapidly round from the plains by the main road from there to Belluno, which I have marked (1) (1) on Map I.—a broad, excellent highway for petrol traction.

As to observation, it is to be remarked that where the Piave goes through a gap in the foothills just above Novera either party has observation right over the Venetian plain to south and the enclosed flat of Vidor to the north: the enemy on the height marked B, the Italians on that marked A. The latter is, happily, somewhat the higher, but this advantage is not great, for from any part on the crest of B—which is from 600 to 800 feet above the plain, one can completely observe operations and view all about the northernmost river crossing.

Such is the line of the Piave with its strength and weakness. It has the military advantage that it is short, the political that it covers Venice and the great towns of the neighbouring mainland. It has the disadvantage that the obstacle—unlike that of the Adige—is very imperfect, that right on its flank and behind it is the threatened Asiago plateau, and that if it, the Piave line, be abandoned, all further retirement rapidly extends the trace to be held by the armies compelled to such retirement under the immediate pressure of superior forces.

Palestine

The retirement of the enemy in Palestine is not only of an importance, but even of a character which we cannot judge, because we have no enemy accounts and because the accounts from our side are necessarily little more as yet than the despatches to hand, but there are certain features in it which are clear enough already, and are worth tabulating.

In the first place it is clear that the British turning movement round Beersheba and the capture of that point involved the collapse of the whole Gaza line. In other words, it is clear that once Beersheba had gone, the Turkish command determined upon a general retirement which involved, of course, the abandonment of Gaza, and of all the defensive works organised against what the enemy calls rather absurdly "The Sinai front."

By Friday last, the 9th, over seventy guns had been counted, of which several were 5.9 howitzers; and General Allenby estimated on that day the total Turkish casualties, exclusive of 5,000 prisoners, to be not less than 10,000.

The immediate interest in this field is the line upon which we are now told the enemy will elect to stand: the line of the Wady Sukereir continued south-eastward to cover Beit Jibrin and the highest point and terminal in front of Hebron.

Let us consider the general nature of the country.

The structure of the land is exceedingly simple. It is all based on lines running parallel with the Mediterranean coast, and that coast is itself as simple as any in the world. A mere flat line; no natural harbours whatsoever, the whole making a line curving very slightly westward of south. Almost

exactly due north and south, and at a distance from the sea which varies from 70 miles at the southern end to some 30 miles at the northern, runs the valley of the Jordan, terminating in the Dead Sea. This great cleft is a depression far lower than the Mediterranean (the Dead Sea itself is only just under 1,300 feet lower, and the Sea of Galilee 687 feet lower, the valley of the Jordan in between sinking from the lesser to the greater depth).

Between this valley of the Jordan and of the Dead Sea and the Coast line of the Mediterranean, there is a backbone of high mountain land, not much larger than a large English county, upon which, as upon a stage, has been played the history of the Jews, of Christian origins, and of the Crusades. This great lump of mountain land, some 55 miles long from the Desert on the south, to Samaria on the north, is nowhere much more than 30 miles broad, is distinguished from the sea plain on the one hand, and from the valley of the Jordan on the other, not only by its ruggedness and its height, nor by the fairly rapid way in which it rises from the sea plain and the precipitous way in which it falls on to the Jordan valley, but also by the way in which its culture has, from immemorial time, contrasted with the culture of the coast on the west, with the Desert to the east, and with the almost tropical deep gorge of the Jordan, much of which men were compelled to leave half inhabited. From the point of view of military history, apart from the political effects on military history which the separation of races and religion involved—from the point of view, that is, of purely geographical military history

the two great marks of this land have been absence of obstacle and difficulty of supply. There is nothing interrupting movement from south to north, or from north to south; from the sea up into the highlands, or from the eastern desert on to the highlands. No one has ever been able to defend in any permanent fashion the line of the Jordan against an army from the east; no one has ever drawn a line barring entry from the north; there is no natural feature suggesting a similar line barring entry from the south, nor are there parallel positions in between. Indeed, the nearest thing to a permanent defensive line ever established against movement in this region would seem to be this last Turkish entrenchment, the line Gaza-Beersheba, which has just been turned and lost. The gulleys running down from the mountains to the sea, occasionally filled with water after a storm, normally dry or nearly dry, none of them afford a true obstacle or line of defence. They serve excellently for an approach

up into mountains from the lowlands. Each of them is famous in very early military history as a line of invasion up from the Philistine Plain into the Jewish mountain land. But they have never permanently served as transverse lines or obstacles to invasion from the south. The truth is that in this country any position chosen will be an artificial position. There will be trenches prepared from the mountains down to the sea, covering whatever the enemy may regard as of political importance or as suitable bases of supply—probably the latter.

It is in this second factor, that not of obstacle but of supply, that you get the core of military history in this region. Even to-day, with the immense resources of modern engineering and of modern science, the difficulty of supply is the whole business, and in the difficulty of supply the chief item is water for a force advancing from the south. A large force thus advancing to-day is tied, of course, to its railway, but also to its water pipe. The supplies of water increase as one goes, northward, but water is always the problem: much less so happily, at this season of the year than in summer. For the rainy season of Palestine is that we are now passing through. It ends with April, and the late spring and summer months are usually cloudless.

From the point of view of the enemy or of the defensive, the problem of supply is different. The enemy is falling back upon better and better water supply, and along an existing railway. Let us see from the configuration of that railway and of the roads coupled with his probable political interests, why he has chosen this line.

The main railway runs on the shelf of the hills above the sea plain—the plain which the Philistines held in Biblical times. The British have been moving up this main line above Beersheba. They now find themselves in front of the new Turkish line, and that line is clearly planned *first* for the advantage of lateral supply and *next* to cover Jerusalem. The railway branch from the junction of el Tineh we may neglect—it is mainly in British hands, and its last fragment is under fire. With the branch serving Jerusalem it is otherwise. As the line runs, this line is his main support, and he has further, immediately along his front, the Beit Jilsin-Hebron Road. If the enemy will stand with the Jerusalem branch at his back as a lateral communication serving his line, it will be a solution for him of the problem of supply.

The Conditions of Victory—V

Restoration : Reparation : Guarantees

GREAT, and especially unexpected successes in the course of any war, and especially in the later phases of any war have, apart from their material results, two moral effects upon the party against whom they are won. The first of these moral effects is the lowering of confidence. Victory breeds victory and defeat breeds defeat, because confidence in leadership, in the power to attain objects aimed at, etc., increases with the one and declines with the other. The second moral consequence is allied to this and consists in a confusion of aims, in a blurring or rather a disturbance of the political scheme for which war was waged. Considerable and especially unexpected victories in the later part of a campaign give to the party that wins them a still clearer view of its objects, while their opponents suffer not so much a reduction in their aims as a disarray in them.

The tremendous blow now being dealt by the enemy across the Venetian Plain is an exact case in point. It was certainly unexpected by him as by us. It has had exactly the moral results I have just mentioned, and it is our whole duty at the present moment to re-act against those moral results.

This is particularly true of the aims set before us in this war. There can be no question of reducing them, because they are the necessary basis of security. The practical aim is the destruction of the Prussian military machine, and if that cannot be done we have lost the war. If it can be done and *only* if it can be done, shall we be in the position to re-establish civilisation securely for the future.

In the formation of that future security we have said that the first point was the necessity for victory in the field—without it all the rest is talk. The second point, the practical fruit of such victory, is best represented in the formula laid down by the last administration of this country: "Restoration, reparation and guarantees."

Restoration simply signifies the giving up of those territories which the Prussian military machine has seized from its rightful owners, from which it has expatriated original inhabitants, and which it has attempted to colonise with its own subjects. It further includes territories long held against

the will of their inhabitants by the present Allies of Prussia. It has nothing whatever to do with the evacuation of territory temporarily and accidentally occupied during war. Such territory is often an asset which is used to bargain with when wars end in a truce or in an inconclusive peace. In other words, each party is really ready to yield what nothing but the chance of a few months has given him, and what a prolongation of the war might very well lose him. Territories of which he never calculated when he made war, and without which he can still remain exceedingly strong after the war.

With incorporated territory, territory seized by formal treaty of conquest, depopulated, re-colonised and the rest of it, it is another matter. The restoration of such territory is at once the symbol of our victory and a necessary part of our guarantees. We are fighting a Power which has, for two hundred years, quite openly maintained the principle that a European Power may, if it can, seize territory by force from a neighbour without so much as a legal excuse or fictitious claim. The Power which we are fighting regards that principle as vital. It has lived by that principle and its success has largely obliterated in the European conscience the old sanctities of treaty. So that most modern men have come to think of what they call "Annexation" as a sort of evil normal to all European history, while some are so ignorant as to believe that the abolition of it would be something modern and "progressive." The truth is, of course, that mere annexation by force from Europeans by Europeans is a modern evil, and that modern evil was created by the Power we are fighting to destroy. The idea upon which it reposes is a Prussian idea.

Behind this particular example of Prussianism there is another larger principle of which Prussia is also the support, though not the originator. It is the principle that dynastic claims, or the claims of self-conscious communities against alien governments are fantastic and vain, and that the only real test of the right to govern is the material effect of government. It would puzzle the supporters of this theory who are now to be found everywhere and who, since 1870, have held nearly all the field of political thought in Europe, to define what they meant by the material well-being of a community. Probably, if we could make them write down clearly what

they meant, you would find that they meant a great number of different and often contradictory things, such as the total of economic wealth without regard to its distribution; its good distribution without regard to its total; the presence of ample stocks of necessities; the presence of luxuries for a few though there be insufficiency of necessities; the growth of capitalism and of its attendant proletariat; excellence of communications, many trains and many and good roads; an orderly appearance in externals, especially in the estates and houses of the rich—plenty of varnish on woodwork and a high polish on metal work; an increase in the number of newspapers and in the statistics of the post office; the introduction of speculation; the gradual weakening of the family to the advantage of industrialism; scepticism in philosophy and so forth. All these things come in to the objective of "efficiency" as against free Government, and there is no common philosophy that really binds them together except the desire to look oneself in the glass and to mirror one's habits in others. The spirit of which I speak, and which we are combating in this war, has for its test, if we examine it closely, nothing more than the expansion over the subject territory, especially in externals, of whatever characterises the conqueror. The conqueror calls it by every sort of good name, the chief of which is that same word "efficiency," but what he means in practice is "an aspect like my own." He has, for instance, at home good roads and a ruined peasantry. He comes to a country with a flourishing peasantry and bad roads. He is quite sure that he has done something "efficient" if, after fifty years he has ruined that peasantry but created a number of good roads. If his philosophy is for the moment sceptical, the breakdown of religion is part of his idea of efficiency. If it happened to be a highly organised religion his idea of efficiency would be the imposition of that religion upon the conquered. The spread of his language again is "efficiency." The maintenance of the native language is the opposite.

Now the victory of the Allies means the weakening of those two principles, general and particular, and conversely the retention of such territories by Prussia and her dependents after the war would mean the defeat of the main Allied object. It would mean the defeat of a free Europe and the establishment for good of those principles which permit the subjugation of European nations by their fellows. No amount of promises not to do it again or not to extend what has already been done are of the least value here. Either the territories formerly annexed by force and partially colonised by force will be recovered or they will not. If they are not recovered we have lost.

Reparation

Reparation is in another category. It is a claim subject to modification from two causes. First: That a great and indeterminate part of the damage done is inevitable even to legitimate war, and secondly that the damage already illegitimately done, the wholesale burnings and lootings of which the enemy has been guilty probably exceed his power of economic reparation, however severe the terms we might be able to impose. But the principle is none the less clear. If European civilisation wins, those who set out to subjugate it having deliberately made terror their instrument must, to their own impoverishment, be compelled to restore as much as is materially possible.

The matter might be put thus: Supposing a peace to be concluded in which it is agreed that the various belligerents shall subscribe in proportion to their means for the restoration of things destroyed in the war. Then Western civilisation is humiliated and has accepted the moral principle which it went out to fight. It has accepted the methods of terror as normal to war, and it has established them. Nay, it has made itself a party to them.

It has admitted that the burning of Louvain, for instance, is something for which we are all equally responsible, because we are all equally belligerents, and in doing so it has admitted that the Germans were committing a normal act of war in burning Louvain.

In this connection English readers will do well to note a point which has been somewhat missed in this country because its territory has been spared invasion. The enemy carefully uses historical monuments and great towns as part of his scheme of defence in the West. He challenges his opponent to destroy these places or alternatively, if he is compelled to retire, to see them destroyed by himself. He did all he could to include Arras in his line, and when he drew a new one he exactly included St. Quentin (a better line in mere ground would have lain further from St. Quentin.) He is playing exactly the same trick with Laon, for he is preparing a new line apparently just in front of that town: Too close for the town and its junction to be of any use to him, but

so close that any attack upon him there involves the ruin of the town.

When we come to Guarantees, the very first principle to seize is that the guarantees must be material, or they are worthless. You must occupy territory and hold persons as hostages or you have no guarantee at all. People are at once less inclined to discuss this essential matter and too much tempted to misunderstand it because at this moment, and indeed ever since the collapse of Russia, all the guarantees in this sense are in the enemy's hands, with the exception of the German Colonies. Since the Italian disaster he holds in prisoners more men than the Western Allies hold of his—far more. All the occupied territory is now Allied territory held by him in the West. And the West in the sense of Italy, France and Belgium is, of course, the decisive field. Further, of the territory so held, one portion, the industrial northern belt of France and the whole of Belgium is of vital economic importance.

Lastly, there is the essential point that he has his shipping intact in his harbours, while he has been sinking at a prodigious rate the shipping of all neutrals and Allies, and especially that of Great Britain.

But that existing state of affairs has, like every other adverse circumstance, no bearing upon our thesis. If the enemy ends the war still holding these guarantees, he has won. It is he who has the hostages, and he who can impose his will. The fact that he is in that position in no way modifies the truth that we shall not be the victors nor our object even partially attained until we are in a similar position with regard to him.

Mutual Disarmament

Put a concrete case and see how it stands. Put the case of disarmament.

A peace is concluded. The enemy consents to evacuate the territories he now holds, and puts his name to a piece of paper promising that he will reduce his armament to such and such insignificant number in ships and men and material on condition that we do the same. We have no power to coerce him. We hold nothing of his which he will lose if he breaks his word. Let us suppose the process to begin and the Great Powers to disband, step by step and closely watching each other, their great forces.

No matter to what theoretical minimum this process may tend you cannot prevent a virtual escape from it either by people like the French and the English, who are determined not to suffer another surprise, or by people like the Germans who know that the English, especially, are vulnerable to attack at a comparatively small cost.

Prussia defeated and thoroughly broken, with hostages held while she repaired within the limits of the possible the damage she had done; her military machine smashed, and the lesson thoroughly taught, her energies occupied under the action of these guarantees in restoring what she had destroyed, would be no menace. There would be no temptation for the French and English to prepare a defence; there would be certainly no appetite upon the part of the beaten Germans to prepare a further aggression. But how on earth can you prevent an undefeated Prussia from having ready the materials at least for submarines or for aircraft? How can you prevent an undefeated Prussia against which you have no lever from using, in the air and under sea, forces, small at first, but a surprise by which would in the first few hours of another war, give her the upper hand, especially over an island community, and one densely packed with large industrial towns? And is it not obvious under those circumstances that Britain and France would be compelled of sheer necessity to establish a defensive scheme?

Every argument leads round to the same conclusion. It is an inevitable conclusion. Either there is a decisive peace resulting from the decisive destruction of the Prussian military machine, in which case you can break the will of its masters and establish permanent security in Europe, or there is an inconclusive peace, which is for the moment a defeat of the Western Alliance and in its ultimate effect an armed truce, probably of short duration.

There is only one alternative to such a conclusion, and that is the decay of the national idea; the growth of a state of mind in which people no longer cared for the ideal of an organised nation, and in which patriotism had ceased to be a motive. If this sort of political decay covered all Europe equally and affected the German Empire as much as other countries, then and then only would an inconclusive peace result in the cessation of these great international wars. They would be replaced by local wars and by class wars. It is a purely theoretical conception, for nothing of the kind can possibly happen. National organisms are too strong and their traditions too vital, in the ancient nations especially, for any such revolution to take place, and it is often remarked with amusement that those who in each nation most boast this

cosmopolitan disease, are quite peculiarly marked with the national stamp.

It would be a hideous conclusion in any case, but we need not worry about that, for it is an impossible conclusion. The war will come to an end—the present war—upon a national basis so far as the West is concerned, and one of the two opposing national systems will, at the end, feel victorious with all the consequences of that emotion.

The first of these national groups is the German organised under Prussia and controlling Central Europe. The second

is that of the British and of the French in alliance: two very different civilisations, but both Occidental, both ancient and deeply rooted; both intensely national, and both inheriting traditions for which the Prussian theory of war is death.

There is no more room for the two opposing ideas than is room for both of two men struggling on a precipice path. The one must master the other or be mastered. It is as great a tragedy as the most extravagant pacifist could describe it to be. But it is unavoidable. One of the two must go down.

H. BELLOC

Russia the Incomprehensible—II

By Charles Edward Russell

THE wonder about Russia is, not that some things do not seem to go well, but that anything goes at all. It is not that some conditions seem to show chaos, but that any conditions show anything else. According to all human experience and history the only normal thing to follow the Revolution was maelstrom and smash.

Consider! An enormous hulk, the product of centuries of effort of one kind and in one line, had borne up the whole structure of organized Russian society. The eyes and minds of all men were always upon it; it regulated even the minutiae of their lives. In a moment this huge thing turned turtle and went down. Naturally it should have dragged everything loose in its swirl. Always heretofore the violence of a revolution has been tuned up to the cruelty of the oppression against which it recoiled. It has always been like a tree bent over and then let go; it has rushed almost as far in the other direction. The oppression in Russia was the most savage, implacable, blood-guilty and maddening that has been known among civilized men, certainly since Caligula. It was of the kind that relishes cruelty for its own sake; that develops an exquisite and dainty taste in cruelty. Thoughtful men, looking upon it, always felt that if it should ever be overturned, blood would surely have blood and anarchy would pay the price of a monstrous wrong built of murder and tears. Wisdom and prophecy never went further astray. The Russian Revolution, when it came, was not only the least sanguinary of all great revolutions in history; it was, all things considered, remembering its occasion and size, the most moderate, the least impassioned. What happened has no reproach for the Russian people; on the contrary, it ought to be hung up for their everlasting praise. Whatever jarred as it went along, or still jars, was the logical, natural, inevitable result of the things the Revolution rooted out.

As soon as the Revolution came most of the existing local governments in Russia went out of business and their places were taken by Provisional Committees, which steered the machine until new City Councils could be elected. The world has been made to resound with tales, real and fictional, of things all askew in Russia. Nobody had ever pointed out the fact that most of these committees, although made up of men that about such a business were greener than grass, turned off an exceedingly workmanlike job of municipal management.

Kronstadt, of course, went with the rest, only farther than many. Instead of a Provisional Committee, it put all the local power into the hands of its Council of Sailors' and Workmen's Delegates, which immediately took the wheel and began to run things.

Probably the Council had its head turned. Men suddenly swept out of slavery into great power are not usually noted for a sweet and lamblike disposition. Anyway, the Council sent word to the Provisional Government in Petrograd, demanding to be represented in its deliberations. The only notice the Provisional Government took of this was to send a man to represent it in the Kronstadt Council. This was the worst possible species of misplay. As one of the Kronstadt men, who had been in America, put it to me, it was as if the Senate at Washington had refused to seat a Senator from New York, but had sent one of its own members to sit in the New York Legislature. So they seceded, started an independent Republic of Kronstadt, and walked their wild and picturesquely lunatic road until they crashed into the Cossack machine-guns that July day in front of the old Duma building. After which the Independent Republic of Kronstadt seems largely to have disappeared from the scenes.

But all this sort of thing opened the door wide to that most ingenious of human devilries, German propaganda, and after the first few days there was plenty of trouble, all of a familiar brand, being truly made in Germany. German agents were at that time chiefly busy along the whole Russian

front telling the soldiers that the Revolution's creed of public ownership meant an immediate division of all the lands, and if they wanted to get in they must be on their way home, but in the intervals of these employments time was found to foment disaffection at Kronstadt or elsewhere. The vast army of German agents that infest Russia found such things all in the day's work.

Here is where most of the difficulty lies in getting the Western world and Russia straight with each other. It is psychological. We are willing to admit, in a general way, that the old regime in Russia was pretty bad, but it is the kind of thing that we cannot really sense and feel unless we have seen it, and as for describing it, nobody can do that because there are no words in use among men that seem to apply to it. It was not merely a form of government belonging to an age in human history long gone by, and it was not merely a frozen horror crushing down upon the hearts and lives of men. It was also a vast and curious foundation for that government, carefully, cunningly built and developed by generations of astute minds. In the end the base became one of the most astounding products of man's tireless ingenuity, infinitely more wonderful than the thing it held up.

Every year, you might say, the government system of Russia demanded of depravity a greater skill to keep it going. The task was to maintain a primitive despotism in an age moving swiftly toward complete democracy. The faster the rest of the world forgot the Stone Age the harder the task became to preserve a social system suited to nothing else. The two chief assets in the vast, elaborated and scientific business they built up for the minute supervision of people's lives were terror and ignorance. By maintaining Russia in a state of perpetual perdition for all persons that were suspected of favouring freedom, it was possible to hold over all such minds an unchanging fear of a still worse perdition—which was Siberia.

People that know freedom and were born in it can no more grasp the meaning of this than a blind man can grasp the tones of a sunset. Russia lived with a huge iron heel upon her breast. This was the marvellous police system, divided into three main organizations. There was, first, the mounted gendamerie, heavily armed, ready to ride down any manifestation of disorder. Then there was the acknowledged city police, black-suited and menacing, chosen for physical strength and aptitude for cruelty. These were known and (with reason) feared of all men. There was scarcely a block in a city or town that was not patrolled by them. But the true wonder, of course, began with the third division, or secret police, whose strange network of espionage wound itself round every hearthstone in Russia, peeped in at every window, listened at every keyhole. It was this that chiefly kept the Czar's crown on his head and his head on his shoulders, year after year.

Let me see if by some examples I can convey to those that have never known anything but freedom an outline of life as it was under the Russian police. Say that there were two friends among the Intelligentsia, the class most suspected and pursued. If they rode down-town in a trolley-car of a morning going to work or business, they never dared to exchange more than formal salutations and sometimes not even these. If the car conductor were not a police-agent in disguise there was sure to be a police agent lurking among the passengers. Almost any innocent remark dropped by either friend might be reported as of sinister import, entered against them in the colossal records that the police maintained, and used at any time as a fingerpost to Siberia. In restaurants you must guard every word with the greatest care; the waiter is probably a disguised policeman. Be careful about your cabman; many police-agents have lately taken to driving cabs. A beggar solicits alms at your door, he may have been sent to over-hear a disloyal expression or take note of your callers. Write your letters with scrupulous attention; they will probably be opened

and read. Be most discreet about your telephone conversations; it is well known that every wire is tapped.

Police Agents

Every educated man was particularly likely to be an object of suspicion. The mere fact that he was educated proved that he must know something about the outside world of progress and its opinion of Darkest Russia; he could not know that without some degree of discontent. Such a man could never be sure any moment of the day or night that the eye of a police-agent was not watching from some undiscovered hole, that the ear of a police-agent was not listening at an unsuspected cranny. If such a man seemed to be of careful and unobjectionable walk, this sometimes served to make the police administration only the more suspicious of him, and then the *agents provocateurs*, the worst of all the instruments of evil, were loosed upon him. Someone in apparent distress begged his help and told a pitiful story of injustice or of police cruelty in the hope that he might drop an expression of sympathy. Canvassers tried to get him to subscribe for suspected journals, book-agents tried to sell him proscribed books, and visitors dropped upon his premises revolutionary literature that it might be found there and used against him. He was likely to find at any time that his private papers at his home or office had been mysteriously rifled and yet he could never detect the stealthy person that rifled them.

The *agents provocateurs* were in cunning and wickedness not less than human devils. Their business was to get up outbreaks or overt acts that suspected leaders of the people might be trapped and the rest might be terrorized with the spectacle of a swift and terrible retribution. They wormed their way into all clubs, societies and organizations, even when these were of the most innocent or benevolent character, that they might take advantage of men off their guard and discover usable evidence. Among the secret revolutionary and propaganda Leagues they had always members. These sometimes spent ten years in one organization before they were able to pull off the thing they were after. Very often they themselves would suggest a plan and help to carry out the assassination or bomb explosion with which they dragged down their quarry. Most plausible, ingenious, skilful men and wonderful actors they must have been. When brother suspected brother and son suspected father they still managed to pass undetected (sometimes) in the most active revolutionary circles. The world read with incredulity the confession of Azof, one of their master-minds. Yet it is quite true that, as he said, he had worked at the same time with the police and with the Revolutionists, and had betrayed both. To win the confidence of the Revolutionists he revealed to them the secret plans of the police, and when the time was ripe revealed to the police the secret plans of the Revolutionists. He cleverly avowed that he suggested, planned and took active part in the killing of the Grand Duke Sergius and then revealed to the police all the Revolutionists who had helped him in the assassination.

He was but a type. There is not a question that the hideous system developed and maintained by Russian monarchy developed in turn new abysses of turpitude in human nature and new kinds of skill to carry out new and revolting inventions in crime. Compared with the horrible wretches that this system spawned and trained, Titus Oates and all the other historic scoundrels look almost respectable. Treachery was everywhere; men inhaled it with every breath; they ate it and lodged with it and went hob and nob with it along the streets. Life became literally blackened, cursed and poisonous with suspicion, and generations of freedom must pass before the human heart in Russia throws off the last taint of the most detestable poison with which every vein of it has been clogged so long.

Turn then to the fact that in the midst of all these conglomerate horrors the revolutionary doctrine was spread, the revolutionary plans were laid, the doctrines of advanced freedom and democracy were steadily promulgated, until Russia was at last made free, and you will agree with me that here is a truly wonderful people.

The Russians that spread revolution in these years, very often obscure and unrecorded heroes, worked always under the shadow of a fate that was worse than death. When a spy's revelations had come, or the bomb had been thrown, those that were hanged were usually the most fortunate. The others, if they were leaders, faced shocking tortures first and Siberia afterward, and when Siberia meant the "cold *katorga*" death was always far more merciful.

Exile to Siberia had a wide variety of meanings. Thousands of men and women were termed exiles that suffered no greater hardship than to be turned loose in a wild, remote country and allowed nine ceats a day for food, clothing and shelter. Because this was not quite amendable and because of the

stories of the amusements of the rich exiles at Irkutsk, the notion has spread about the world that Siberian exile meant no more than to be separated from one's home and familiar haunts. Some writers, who must have gone soft upstairs, have even tried to shed a romantic halo about it, as if Siberia to a Russian revolutionist, was about like France to a Jacobite. It was the men and women no more than suspected of revolutionary sympathies that drew Irkutsk and exile within the fringes of civilization. Those that had actually raised their hands against the existing order fared very differently, and learned with lashes on their backs as they were driven into the mines or herded in huts in the Arctic Circle what kind of revenge unhampered monarchy takes on those that dispute its divine right.

There was, for instance, a camp just by the mouth of the Lena River, reserved for the most detested offenders, where the tortures were so exquisite and fiendish that the principal business of the guards was to prevent the maddened victims from finding release in suicide. The place was so close to the North Pole that the Arctic night lasted for months. In this gloom the prisoners were not allowed to have anything to read nor enough artificial light to enable them to find in work any distraction for their minds. The demon that devised this torment certainly went far beyond all the inventors of racks and thumbscrews, for the place was reserved exclusively for men and women of refinement and education upon whom its horrors would weigh most heavily. He judged aright, whoever he was; most of the victims went insane.

Looking calmly into the face of such a destiny, the revolutionists, harassed by the police and surrounded by spies, went on with their propaganda and saturated the greater part of Russia with it, and I do not believe the history of liberty has anything finer or prouder to show. Thousands of her patient unselfish soldiers perished in the long fight and left not even a shadow of a name. Every trace of them was annihilated by the iron heel that crushed out their lives.

A Living Tomb

The world may take Siberia lightly; to anyone that knows the Russian history it will always be a word of tragic import. In seventy years there passed through one Siberian town on the sorrowful highway more than 900,000 exiles. You may judge from this fact how extensive was the police business of manufacturing terror. When the sunlight of the Revolution broke upon this wilderness of despair every political exile and prisoner in Siberia was at once decreed to be free. There were more than 120,000 of them in Siberia and of these 20,000 were in camps and places so remote from the world of men that by July they had not yet been reached with the glad tidings. You may judge from this fact how truly Siberian exile was a living tomb.

Russians are among the most generous of people, tolerant, kindly and almost singularly free from any vindictive impulse. The day came when the men that had been responsible for all this red world of pain and misery, this "draining of eyelids, wringing of drenched hands, sighing of hearts and filling up of graves," fell into the power of the people they had wronged and tormented. Not one of the red-handed murderers, from the Czar down, was injured in a hair of his head. The worst that has happened to any of them is to be confined in a palace or a fortress. Even when indubitable high treason was added to their other crimes they escaped the firing-squad they had earned. All except the police. It was the hated police that fought the Revolution. It was the police that mounted the rapid-fire guns on the roofs of the houses and mowed down the people in the Nevsky Prospekt. All those buildings by the canals, around the Ministry of Agriculture, along the Morskaja and elsewhere that are pitted now with bullet marks, got their ornamentation because the people in the streets must fire at the police on the roofs. Those green graves in the midst of the sandy waste of the Field of Mars are filled every one with the victims of the police, and it was the police that the crowd beat to death and flung into the canals when the tide of the Revolution rose high enough to overflow the vicious old system at last and deliver the oppressors into the hands of the oppressed.

The day of retribution had come. But it was only upon the police that the vengeance of the people fell. The hated black uniform had disappeared from the streets. When the battle on the housetops began to go in favour of the popular cause the rotten old police structure fell with a crash. The people insatiably hunted black uniforms in the ruins. Next day the ice in the canals was covered with the bodies of policemen, and all those still left alive had fled in disguise or were locked up in that island fortress to which they had dragged so many of their victims. And the great, wonderful system of interwoven espionage, the great army of spies, listeners, lurkers, eavesdroppers, weasels, ferrets, hvenas, Black Hundreds,

police-hounds, dirty dogs, human wolves, wire-tappers, and the rest—what became of all that?

It sounds like a tale of unreality or magic, but the whole thing dissolved like a mirage. One moment it was oppressing all men's hearts with its scowling and unassailable front. The next, it had ceased to be, and the wolves, ferrets and hyenas it had nourished were in full flight. The fear of God must have come upon them; very few have ever been found. Some got over the border in safety, to Sweden or Germany; many in disguise still hide in unsuspected holes; some have, under assumed names, enlisted in the army. One at least, even in the terror of those hot hours, did not lose his cunning. With one exception the only buildings the crowd destroyed were police-stations; to-day every police-station in Petrograd is black ruins. A crowd with torches was marching from one station to another.

"Comrades! Comrades!" shouted a man, springing upon a doorstep. "To the Justice Hall, to the Justice Hall!"

So he led them to the great white building, the hated place whence so many patriots had been sent to Siberia, and they burned it to the ground, and it contained all the secret records of the police spies, who they were and where they lived and on whom they had spied. The wolves, ferrets and hyenas breathed freely again. Their identity will never be made known now.

That was the limit to which the violence reached; the tidal wave of chaos normally due from so great a convulsion never arrived. Petrograd and all Russia lapsed into a state of acquiescent good order and good nature. The people had destroyed the old autocratic government; they took no interest in punishing the elegant thieves and scoundrels that had conducted it. It was probably the worst government that ever existed on this earth. Autocracy is always rotten and always a curse; this was rotten beyond all previous records of autocracy, and a curse that made the plagues of Egypt seem negligible. It contained men that had stolen the money appropriated for rifles and sent unarmed Russian armies to

the front to be slaughtered. It contained men that for a price had betrayed Russian armies into places where they were caught and shot down like rabbits in a trap. It contained men that had stolen food from soldiers' lips and clothing from soldiers' backs. It contained men that had stolen cartridges from soldiers' belts and shells from great guns. It contained men that wallowed in millions they had stolen from taxes wrung from peasants and half-starved workers. It contained men that had agreed to sell their country to Germany. Not one of these was hanged. The evil they did lives after them and will live. They and their kind crippled, broke down or ruined every part of the Russian Government machine.

Since the Revolution new men have arisen of character and high purpose. So great was the destruction wrought by their predecessors that the new men must erect practically a new machine. They cannot erect it in a day; they are still hobbled with a million fragments of the old regime, and from that fact alone comes a black flood of troubles. Then there is German propaganda, able, adroit, marvellously organized, marvellously handled, equipped with unlimited quantities of counterfeit money, that many persons cannot tell from the genuine. There is the great army of German agents always secretly spreading poison. There are the Millennium people that believe the Russian Revolution ushered in the New Jerusalem and the Pearly Gates and furiously reject anything less. There is the large and active element that is against everything and doesn't know why.

With courage and patience the men of the new order confront these difficulties. It will not be because of the commanding and overawing genius of any one man that they will win. We seem determined in this country to have somebody spring up in Russia with "a rod of iron." There will be no such man; there would be nothing for him to do if there were one. Because the strength of Russia and the power that will solve all her difficulties is not the superior gifts of any individual, but the great good sense and strong democratic impulse of the Russian people.

Discipline and Human Nature

By Sapper

THERE are times when the mere soldier—undisturbed as he is by Trades Unionism and strikes—regards with a certain wonder the condition of affairs at home. He reads in the paper a few speeches by people of great mental ability; he reads a large number of speeches by people without great mental ability. He sees remarks such as—"If employers and workmen will pull together with all their might, between them they will pull us through"—and many others all indicative of the same state of mind. And having read them and pondered them, and plucked an acre or two of France from his person, he relapses, as I have said, into a certain troubled wonder.

As an officer he realises that he is in the position of an employer; that his men are in the position of workmen. He realises that until very recently he and his men were part of those about whom these speeches are made, and these pious hopes are uttered. And having got as far as that he wonders what has caused the difference.

There is no question of his workmen not pulling together under him and for him with all their might; it is a certain fact and they do it and have done it for months. New ones have come: old faces have dropped out; two good sergeants lie—one at Zillebeke and one near Lens—having finished the game and paid the last big price. But the platoon goes on, the company, the battalion whatever it may be, and it still pulls together without powerful speeches delivered twice daily. And he asks himself, Why?

Is it that the job in France is pleasanter than working in England? A dirty shell hole, plentifully supplied with slimy ooze; a fly-blown trench with the stench of dead things nauseating the air, and the sun baking down on the hot, dried up sand bags; a rest in the reserve line with the ever present jog of a working party always with one to keep people amused! And the other side—a home, decent hot meals always, the theatre and the picture palace with money to spend in them, the comfort and peace of England. The stagnation which leads to utter boredom on one hand—the work that keeps a man from it on the other; the constant risk of death on one hand—the practical certainty of safety on the other. And having got so far he decides that it is not because the job is pleasanter that the difference occurs.

Is it because the nearness to the accursed Hun has inspired those in France with a lofty ideal to crush the swine, to avenge poor suffering Belgium and martyred Serbia, which is absent from those far away? Is it a wild enthusiasm in-

spired by the entrance of Monte Carlo and Spitzbergen into the conflict that causes this contrast? Does anyone think that these things cut the slightest ice with a man who has spent forty-eight hours in an advanced strong point, splendid in its isolation, rich beyond all dreams in freezing mud?

Is it discipline? Is it fear of being punished under the iron code of militarism? Certainly it is amongst other things the first; as certainly it is not the second, which despite the lofty utterances of certain screamers of great vocal power is not discipline as we understand it. At times, this second-autocratic exercise of power is doubtless practised. With the German army it always is. And with them it is successful. That is the difference between the two nations; with us—when it is practised—it always fails. Our men must be led; theirs must be driven—and the difference is great.

But the real discipline—the proper sort; the controlling factor which must be exercised by someone if any community is to be kept together—what of that? It is not fear of the leader that is at the basis of it; one feels fear only for a taskmaster. Rather should it be a sense of responsibility; a feeling in each individual man that what he does helps or hurts the side, and therefore that what he does counts. For only with the sense of responsibility that is part and parcel of good discipline, will there come the desire to play for the side—the fulfilment of workmen and employers pulling together with all their might.

Why then, asks our mere soldier, does this discipline—this proper controlling factor exist in the mud of Flanders, and not elsewhere. And when he reaches this point in his thoughts he is very near the final solution of his problem. It comes to him that discipline for the Englishman, if it is to be successful, must be based on an intensely human outlook.

For the first time he finds that he has studied human nature—the nature of his workmen. More, he has lived with them, and suffered with them, and died with them. He has looked after their comforts; he has been their friend as well as their officer. He has cheered them up, and cursed them, and made much of them when they did well. And in doing all this he at last has understood them; while—what is just as important—they have understood him. Employer and workmen have met on the common ground of human nature; is it essential that they must part brass rags again simply because in civil life the money factor comes in? Further, is there not a possibility in the future of that common ground being reached without presupposing a war?

Venice : On the Giudecca

By Arthur Symons

FROM the Casa on the Giudecca I look across the water and see Venice. Is there another window from which one can see so much of the beauty of land and water? Opposite, along the Zattere, they are unloading the boats. I see the black hulls and a forest of masts and rigging. A steamer has come in from Trieste, and lies between San Giorgio and the Dogana, with its little black flock of gondolas about it. An orange sail creeps stealthily past the window, and I hear the sail creak against the mast.

High above the houses almost with the dominance of the Suleimaine at Constantinople, the great domes of the Salute rise above the green trees and brown roofs of the Patriarch's palace. That long line above the water, curving slightly until San Giorgio intercepts it, is the Riva, and at all hours I can watch it change colour, and sink into shadow, and emerge with the lamps at night, a dark outline, out of which the Doge's Palace rises, always white, always mysterious, always at once solid and exquisite.

Every day one sees, beside and above it, the greyish green of the bulbous domes of St. Mark's, the two columns of Syrian granite on the Piazzetta, and the winged lion of St. Mark, with his fierce laughter and alert springing body, who, from that height, challenges the ships.

This long narrow island of the Giudecca, with its houses now mere shells, granaries, storehouses, or cottages for fisher-people had its palaces once, and the Casa in which I am living was built by Palladio, who planned the Redentore on the left, and San Giorgio Maggiore on the little neighbouring island to the right. Everything in the house is beautiful and ample; the long courtyard opening through two stone pillars wreathed with vines upon the garden, the stone staircase, and the immense room, shaped like a cross without a top, its longer wall almost filled with tall and slender windows opening upon stone balconies over the water; windows at the narrow end looking over the garden, and beyond, the iron gateway, with its carved stone figures on the gate-posts, over the vast green and brown orchard and vineyard, stretching to the still waters of the lagoon on the other side of the island. There are timbered roofs, vast garrets, and a chapel with its lamp still burning before an image of the Virgin.

The guests sit down to their meals in the great hall, and are so far away from each other that their presence has almost a touch of unreality; one hears and sees them vaguely, as if in a dream, and the Venetian woman who waits upon us all, passing to and fro with a sleepy dignity, has little curls of hair hanging about her eyes like a woman in one of Carpaccio's pictures. Outside there is always sun on the garden, once a very formal garden, and now just dilapidated enough for its quaint conventionality to borrow a new refinement, a touch of ruined dignity. One may wander through low alleys of trellised vines to the water; and beyond the water, on the other side of a narrow bank of land, the sea lies.

There is, to those living on the Giudecca, a constant sense of the sea, and not only because there are always fishermen lounging on the quay, and fishing-boats moored in the side canals, and nets drying on the land, and crab-pots hanging half out of the water. There is a quality in the air one breathes in the whole sensation of resistance, which is like a purification from the soft and entangling enchantments of Venice.

On the other side of the water, which can look so much like the sea and form so rapid a barrier, yet across which every movement on the quay can be distinguished, Venice begins; and in Venice one is as if caught in an immense network, or spider's web, which, as one walks in its midst, seems to tighten the closer about one. The streets, narrow overhead, push outward with beams and stone balconies and many turning angles; seem to loosen their hold for a moment where a bridge crosses a narrow canal between high walls and over dark water, and then tighten again in close lanes where the smells of the shops meet and fume about one's face. The lanes are busy with men in rough clothes and with women in shawls, bare-headed and with great soft bushes of hair, who come and go quietly, slipping past one another in these narrow spaces, where there is hardly room to pass, as the gondolas slip past one another in the narrow canals. The road is difficult to find, for a single wrong turning may lead one to the other end of Venice.

This movement, the tangles of the way, the continual arresting of one's attention by some window, doorway or balcony, put a strain upon one's eyes, and began after a time to tire and stupefy the brain. There is no more bewildering city and, as night comes on, the bewilderment grows almost disquieting. One seems to be turning in a circle to which there

is no outlet, and from which all one's desire is to escape.

Coming out at last upon the Zattere, and seeing the breadth of water before one, it is as if one had gone back to the sea. The ships lie close together along the quay, ten deep, their masts etched against the sky; the water, or that faint shadow with its hard outline (almost level, but for the larger and lesser domes of the Redentore and the Zitelle) which is the island of the Giudecca. A few voices rise from the boats; the hulls creak gently, as if they were talking together; there is a faint splashing of water, and beyond, silent, hardly visible, unlighted by the few lamps along the quay, the island waits, a little desolate and unfriendly, but half way to the sea.

By Night

At night the moon swings in the sky, like the lamp of an illumination. There are curtains of dark, half drawn, and, higher in the sky, pale gold stars, like faint candles, in a dark which is luminous. Or, on an autumn night which is like summer, a moon like a silver medallion hangs low over San Giorgio, and turns slowly to gold, while the water, between moonrise and sunset, pales and glows, and the dark begins to creep around the masts and rigging.

Rain in autumn brings a new, fierce beauty into Venice, as it falls hammering on the water and rattles on the wood of the boats and settles in pools in all the hollows of the stones. Seen under that stormy light, just before sunset, with a hot yellow moon struggling to come through the rain-clouds, Venice is as if veiled, and all its colours take on a fine deep richness, seen through water, like polished stones in sea-pools. The slender masts, the thin black network of the rigging stand out delicately, and with an almost livid distinctness. The gondolas move like black streaks on the water. For a moment the west brightens, as the sun goes down behind a space of sky that burns white, and shivers dully, streaked with dim yellow and with fleeces.

There was a roaring of the sea all night, and in the morning, the water splashed under the windows, almost level with the pavements. The whole Giudecca was swollen, and rose everywhere into grey waves, tipped with white as they fell over. Sea-gulls had come in from the sea, and flew in circles over the water, dipping to the crest of the waves, and curving around the boats laden with timber, that crowded close together against the Zattere. The wind still blew with violence, and a little rain fell. The sky and the water were of the same leaden grey, and the sea-gulls flying between water and sky shone like white flakes of snow blown by the wind.

There is no city in Europe which contains so much silence as Venice, and the silence of the Giudecca is more lonely than any silence in Venice. Yet, by day and night, there are certain noises, which one learns to expect, becomes familiar with, and finds no distraction in: the roar of the sea, when there is wind on the sea-walls, a dull, continuous, enveloping sound, which seems unintelligible as one looks across at solid land on the other side of water; the loud and shaking violence of wind; the hoarse, echoing hoot and trumpeting of great black or red steamers, which pass slowly, or anchor almost under the windows, to take in stores from the granaries that stand locked and barred and as if empty, along the fondamenta; the deep splash of the oars of barges, as the men who push with long oars in the water set the oars against their row-locks and begin the heavy rowing; the thin plash of the one oar of gondolas; the guttural cries, from water and the narrow strip of land, all in thick vowels, clotted together without a consonant between; and the ceaseless busy flapping of water upon the steps and around hulls, with little noises never twice quite the same.

I saw Venice first by night, and I walked from the railway station to the Piazza alone, and without a map or guide-book, in order to come into the midst of the city as casually as possible, and so find out a few of its secrets by surprise. A place has almost the shyness of a person, with strangers; and its secret is not to be surprised by a too direct interrogation. I have spent weeks in the churches of Venice, climbing upon ladders, and propping myself against altars, and lying on my back on benches to look at pictures; and I have learnt many things about Tintoretto and Bellini and Carpaccio and Tiepolo which I could have learnt in no other way.

But what I have learnt about Venice, Venice as a person, has come to me more or less unconsciously, from living on the Zattere, where I could see the masts of ships and the black hulls of barges, whenever I looked out of my windows on the canal of the Giudecca.

Sweden and the War

By F. Henriksson, Author of *England in the World's War* (just published in Sweden)

Last week Mr. Henriksson reviewed the political situation in Sweden, from the beginning of the war until the formation of a Liberal-Social Democrat Ministry, with M. Nils Edén, Liberal, as Prime Minister, and M. Branting, the well-known Social Democrat, as Finance Minister. It is this Government that is now in power in Sweden. Both Liberals and Social Democrats are pro-Ally. It was the Conservatives who were pro-German, and at one time they received considerable support from the Court. Since the last General Election the King has maintained a strictly constitutional attitude; the sympathies of the Queen, a cousin of the Kaiser, continue with Germany, but there has been no active interference in public affairs—

STRONG attempts were made to prevent Branting from entering the Government on account of his outspoken Entente sympathies. He, himself, fully aware of the difficulties before him, was far from anxious to join the Ministry. But finally the leaders of the Left Parties had to take the logical consequences of the election and form a Liberal-Social-Democrat Executive, with the leader of the Liberal Party, Nils Edén, Professor of Modern History, as Prime Minister and Branting as Minister of Finance. The Foreign Minister is the Lord Chief Justice J. Hellner, a moderate Liberal, who was a member of the Swedish Trade delegation which a year ago for some months stayed in London for negotiations with the British Government. Another member of the new Government is the well-known Barrister Löfgren, who has visited London many times during the war and has been a most indefatigable advocate of an arrangement with England and a severe critic of the Hammarskjöld neutrality policy.

Circumstances accompanying the formation of the new Government demonstrate how the events during the war have taught their lesson. The King has shown wise insight into the forces shaping the future of the nations, and no irresponsible advisers have had power to interfere as they did in 1914. The "Pro-German" group has lost its power to make mischief and so has the German propaganda, although a few organs in the press, such as *Aftonbladet*, continue on their mad course. It is, however, to do them too much honour and to do the Swedish people injustice to give those papers—as has been done lately—prominence in the English Press as representing any responsible or noteworthy Swedish opinion. We hear now very little of Court influences, and Sven Hedin is silent.

From their utterances it is clear that the new Ministers are fully aware of the critical times, the difficulties before them, not least in regard to external relations. The inheritance from the Hammarskjöld administration has put the country in a position which has to be righted. The United States in the war alters the trade situation and the resultant sufferings of the population greatly for the worse, as America is master of its own produce, which the European Neutrals are in great want of, and needs no goods from them in exchange, but can demand as sole condition the stoppage of their export to Germany. Thus the United States as an important point in the tightening of the blockade aims at stopping Swedish iron ore to Germany. On the other hand, Germany uses the great bargaining power of coal, iron, potash, dye-stuffs, chemicals, etc., against the neutrals, who thus find themselves more and more pressed "between the devil and the deep sea." Furthermore German ironmasters own several iron mines in Sweden and have a running contract for ore from the Lapland mines entered into long before the war. How far the Swedish iron export to England is maintained, I cannot say, but the ex-Foreign Minister Lindman recently gave an exposition of Sweden's trade relations during the war, in which he said it was a mistake to believe in an enormous increase of the Swedish iron ore export to Germany during the war; instead, there was a decrease in 1916 of 679,000 tons compared with 1913.

Thus the Government are aware that new and extremely serious problems are ahead. There are mistakes in the past which cannot be undone and suspicions, accumulated during recent years, remain. But whatever else may occur, it cannot from the Entente side be maintained with any justification that the Swedish Government is animated by any mental inclination towards Germany or influenced by forces inducing them to such partiality, for whatever reasons, in their determination to uphold Sweden's neutrality. It would be a mistake to surmise that they could be prevailed upon to deviate from that resolution to guard their country's independence without which any nation would forfeit its right to existence.

A seemingly small matter in connection with the change of Government is worth notice. It is reported that the new Ministers made it a condition not to be under any obligation to receive or wear decorations or appear before the King in State uniform. It is a break with monarchic, bureaucratic and other traditions of the old order which in reality reflects a kind of peaceful revolution.

The new Premier's declaration of policy emphasises as the first task "to maintain, in accordance with the clearly expressed will of the people, unswerving and strictly impartial neutrality in all directions and a corresponding trade policy." This is more explicit in its definition than any previous similar declaration. It also lays stress on the further development of the co-operation between the three Scandinavian Kingdoms which the war gradually has brought about. As a matter of fact, the solidarity of the Scandinavian peoples and their external policy has not been brought home to them so strongly and with such a consolidating result since the time when Prussia, in her military ascendancy, dismembered Denmark. There are, of course, many divergent opinions and differing interests. But they concern essentially subordinate matters and do not disturb the conception of the larger unity of interests in the comity of nations which the war has impressed on the Scandinavian peoples.

The Food Situation

But as a natural consequence of the later development of the war, the greater part of the Government's declaration is concerned with the food situation in Sweden. Rationing is proceeding apace, and the outlook is very grave. There is a menace of famine in large parts of the country as famine is also creeping over the neighbouring Finland. Besides, there is an increasing shortage of such commodities as paraffin, candles, gas, etc., necessities of vital importance in those northern countries during the long dark winter. Schools and other institutions in parts of the country are likely to be closed on this account. There are public collections of candles for schools and for the poor; at the head of one of them is the Crown Princess Margaret. The whole town of Mahmö, with 100,000 inhabitants, received as its share for October, only 125 candles from the central rationing commission. The shortage of coal has compelled the authorities to extensive restrictions of railway services and to adapt engines for burning peat. Several industries are gradually closing down to a great extent.

With the German successes in the Baltic a new problem seems to replace the Russian menace, which has disappeared in the wave of dissolution in that country. The new problem of danger is German domination in the Baltic and on the eastern Baltic shores. The same chauvinistic opinion which earlier endeavoured to vindicate the German cause, now begins to express apprehension. Certain papers have lately said that a German domination of the Aland Islands might be a menace to Sweden just as the Russian domination. The Baltic was once a "Swedish lake," and from that time it has lived in the imagination of the people, stimulated by song and saga, as Swedish water. That explains greatly the effect in the mind of the people of other and mightier Powers ruling that sea far out in which lies the Swedish island of Gothland, the "pearl of the Baltic," full of Swedish memories from oldest times.

Finally, the Stockholm Conference which has had such prominent place in the public eye, should be mentioned. As a matter of fact, it practically played no part in Swedish politics. It was scarcely touched upon in the Election speeches. Except for the general intense longing for peace and as a possible help to attain peace, the conference apparently caused comparatively little interest in Sweden. Whether its intellectual home was in Germany, and whether from there it was originally grafted on some Dutch or Danish Socialists, as has been asserted, I do not know. But the fact that Branting accepted the chairmanship of the Conference should be sufficient evidence of its *bona-fide* as far as he conceived the aim of that conference. Branting again is a champion for that organisation of international relations, those means of settling international conflicts, those guarantees against war and domination of militarism and bureaucratic despotism, those rights of nationalities and peoples, which President Wilson and leading British Statesmen so eloquently have described as their aim in the war. It was because he conceived and still conceives that the re-establishment of the co-operation of labour in different countries on a broader basis than the old international is necessary as a means to this end, that he laboured for the Stockholm Conference.

After-the-War Work*

By T. H. Penson

NOBODY will dispute the fact that after the war the economic condition of the country will demand the most serious consideration. Every war involves a great expenditure of men and money, the destruction on a very large scale of material wealth, increase of national indebtedness, and general dislocation of industry and trade, and this has proved very specially the case in this the greatest of all wars of ancient or modern times. Reference is constantly being made to the state of things which prevailed in this country after the great wars with France, 1793-1815, and it is thought by many that the economic distress of the years 1815-1820 is likely to occur again at the close of the present struggle. The comparison, however, is not so close as some would think, and there seems little reason to believe that history will repeat itself with any exactness of detail. Now, as was then the case, there is bound to be financial exhaustion and, owing to the disbandment of armies and the cessation of war industries and employments, serious disturbance of the labour market.

But England is in a very different position industrially from what it was a century ago. At that time England was passing through the economic changes generally known as the Industrial Revolution. Everything was in a state of transition. Agriculture was giving place to manufactures, and the factory system was being rapidly extended. Population was increasing at an abnormal rate, and people were shifting from the country to the towns. Poverty and pauperism were widespread, and the condition of the labouring classes generally was deplorable. The peace which followed Waterloo meant not a return to pre-war conditions, but an aggravation of the distress which had been occasioned by the changes going on during the war.

Good Organisation

At the end of the present struggle there will be many difficulties to adjust and many problems to solve—but they will not be those of 1815. The industrial system, however imperfect it may be, has now reached a high stage of development. The wage-earning classes are well organised; they occupy a better social and economic position, and they represent a powerful force both in industry and in politics. When peace is restored there will be much to readjust, much to reconstruct, and much to abandon altogether. It will be the opening of a new chapter in the social and economic life of the country, with infinite possibilities and, it may be added, infinite promise.

There is one consideration, however, which is fundamental to the realisation of the various schemes for the material improvement of the condition of what are generally described as the working classes. The present struggle has been more costly than any that has preceded it. The War Bill has been steadily mounting up and now exceeds eight millions a day. As this amount is far in excess of the wealth that is being produced, it is obvious that we have been using up wealth previously accumulated, and at the same time mortgaging heavily wealth to be produced in the future; and further, the war has involved to some extent the destruction of those factors which are essential to the production of wealth—labour power, fixed capital, means of transport, etc. All the belligerent Powers will emerge from the war both poorer and less well equipped for wealth production than they were in the middle of 1914. The poverty of other countries cannot fail to exercise an important effect on the development of our own industry and trade, which is a fact which cannot be ignored. But it is sufficient for the present purpose to concentrate our attention on the mere question of wealth production, and to take as our main proposition the fact that after the war England will be far less wealthy and far less well provided with the means of producing or obtaining wealth than she has been for many years past.

What is going to be done to remedy this state of things? Is it sufficiently realised that just as during the war we have as a nation had to make an unprecedented effort and unprecedented sacrifices, so for some years after the war we shall as a nation have to make further effort and further sacrifices, though of another character, if we are to replace the wealth that has been destroyed, and to restore to a condition of efficiency the productive forces which have been so seriously impaired. The solution of labour problems is closely bound

up with the possibility of raising the standard of living of the workers. The raising of the standard of living presupposes a corresponding production of wealth.

Economic Difficulties

The economic difficulties which may be expected to result from the long period of war are well recognised in Germany. German manufacturers and artisans, farmers and peasants, traders, financiers, shipowners, and men of science, have but one idea in their minds—that they must devote their utmost energies and all their available resources to replacing their lost wealth, to regaining their lost trade, to repairing their damaged industrial fabric. The national determination is well expressed in a letter found on a German prisoner: "When the war is over, oh, how we will work!" It is by hard work, by the putting forth of their utmost effort, that the Germans expect and intend to recover from the disastrous economic effects of the war and to build up renewed prosperity in the shortest possible time.

Is this the resolution also of the people of this country? Is it realised here also that work is the only avenue to recovery? We have, it is true, one great advantage over Germany, inasmuch as her overseas trade has been cut off altogether, while ours, though it has suffered somewhat from shortage of shipping, from credit restriction, and from war conditions generally, remains essentially untouched. But we have the same need as they have to meet the industrial, financial and commercial disabilities created by the war with the resolute determination to work—to work long and to work hard—in order to build up again the national prosperity. And in this work of rebuilding all must take a part. The task is not reserved for one section only of the community. High and low, rich and poor must all unite in this great national undertaking. There must be no buried talents, no forces left unemployed.

Are there any signs that this necessity for work is as fully recognised as it should be? Is there not, on the contrary, a fairly widespread feeling that the war has been a period of strenuous activity and of special effort, and that when it is over we deserve a period of comparative slackness distinguished by short hours, easy conditions and good pay? The recent demand for a thirty-hours week—six hours a day for five days with Saturday and Sunday off—seems to lend support to such an idea; but what a disastrous policy! It is like answering the German "Oh, how we will work!" with, "Let us do as little work as possible!" It is probable that the authors of the thirty-hours week programme would have been the last to approve of a general relaxation of effort such as is here suggested, and that in their anxiety to avoid the evils of unemployment which inevitably accompany disbandment of large numbers of men from the army or from occupations otherwise connected with the war, they have put forward a scheme which by limiting the amount of work to be done by each would secure occupation for the largest possible number. This, however, would necessarily result in limiting the total amount of the product and is nothing more than the old familiar economic fallacy of the "Work Fund." This assumes that there is only a certain amount of work to be done, and that in order to employ everybody, only a very limited quantity must be given out to each. Such a policy has always had the most unfortunate results, but if it were applied after the war the consequence to the economic welfare of this country would be absolutely disastrous.

When a man finds that his larder is getting empty, the remedy is more work, not less work; and similarly when a nation urgently needs to rebuild its material prosperity, hard work, intelligent work, persistent work, is the only sure means to the end. If every man were engaged in producing the food, clothing, etc., that were needed for the satisfaction of the wants of his household, the folly of the thirty-hours week would at once become apparent. He would learn by sad experience that by working less he would get less. But as he produces goods for other people's consumption, himself receiving a weekly wage, the connection between the actual results of his labour and the food, clothing, etc., which go to make up his real wage, is only too often lost sight of.

The fundamental fact is that wealth must be produced before it can be consumed, and to increase money wages to £5, or even £50 a week would not in any way benefit the receivers unless as the result of their efforts the wealth was produced which they are desirous of consuming. The increase of the demand for commodities in general, combined with the shortage of supply, would only lead to gradually

* This article was already in print before the debate in the House of Lords of November 7. The speeches then made afford full justification, if any be needed, for the stress here laid on the necessity of increased wealth production after the war.

increased prices, and thus the wages would go no further than before.

A certain amount of unemployment after a war is, as has been already said, an inevitable evil. This is partly due to the fact that the demand for any particular kind of skilled labour does not necessarily increase just when the supply of that particular labour has become suddenly augmented. The more rigid the lines of demarcation between different trades and occupations, the more difficult it is to adjust the supply to the demand. In a purely agricultural country the disbandment of an army causes no difficulties of this kind. Food is needed, and all can be turned on to the production of food. Similarly, if every factory worker could work equally well in any type of factory, the problem of unemployment would become a fairly simple one.

It must not be supposed that because objection has been taken to the introduction of a thirty-hours week as the standard or ideal to which all labour should tend to conform, there may not be occasions when work is temporarily more or less a fixed quantity and when consequently it may be a wise policy to distribute work more evenly by reducing appreciably the number of hours worked per week. This has often been the case, for example in the cotton industry, where owing to temporary shortage of raw material, it has been found necessary to reduce the output of the mills all round, which can most conveniently be done by closing the mills on certain days. This, however, is an expedient only to be resorted to when under special circumstances production is compulsorily diminished. It would be a very bad system to adopt as a general rule at a time when the whole object should be to increase production to the utmost. And even if a thirty-hours week were introduced to meet a special emergency, such as the reorganisation of industry after a great war, there is always the tendency to look upon the shorter week as a normal state of things and to regard as a grievance, or even as an injustice, the return to a longer working week when, at a later date, industry has returned to more ordinary conditions.

Diminishing Output

Restriction of work all round diminishes output—diminishes in fact, the production of wealth which it is a vital necessity to promote if

- (1) The present standard of living is not to be lowered.
- (2) We are to retain our position in our own markets and in those of the world.

The standard of living of some sections of the community has during the war been exceptionally high in spite of the increased prices of commodities in general. It is hardly likely that in time of peace such incomes as, for example, those now being obtained by people engaged in munition work will represent the ordinary wages of labour, and it may be taken for granted that when these workers return to their normal occupations, there will be a much smaller margin for luxuries than at present. At the same time, it may safely be said that taking the workers as a whole, there will be a demand for considerably higher rates of wages than those which prevailed prior to the war. But how, it may be asked, can so largely increased a wages bill be met? Many are prepared to answer promptly, "Out of profits," but this, as the Labour Leaders are themselves fully aware, is by no means a complete answer to the question.

It is true, no doubt, that in some undertakings, and possibly also in some entire industries, the margin of profit calculated over a sufficiently long period to allow for ups and downs of trade is sufficient to admit of an increase of wages, but in such cases the increase would probably fall far short of the workers' demands. In all the more highly organised industries Trade Union action is by means of collective bargaining able to secure the highest rate that the trade will afford.

The real source of wages is the value of the work done. If this is increased wages can be raised, if not, no such rise is possible. The value of the work done may be increased in three ways:

- (1) Improved methods of production resulting in greater quantity and quality of output.
- (2) Greater skill or greater industry on the part of those engaged in the work.
- (3) A higher price obtained for the article produced or for the service rendered.

The last of these is merely obtaining an advantage for one set of workers at the expense of the rest of the community, and from a social point of view could only be justified if that particular kind of labour—having due regard to conditions of work, skill required, expense of training, etc.—were less well remunerated than other work with which it may be compared.

It is on the two former that we must rely for any appreciable increase in wages as a whole. Ingenuity, invention,

scientific progress, enterprise, the introduction on a large scale of labour saving appliances, the well directed use of all our powers both intellectual and physical will secure an increased production of wealth, and of this increase all who have contributed to it may well demand their share.

Increased Production

That after-the-war production must be increased rather than diminished can hardly be questioned. The necessity to restore the economic strength of the country, to replace the wealth that has been destroyed during the war and to secure the conditions of material improvement in the future, can hardly be disputed. But how is this to be accomplished? The object is national as well as personal and this seems to justify the placing of the industrial question on an entirely new footing. If men are to work for national ends they must be persuaded of the necessity and advantage of such work and their co-operation in it will then be whole-hearted and efficient.

The present relations of capital and labour seldom admit of the wage-earners taking a real interest in, or feeling a proper responsibility for the work in which they are engaged. It is not to be wondered at, therefore, that demands made as to wages, as to hours and other conditions of work should be at times altogether unreasonable. They know very little of the conditions under which their work is carried on. They know probably nothing of the difficulties of obtaining raw material, of finding markets, and of competing with rivals. This state of things must necessarily be altered if workpeople generally are to play the part that is expected of them in the coming economic struggle. As it is well expressed in the recent report of the committee of which Mr. J. H. Whitley, M.P., the Deputy Speaker, is chairman:

In the interests of the community it is vital that after the war co-operation of all classes, established during the war, should continue, and more especially with regard to the relations between employers and employed. For securing improvement in the latter, it is essential that any proposals put forward should offer to workpeople the means of attaining improved conditions of employment and a higher standard of comfort generally, and involve the enlistment of their active and continuous co-operation in the promotion of industry.

The report goes on to recommend the formation of joint standing Industrial Councils composed of representatives of employers and employed. These councils would, amongst other things, "settle the general principles concerning the conditions of employment, including the methods of fixing, paying, and readjusting wages, having regard to the need for securing to the workpeople a share in the increased prosperity of the industry." This seems to be a move in the right direction. When the workers have a voice in settling the conditions under which they work, and when they feel sure that they are personally and directly interested in the work on which they are engaged, there is no reason to doubt that the necessity for the most strenuous effort after the war will be clearly recognised by them, and that they will not fail to take a full share in this great national struggle for economic stability and commercial predominance.

At a meeting of the Feminists' Union held last month at Budapest in support of women's suffrage, according to the *Pester Lloyd*, the deputy Canon Giesswein urged that this reform would do away with the monstrosity of a double standard of morals, and politics would be based on pure humanity. Dr. Rath said that women had amply proved their right to the vote by war-work of all kinds. Dr. Katona declared that civilisation could everywhere be measured by the degree in which all inhabitants shared the material and moral possessions of a country. Women's suffrage, both active and passive, was indispensable. Madame Lamberger moved a vote of confidence in the Government, and demanded that women's suffrage should not be regarded as a party question, but as an important part of the democratic reforms with which urgent social questions were bound up.

Commenting on the entry into the war of the South American States, the *Hamburger Freudenblatt* writes: It has now gone so far, that countries which up till now have been neutral, and to which Germany has not done the slightest wrong, have ranged themselves on the side of our enemies, without even the customary forms of courtesy. Of course, this has happened not from a voluntary decision on their part, but in consequence of the pressure which the Entente has put on their Governments. On account of the enormous distance between these small States and Germany, they run no danger of coming into actual conflict with Germany. Hence for the present, their breach with us has no direct consequence for them, and so they yielded to the pressure of the Entente without any serious resistance. Probably they will also allow without protest—as Peru, for example, has already done by seizing German ships lying in Peruvian harbours—that the expropriation campaign against German world commerce be extended to their lands. Apart from that the whole pressure of the Entente on these small lands has scarcely any meaning. What President Wilson and his Allies are aiming at, is the radical and rapid destruction of our economic world interests.

LIFE'S HORIZON.

THE opportunities of the future for those who save are many. Do not spend all you earn. Save as much as you can week by week. Save for your children's education. Give them the right start in life. This is not preaching—it is sound common sense. Invest your money where it will grow and help your country at the same time. Buy Government securities—War Savings Certificates are ideal. Each 15/6 becomes £1 in five years, and you can get your money whenever you want it, or if you prefer them—buy National War Bonds. To do without *trifles* now will mean that you can buy *useful* things in the future.

ISSUED BY THE NATIONAL WAR SAVINGS COMMITTEE,
(Appointed by His Majesty's Treasury)
Salisbury Square, London, E.C. 4.

Wallcousins

For Officers on Active Service

A Much-Appreciated Xmas Gift

—and not expensive.

ONE of the chief anxieties of Officers on Active Service, abroad, particularly those in the more distant Theatres of War, is to keep themselves in touch with Home News and with the happenings on the various Fronts. Their interest in Home Affairs and in the Progress of the War is sharpened by the very fact that they are so far removed from the heart of things—London.

To them The Times Weekly Edition comes as an unspeakable boon. It contains just what they want. Printed in clear type; of a size convenient for holding and folding, and packed from cover to cover with news of every kind, and with the cream of The Times' Leaders and Special Articles

The Times Weekly Edition keeps its readers abreast of the War, abreast of Home and Foreign Intelligence, Politics,

Finance, and Commerce; in short, it presents in a most readable form

A Bird's-eye View of the World's History for the Week.

The services of The Times Supply Agency are at the disposal of every reader of The Times Weekly Edition. By personal service, this Agency enables Overseas readers to purchase from the British market as advantageously as though living in London.

Life and Letters

By J. C. Squire

Keats's Fame

A HUNDRED years ago Keats's first volume of poetry was published; and Sir Sidney Colvin's new *Life* (Macmillan, 18s. net), which, humanly speaking, must be the definitive biography of the poet, is a "centenary tribute," which renders any other unnecessary. That first volume, which appeared when Keats was twenty-one, contained, as every critic has observed, much immature and much bad work. Lines like

Of him whose name to ev'ry heart's a solace
High-minded and unbending William Wallace,

which Sir Sidney Colvin does *not* quote, beat on their own ground Leigh Hunt's

The two divinest things the world has got
A lovely woman in a rural spot,

which he does quote. But when everything possible has been extracted to illustrate the tremendous progress Keats made in two years, the fact remains that there were scattered everywhere in the book, passages which might have shown any one but a dolt that this was a great poet in the making, and that it contained, moreover, *To One who has been long in city pent: Sleep and Poetry*, and, above all, the Sonnet on Chapman's *Homer*.

* * * * *

The reception that it got is notorious. "The book," says Cowden Clarke, "might have emerged in Timbuctoo with far stronger chance of fame and appreciation. The whole community as if by compact, seemed determined to know nothing about it." This is a slight exaggeration. There was a little sale; and this is how the publisher alludes to it:

By far the greater number of persons who have purchased it from us have found fault with it in such plain terms, that we have in many cases offered to take it back rather than be annoyed with the ridicule which has, time after time, been showered upon it. In fact, it was only on Saturday last that we were under the mortification of having our own opinion of its merits flatly contradicted by a gentleman, who told us he considered it "no better than a take-in."

The critics, however, said little about it (except that Keats was unclean); their efforts were reserved for *Endymion*, which came out next year. With this the friends of "that amiable but infatuated young bardling, Mister John Keats," could no longer complain that he was entirely ignored. *Blackwood* led the pack, the *Quarterly* and the *British Critic* following. Here is *Blackwood's* peroration:

And now, good morrow to the "Muses' son of Promise"; as for the feats he yet "may do," as we do not pretend to say like himself, "Muse of my native land am I inspired," we shall adhere to the safe old rule of *pauca verba*. We venture to make one small prophesy, that his bookseller will not a second time venture £50 upon anything he can write. It is a better and a wiser thing to be a starved apothecary than a starved poet: so back to the shop Mr. John, back to "plasters, pills, and ointment boxes," etc. But, for Heaven's sake, young Sangrado, be a little more sparing of extenuatives and soporifics in your practice than you have been in your poetry.

This passage is well known. What is not so generally realised is the slowness with which the appreciation of him spread even after his death. He had died, and Shelley's great elegy on him was under review, when *Blackwood* resumed with a reference to him as

a young man who had left a decent calling for the melancholy trade of Cockney-poetry and has lately died of a consumption after having written two or three little books of verse much neglected by the public.

A comic analysis of *Adonais*, with parodies on it followed. A few men knew what Keats was: Lamb, Shelley, Leigh Hunt and Keats's young friends. Reynolds, in a later letter, said: "He had the greatest power of poetry in him, of any one since Shakespeare." Eight years after his death a group of young Cambridge men, including Tennyson, Fitzgerald, Sterling, Arthur Hallam and Monckton Milnes—Browning, as a boy, had already been inspired by him—were the first group of enthusiasts who had not known him in the flesh. But the pundits still remained secure in their crassness. It was in 1832 that the *Quarterly*, reviewing Tennyson's poems, wrote of him as

a new prodigy of genius—another and brighter star of a galaxy, or *milky way* of poetry, of which the lamented Keats was the harbinger.

Jeers at Keats's failure with the public were still well-founded in fact. Keats had been dead nineteen years when the first

reprint of his collected poems appeared; and this went into remainders with Browning's *Bells and Pomegranates*. Four years after this Lord Jeffrey, still flourishing, observed that Keats and Shelley were falling into oblivion, and that of the poets of their age, Campbell and Rogers were those destined for immortality. Lord Houghton's edition of 1848 marks the date of the general recognition of Keats as one of the greatest of our poets. The maintenance and increase of his fame since then cannot be described in detail. "Keats," said Tennyson, "would have become one of the very greatest of all poets had he lived. At the time of his death there was apparently no sign of exhaustion or having written himself out; his keen poetical instinct was in full process of development at the time. Each new effort was a steady advance on that which had gone before. With all Shelley's splendid imagery and colour, I find a sort of *tenuity* in his poetry." Again, "Keats, with his high spiritual vision, would have been, if he had lived, the greatest of us." And the noblest tribute of all is the Essay by the present Poet Laureate, indisputably the finest thing that has been written about him, and one of the most penetrating, direct and—there is no other word—business-like critical studies in existence. "H." concludes that essay,

if I have read him rightly, he would be pleased, could he see it, at the universal recognition of his genius, and the utter rout of its traducers; but much more moved, stirred he would be to the depth of his great nature to know that he was understood, and that for the nobility of his character his name was loved and esteemed.

And the words are all the more impressive as they end a study which is utterly unsparring in its detection and analysis of Keats's faults.

* * * * *

"High spiritual vision," "the nobility of his character"; the phrases will still sound strange to those who take their conception of Keats from erroneous but hard-dying legend. He died of consumption; he wrote, when dying, love-letters which in places are morbid, though they are not, as a whole, so "deplorable" as is usually made out; and Byron gave universal currency to the delusion that he was killed by hostile criticism. This combination of facts has perpetuated the notion that he was a neurotic weakling with a hectic genius. It is all hopelessly wrong. Those who knew him thought him the manliest of men. Anecdotes like that of his hour's successful fight with a butcher twice his size whom he had caught ill-treating a cat, are unnecessary as corroboration: for corroboration is present everywhere in his letters, and frequently in his poems. A man who was killed by scurrilous blockheads of reviewers *would* be a weakling. But—except for the fact that attacks on him made it impossible to earn money by his poetry—he was indifferent to what was said about him. Every great poet knows his own capabilities; and Keats's opinion of those who were vilifying him was briefly expressed: "This is a mere matter of the moment; I think I shall be among the English Poets after my death." He was not *over* confident. He discriminated between his good and his bad work: "My ideas with respect to it" (that is, *Endymion*) he said, "are very low"; and, a little later, "I am three and twenty with little knowledge, and middling intellect. It is true that in the height of enthusiasm I have been cheated into some fine passages; but that is not the thing." But the only thing he was uncertain about was whether he had done anything good enough to show what was in him:

If I should die, said I to myself, I have left no immortal work behind me—nothing to make my friends proud of my memory—but I have loved the principle of beauty in all things, and if I had time I would have made myself remembered.

Of that he was never doubtful. And he knew accurately the conflicting but not irreconcilable tendencies within himself; the tendency to luxuriate and the tendency to "philosophise." At the beginning the former predominated. He wandered, often led by the rhyme, through mazes of soft and luscious imagery; he held that the greatest poet was he who said the most "heart-easing" things; and the list of his favourite adjectives, compiled by Mr. Bridges, illustrates very strikingly the languorous quality of his dreams and desires. But he was not made to be a slave to these: in the *Odes* and *Hyperion*, the richness and vividness and sweetness remained, but the tropical luxuriance had been pruned, and the native strength of his character and intellect, the clarity of his imagination, the absolute accuracy of phraseology of which he was capable, appear with a splendour that makes these poems incomparable

with everything else in our literature but the greatest passages of Shakespeare and Milton. "I think," he said, "poetry should surprise by a fine excess, and not by singularity; it should strike the reader as a wording of his own highest thoughts, and appear almost a remembrance."

* * * * *

I have not quoted Keats; I have barely referred to a few of his poems; I have made no attempt to discover the secret of his greatness or expose the beauties of his art. In a space like this, one is forced to fasten on one or two details only when dealing with so great a writer as Keats and so exhaustive a biography as Sir Sidney Colvin's. The structure and peculiar merits of Sir Sidney's volume one must also ignore. But all the material one could ask for is here; the poet's art and thought are very fully illustrated from his own words; there are several important additions to our knowledge of him; and the long critical chapters, especially those on *Endymion* and *Isabella* are as exhaustive and sensible as they are unaffected. This article cannot be called a review; but I hope that it will be taken as an unqualified recommendation.

Books of the Week

The Dwelling Place of Light. By WINSTON CHURCHILL. Macmillan. 6s. net.

Rustic Sounds, and Other Studies in Literature and Natural History. By SIR FRANCIS DARWIN, T.R.S. John Murray. 6s. net.

Turgenev. By EDWARD GARNETT, with a foreword by JOSEPH CONRAD. Collins. 6s. net.

The Challenge to Sirius. By SHEILA KAYE-SMITH. Nisbet. 6s. net.

THROUGH *The Dwelling Place of Light* runs a dual motive. It is the story of Janet Bumpus, a New England girl of good parentage living almost in slum conditions, and dissatisfied with her life, so much so that she yields after certain reluctances to the advances of the manager of the mill at which she is employed, and agrees to marry him—incidentally she falls in love with him in the process of yielding. The life of a New England mill town is pictured with all the attention to detail and fidelity that is characteristic of Mr. Churchill's work, and the strike which wrecks Janet's life is as realistic as anything in *Richard Carvel*, which is saying a good deal. Syndicalism and the madness of it, as opposed to capitalism, are shown as an evil; workers and employers alike lack the detachment and sanity with which their problems should be approached, and that sanity is supplied by one Brooks Insall, a writer who surveys and criticises, in kindly fashion, the devastation wrought by the warring interests.

This, however, is merely the material side of the book; its chief significance lies in the spiritual development of Janet, her struggles to reach "the dwelling place of light," and her fall by the way. From the beginning of the work tragedy is inevitable, for Janet is of those born before their time, one who asks of life more than conditions will allow. The critical reader may detect a false note in the account of her ultimate fate, as if the author had loaded the dice against her before making this last cast, but she stands as a specimen of a type that appears in increasing numbers, as arresting and stimulating a conception as any that this author has given.

* * * * *

Rustic Sounds and Other Studies, by Sir Francis Darwin, is a book to which the term "ripeness" is peculiarly applicable. It is the work of a man of many sympathies, one able to see beauty in the common things of life, a student of his kind, and, apparently, possessed by an infinite curiosity which led him to intimate knowledge with such diverse subjects as Stephen Hales, the "father of English botany"; the pipe and tabor, concerning which he delivered a most instructive address to a Society of Morris-dancers—and reproduced it in this book; Jane Austen, whom, though he appreciates, he criticises as well, and the criticism is illuminating. Throughout all these essays runs a vein of quiet humour; for instance, in *The Teaching of Science* comes the remark—"A class of experimentalists exists from whom we all suffer—namely, cooks." The illustration, at first sight, is hardly fitting in a disquisition on how science should be taught, but on second thought it is eminently fitting.

Possibly the study, *Rustic Sounds*, which gives a title to the book, will give pleasure to the majority of its readers in greater degree than the rest of the contents, for there is in it a keen appreciation of the music of the countryside, and an evident love of nature that has not blunted the sense of criticism. "The greenfinch is a pleasant singer, or perhaps a conversationalist," says the author—and how many who have listened to this bird would think to settle his place in one phrase after this manner? And the green woodpecker "goes through life laughing, but I am not sure that I should like his taste in jokes." These are little things that bespeak the quality of the work, and they are sufficient to assure the reader that on a winter's night, with a good fire, he could find many worse companions than this book.

* * * * *

Certain sentences of Turgenev's, in Mr. Edward Garnett's appreciation, *Turgenev* (Collins, 6s. net), bespeak the genius of the great Russian. For instance, "If you analyse your sufferings you will not suffer so much," and the famous letter to Tolstoy. But, for Mr. Garnett's own part in this book, he doth protest too much, so that his work is neither a sketch of Turgenev's life—save for passages in a couple of chapters nor an analysis of his work, but merely a eulogy. And Turgenev, more human than Dostoevsky, saner than Tolstoy, a reformer in a better sense than Gorki, and more of an artist than any other Russian writer, needed no such panegyrics.

But Mr. Joseph Conrad has written a foreword, and for the sake of that foreword the book should command attention. In a matter of five pages Conrad has spoken of "that fortunate artist who has found so much in life for us and no doubt for himself, with the exception of bare justice," in such a way that one sees Turgenev, and is grateful to Conrad for the vivid portrait. Mr. Garnett's study, to hedge a little, will be of value to those who do not know Turgenev's work and who need that somebody should point out to them its excellences, though for that it is better to read Garnett's introductions to the collected edition of Turgenev's works.

Conrad sums up in a sentence the reason why Dostoevsky and his kind are the popular Russian writers in this country, in preference to Turgenev. "If you had Antinous himself in a booth of the world's fair, and killed yourself in protesting that his soul was as perfect as his body, you wouldn't get one per cent. of the crowd struggling next door for a sight of the Double-headed Nightingale or of some weak-kneed giant grinning through a horse collar." Mr. Garnett has tried to express this in many pages; Conrad's foreword in its entirety is a brilliant summary of Turgenev's value to the world.

* * * * *

Having won for herself a distinctive place as a writer of south-country people and their surroundings, Miss Sheila Kaye-Smith, in her latest book, *The Challenge to Sirius*, moves her story farther afield. Frank Rainger, the central figure, grows up beside a village maiden in the Isle of Oxney on the Kent and Sussex border, but roams half across the world, sharing in the American civil war and seeing the dead cities of Yucatan before life drives him back to Oxney. He travels the full circle of life and, on his return to Maggie, the best of his years have gone, but Maggie, type of the earth that bore her, is constant, and her man does not come back in vain.

One may thus outline the whole of the story, since it is a book in which the plot is of small account. It is in the word-painting, which this author accomplishes as few can, that the chief charm of the book lies; dawn in Oxney, the half-starved army of the Confederacy, Vicksburg in the last days of the defence, Yucatan as Rainger found and experienced it—these things are shown so vividly that the reader cannot fail to realise them, while the story of Lorena, in the book's latter part, is poignantly beautiful—Lorena herself is an arresting creation. Six novels out of ten show talent, and perhaps one in a score betrays genius on the part of the author; here is one in which genius is plainly evident, caviare to the crowd, perhaps, but work of an unusually high order.

Copies of "The British Firing Line Portfolio," containing a series of Engravings in Colour by Captain Handley-Read and forming a wonderful record of the Battle-area, may be obtained, price 5 guineas each, from the Leicester Galleries, Leicester Square, W.

The War in Palestine

At the Gate of Beersheba

Bridge over a Wadi near Gaza

"Land & Water"—a wrist-watch worthy of its makers' reputation

For men in the Naval, Military, or Air Services—for active, energetic civilians—in fact, for all requiring a wrist-watch to stand exceptionally hard, rough usage, or varying climatic conditions, there is only one watch—"Land and Water."

The fact that the "Land and Water" wrist-watch carries the guarantee of a British firm with over a century's reputation, that it can be regulated never to lose or gain more than two minutes per month, or roughly, at the most four seconds per day, under all conditions, is in itself a wonderful tribute to the watch. But, in addition, the "Land and Water" wrist-watch has the advantage of being dust and damp proof. The movement is fully jewelled and fitted with Micro-meter Regulator to give fine adjustment, while the watch is adjusted and compensated for all positions and temperatures.

Actual tests have proved it equal to a 40 guinea Chronometer. It stands all the shocks, jars, and strains to which a wrist-watch is subject under severe Service conditions.

It is fitted with unbreakable glass, thus rendering dial protectors unnecessary, and the luminous hands and figures are far more brilliant and durable than the usual.

The "Land and Water" Wrist Watch, with unbreakable glass and luminous dial - - - £5 0 0
9-cl. Gold Model, white dial only - - - £10 5 0

Steel Wristlet (as illustrated), self-adjustable. Fits all wrists—slender or stout. No straps, buckles, or other inconveniences. Enables the watch to be slipped up the arm at wash-time, or turned face downwards, thus doing away with dial protectors. Strong and durable.

Nickel-plated, 2/3. Silver plated, 2.9. Gold-plated, 5/5.

Steel Wristlet extra.

Dried Whole Eggs

The high price of eggs—new laid and otherwise—gives the housekeeper furiously to think. Economy can certainly be worked in the egg direction by using Egall, a most convenient proposition. Egall is guaranteed to be the pure dried whole egg, the way it is presented being a particularly adroit one. Inside the box are twelve little packets each containing one dried egg, so that measuring is easy. Directions are printed on every one, it being made plain that the contents should be dissolved in lukewarm water. It is best to let this stand for at least three hours. The box with the twelve packets complete costs but 1s. 7d., a price at which one has been unable to buy a dozen eggs for many a long day.

Nobody claims that a dried egg is the equivalent of a new-laid one in actual taste, but nevertheless Egall can be used in cooking most aptly just now. An analyst's report is printed just inside the lid, proving not only that Egall is the genuine shell egg but also that it possesses the same food value. Egall in fact is but an egg with water evaporated, and these one egg packets may be regarded as such. When used they want careful handling, but if this is done successfully they will be a success and also an undoubted help to the resources of the household.

Some Exceptional Cornflour

Nothing but praise can fall to the lot of some remarkably excellent cornflour. Like many other good things, it is prepared in Scotland specially for the London firm now selling it. Cornflour is such a valuable and still such a comparatively cheap article of food that it is odd it is not used far more often than it is. Like everything else it has of course greatly increased in price, but even allowing for this it remains a relatively inexpensive food, with far more food value than a host of other more costly products.

To get the full benefit of this particular cornflour it should be boiled from eight to ten minutes. Then its delicious flavour is properly produced. When it has been boiled long enough it will, when poured out, leave the saucepan practically clean. Great care should be taken that the precise quantities mentioned in the various receipts are used and the other directions carefully followed. Then the cornflour has its full chance, and will show what cornflour at its very best can be.

As to price it costs ninepence a lb. packet, 2s. 4d. for a three and a half lb. bag and 3s. 3d. for a four lb. tin.

Scotch Gauntlet Gloves

The prospect of cold weather makes some really deliciously warm gloves particularly inviting. There are some woollen gauntlet gloves of quite superlative yarn. Soft to a degree, they represent a class of thing indeed, of which the future supply, owing to prevailing conditions, is problematical and their securing now imperative.

These woollen gloves, though obviously worth a good deal more, are being sold at the particularly attractive price of 3s. 11d. In all sizes, some of their colourings are quite remarkably beautiful, and bright though they are they would never come amiss for country wear. The reason why those concerned can offer them so cheaply to-day is a tale soon told. They represent some far-sighted buying some months ago—buying of which the shopping public are reaping the advantage to-day. Once this present stock is disposed of, the gloves (even if they could be got at all—always a question now) must undoubtedly enormously soar in price.

The same people also have a splendid collection of furlined gloves, besides some wonderful gloves which will literally last six or seven years, so durable are they. Made of goat-skin lined with lambswool, they can be bought for 14s. 11d., money which obviously could hardly be better laid out in the winter glove way.

PASSE-PARTOUT

The War Hospitals Supply Association, which is a branch of the Queen Mary's Needlework Guild, is established under the presidency of Countess Fitzwilliam at 4, Grosvenor Square. Its success is due to the energy of its indefatigable Committee, and the work which it carries on so effectively and thoroughly is deserving of public support. By permission of the Hon. Lady Ward, a Bridge Tournament is to be held at Dudley House, Park Lane, on Saturday, November 17th. Applications for tables (two guineas each) should be made to the Secretary, War Hospital Supply Workers, 4, Grosvenor Square, W.1.

WINTRY WEATHER

Hot OXO is an inestimable boon to the fighting forces at this time of the year.

It aids and increases nutrition; it stimulates and builds up strength to resist climatic changes, and is invaluable for all who have to undergo exertion either to promote fitness or to recuperate after fatigue.

OXO takes up little space, is easily carried, and can be converted quickly into a hot nourishing drink which, with bread or biscuits, will sustain for hours.

Be sure to send **OXO**

OUR TRUE POLICY

THERE is some danger lest we at home should lose our sense of proportion in the matter of last week's excursions and alarms.

Even after more than three years of war the political habits of peace are not wholly forgotten, and the idea that civilian debate is in some way the chief national business is difficult to eradicate. That is the impression one gathers when one contrasts the emphasis which our press has laid upon Monday's debate in the House of Commons, and the still greater emphasis which was laid upon the events which led up to that debate. The truth is—and a very few weeks or days will make it apparent—that none of these things, not even the proposal to institute a new form of International Council, are in any way upon a par with the enormous business of the war; and we civilians shall be doing a real service if we regard all political discussion as trifling compared with the actual struggle for the future of England, which still has for its theatre, and will continue to have, not council rooms in London, not even in Versailles, but the plains of Flanders.

Briefly, what happened was this: The political chiefs of the Western nations and certain of the military advisers foregathered after the recent Italian disaster and decided upon the formation of a new International War Council. The formation of this Council was announced in very vague and even misleading terms, but its general character was clear enough. A second, and thoroughly different event, which must not be mixed up with this first one, was the speech delivered by Mr. Lloyd George in Paris, and circulated to the press with such careful organisation that it was the immediate subject of the wildest rumours within a very few hours of its being delivered.

We say that these two things must be kept quite distinct, for, though they are obviously related, their effects are very different. By far the most important of the two is the proposal to establish an International War Council. The proposal has been defended strongly, and as strongly attacked. The real truth is that such an order should receive our careful support, and at the same time the fear of its extravagance in action, or its cramping the Higher Commands in the field, or its causing delay, and even of its giving an opportunity of interference by civilians with military problems, may easily be exaggerated. The purport of this new organ is to increase the unity of action existing between the Higher Commands of the Western Allies, and it will be judged according to its success in fulfilling this function. But we must remember that such unity of action has existed since the very beginning of the war, and will continue to exist until its close. Such a new department, the creation of such a new organ, may tend to facilitate its unity of action, but it is the wildest nonsense to talk of its being hitherto absent, of each front having its own interest, and of each Army concerning itself with its own security and success alone, and not with its neighbours. There has been, and will continue to be a strict co-ordination.

Nor is it very pleasant to remember that those who have failed to observe so elementary a truth (without which it would have been impossible to fight the war at all), only do so in moments of strain after or during some difficult moment. There is not, in the whole history of the Alliance, any such example of co-ordination as the British and French Armies have shown in the last three years. It will be perfectly clear to the historian, as it is to the simplest of modern observers, that all the great actions were fought upon a common plan, dovetailed one into the other, and were the product of a most remarkable co-ordination of wills. Had this not been the case, the story of the fighting on the West would have been different. That it was the case is the great merit and even the glory of the leaders who have had the tenacity, the patience, and the goodwill to effect that co-ordination in spite of the enormous difficulties attaching to any Alliance, and have kept it intact and even increasing throughout a period of three years.

As to whether the presence of civilians upon this new Council will be hurtful or not, it is indeed a matter for discussion; but the limits within which harm could be done by the presence of such civilians are not very wide. It is inconceivable that men like Sir Henry Wilson or General Foch would listen patiently to instructions on strategy by such chance people as the action of modern Parliamentary life had given them as colleagues. It is hardly conceivable that even politicians should have the infelicity to air their opinion upon so difficult a trade as war in the presence of such soldiers. It is one thing for a politician to get rid of some set of domestic expert advisers at home who do not agree with him, and to replace them by another; it is quite another thing for anyone knowing his ignorance of the subject to pretend to correct the strategy of the man who won the Battle of the Marne. We need have no fear of such a folly.

In the second matter, that of the Paris speech, the proper attitude is surely well marked. First, that it was only a piece of sensationalism which will be as ephemeral as all such theatrical things are; and, secondly, that it has been apologised for in the House of Commons, and may therefore be now decently buried. It is always a mistake, of course, to startle people when they are under a strain, and it is always a pity that those things which hurt the reputation of one's country, however slightly, should be said abroad. But it is easy to exaggerate the harm done even at the moment, and even now the incident is half forgotten.

There is one thing only which dominates at once men's minds and the fate of the world; and that thing is the effort of the Western Allies to break the Prussian military machine and the counter-effort of the Prussian leaders to save themselves from disaster. There is only one policy which really concerns us: it is not a policy of criticising this man or that. The one and only policy which alone concerns us, is the policy of maintaining intact every possible force making for endurance, and therefore for victory. The whole of the war turns upon that one factor. Had this factor not failed us in one great member of the Alliance—that which was formerly the Russian Empire—victory would long ago have been ours. Unfortunately, it failed entirely on that side. We must see to it with the whole strength of our hearts that it does not fail in the West; that it does not yield to ill-formed attack, whether by persuasion, by weariness, by misconception, or by that basis of errors in time of war, the panic of excitable civilians after a reverse.

There is perhaps one thing more to be said about this matter, which is that the mere magnitude of the war on the Western front is such that little—happily—can now be done by those outside the armies to deflect its course, or to arrest its momentum. The organisation of the forces on so great a scale, their now long tradition of action, and their continued discoveries in the field of tactical inventions, the way in which they are bound up with the whole national interests of the Western peoples, and the way in which every family throughout those peoples is now bound by ties of blood to the Armies, make any serious perversion of their object difficult or impossible. The fatal errors of civilian experiments were committed long before the war had reached its present stage. It is morally certain that they cannot be committed to-day.

The Italian Front

By Hilaire Belloc

Calling up of the German Class 1920

BEFORE touching upon the two main episodes on which all eyes are directed this week—the resistance upon the Italian line of the Piave and the rapid retirement of the Turks in Palestine, I would like to point out a little piece of news which appeared this week in our press without headlines and therefore passed almost without comment.

It was far the most important piece of news which we have had since the summer. It was official, and its full meaning is thoroughly understood by those who sent it out. . . The Germans have called up Class 1920.

It is possible that in this the fourth year of the war, the full meaning of that sentence may be missed. Here, then, in the briefest possible space is the meaning of this fundamental piece of news.

- (1) The French have not yet called up any of class 1918.
- (2) Germany called up 1918 exactly this time last year, and the fighting—*mainly the fighting in Flanders*—has eaten up not only 1918, but already so large a part of 1919 that she is now compelled to call up 1920.
- (3) Class 1920 means the lads who are not yet eighteen. The oldest of them will only be eighteen on the 1st of January and the youngest of them is *not seventeen*.
- (4) The German Empire has for the first time since the war began been compelled to call up three classes in exactly one twelvemonth. When she called up 1918 a year ago she was two years ahead of the normal. She is now four years ahead. I will leave it at that.

* * * * *

In order to understand what has occurred in Italy during last week, let us first summarise the news and then refer it to the map with a commentary which will show what the geographical situation of the Italian defence has been.

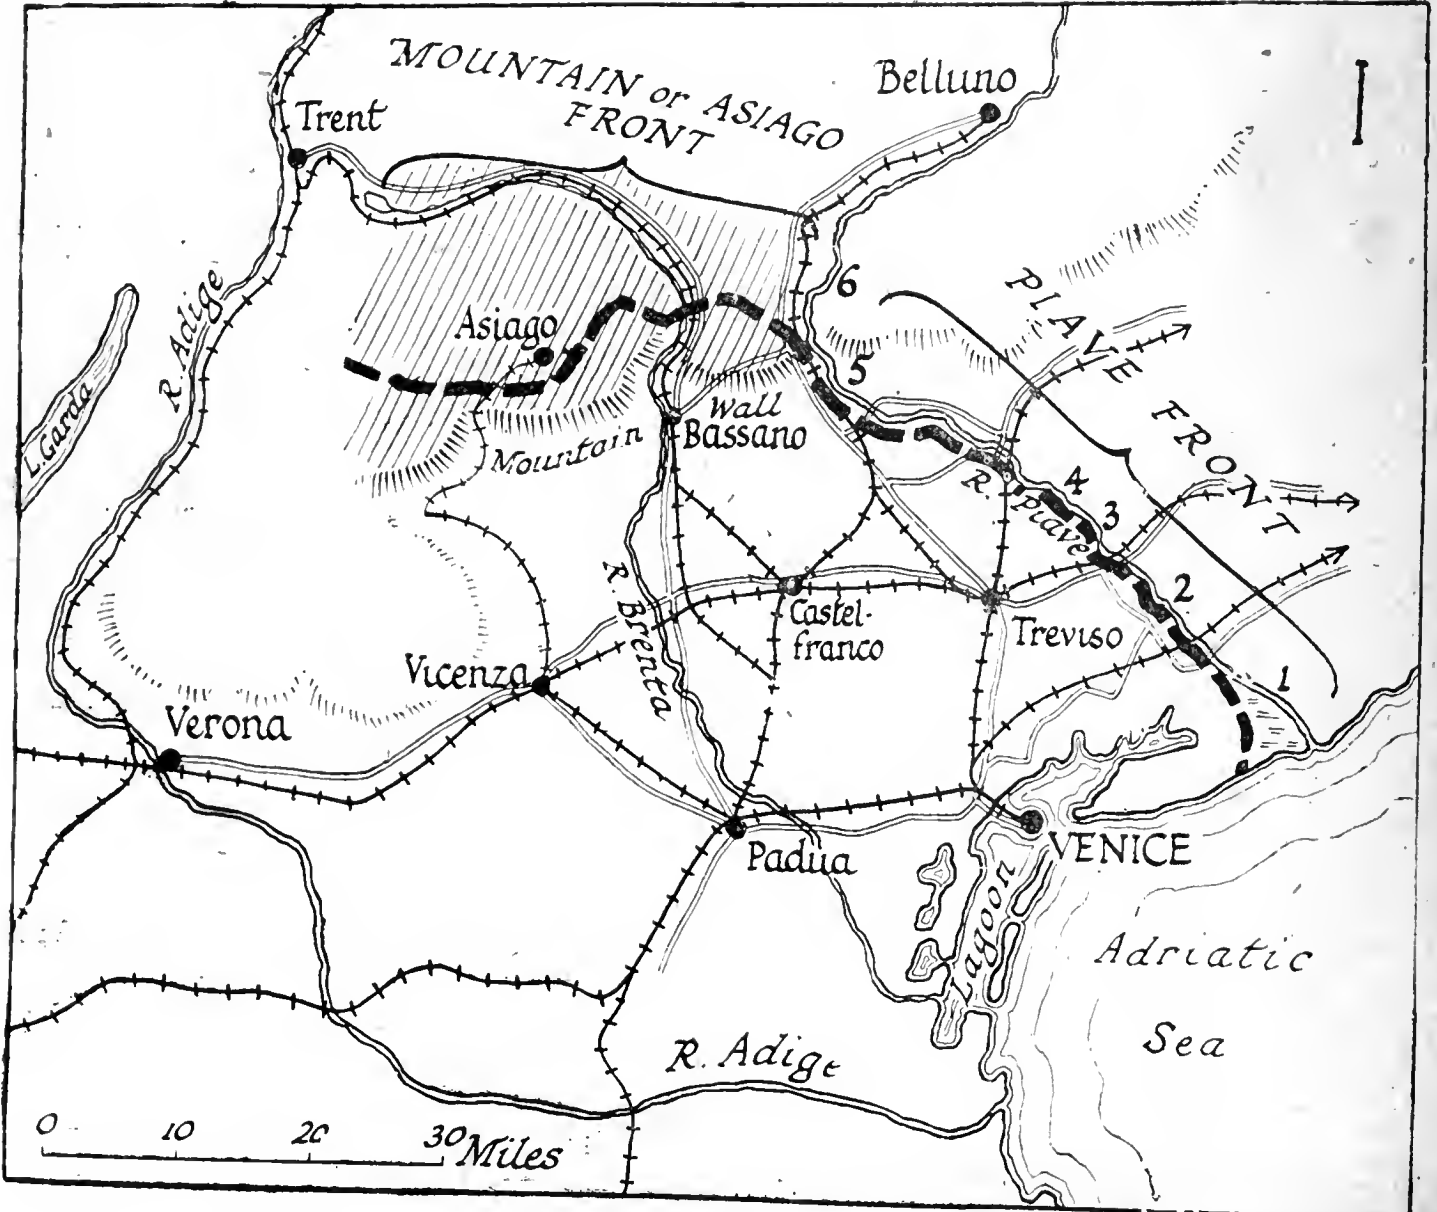

Upon the night of Sunday, November 11th-12th, that is ten days ago, enemy pressure developed against the Italian

left wing on the Asiago Plateau. He attacked the Monte Lombarda position and the lines to the right and the left of that position consistently, but was still held. The Alpini whose bureau of recruitment is Verona were the chief elements of resistance here. The attacks continued during the whole of Monday, but did not progress. Meanwhile, upon that same day, at the other extreme of the line, on the right near the Adriatic, forces apparently wholly Austrian put over a strong barrage at dawn, cutting off the bend of the River Piave at Zenson, throwing pontoons across, and there establishing a bridgehead. This was the first crossing of the Piave effected by the enemy. Upon Tuesday there was little movement upon the Piave, but in the night of that day the Monte Lombarda was lost. In the afternoon of the same day the enemy was attacking south of Gallio to force the lines on the Monte Sisemol. Before the end of Tuesday four new attempts were made by the enemy to cross the Piave at Quero, Fenere, St. Dona and Intestadura, while certain Hungarian troops advanced through the marshes of the Lower Piave up to the old branch of the river to the west.

On Wednesday, the 14th, the Italian front on the all-important Asiago sector was still holding strongly from Monte Sisemol to the peak of Castelgomberto. It was remarked that the enemy was bringing up larger numbers in this district than before. To the right in the Brenta Valley Cison was still held. But the Monte Tomatico was lost.

On Thursday, the 15th, the Asiago thrust became more serious, but it was apparently contained by the Italians save in the Brenta valley itself, where the enemy entered Cison. The Piave line during the day remained unchanged; the bridgehead established by the enemy on the Zenson loop was still fairly established; the crossing lower down by the Hungarians on the marshes had not advanced and had still the appearance of a mere feint.

On Friday, the 16th, came the second serious attack upon the Piave in the following form: At dawn the enemy forced a passage of the river. He crossed at two points, Folina

and Fagare. At the first of these points he suffered a local disaster. The Italian account is that the troops which had managed to cross were all either annihilated or captured through the efforts of the 265th and 266th regiments. But the main crossing was made at Fagare, and this though very heavily counter-attacked by the Novara Brigade and the 3rd Bersaglieri (forming the 54th division) stationed itself upon the western bank, and still held the bridgehead upon the Friday night.

Meanwhile, on that same Friday, the 16th, the Monte Prassolan, a very strong point, between the Brenta and the Piave, fell to the enemy.

Early on Saturday, the Italian line on the watershed hills between the Piave and the Brenta gave way slightly, but there was a successful counter-attack against the bridgehead which the enemy had established at Fagare, and further down the river the enemy's attempt to give himself elbow room upon his bridgehead at Zenson was defeated. Indeed, in these two actions against the enemy bridgeheads, the Italians took over 1,200 prisoners.

On Sunday the full effect of the loss of the Tomatico height was felt, and the Italians lost Quero, the point where their mountain defences touch the Piave, and fell back on Mt. Tomba, the last point at this part before the plains.

Now let us put all these things together and see what the whole picture means.

The Italian front—still subjected, remember, to superior pressure—consisted when the enemy's present manoeuvre began, ten days ago, essentially of two limbs. One limb ran along the Piave from just north of Quero to the sea, the other limb ran from Quero north of the "wall" which the foothills of the Alps make as they fall sharply upon the Italian plain.

The positions governing these two limbs differ very much the one from the other.

The defence upon the Piave is concerned with the maintenance of an obstacle while reinforcements come up, and politically as well as strategically with the covering of Venice. It is felt that the loss of Venice would be a political blow of the gravest character, whilst strategically the loss of Venice would mean the loss of any power to act upon the Northern and Central Adriatic, and that, though I do not pretend to comment upon maritime strategy, which I do not understand, would obviously be a very grave weakening to the whole Italian position. Further, the holding of the line of the Piave is the holding, as we have seen in previous articles, of the "waist" where the distance across the Italian plain from the mountains to the sea is at its minimum.

Although the attention of the public has been chiefly directed to the resistance upon the Piave, strategically it is the other sector, the sector in the mountains, which is the most important; for if the mountain sector be forced not only is the line of the Piave turned, but no very rapid retirement from it will be possible. If the reader will look at Sketch Map I, he will see that the coming down of the enemy, over the mountain wall west of the Piave, would mean his immediate appearance upon the main railway lines on the Northern Italian plain (Vicenza-Treviso and Vicenza-Padua-Treviso) which are the vital communications of the army on the Piave. If the enemy can cut that railway it means a complete disaster to the forces now upon the Piave banks.

The fact that the enemy is only now growing in strength at this second sector is, by the way, clear enough proof that he never expected so great a success as he attained when he attacked on October 24th upon the Isonzo. But that is ancient history, and we can neglect it for the moment.

When we contrast these two sectors we discover the favourable point that communications and supply are far better for the enemy upon the Piave sector than upon the mountain sector. Were it otherwise the position would be even more perilous than it is. He is rapidly concentrating against the mountain sector (which may also be called the Asiago sector), but he is handicapped by the nature of the ground. He has two or three good roads which he made eighteen months ago, during the Trentino offensive of 1916 in this same region, but he has only one railway down the Upper Adige valley to supply him. It is a bottle neck through which everything must come. Further, the season is very far advanced for operating in the mountains. Snow has already fallen heavily upon all these hills. That, upon the whole, is an advantage to the defence.

Turning to the other sector—that of the Piave, we must remember that if the enemy has any hope of getting through in the mountains, it is actually to his advantage that the Italian line on the Piave should not break. It is to his advantage to hold as many Italians there as possible by perpetually menacing the river crossings. We must further note that he has not yet made his chief effort to cross the river at all. How long it will take him to bring up his heavy artillery and its great weight of munitionment (for this is the slow business, much more than the mere bringing up of the guns), we cannot tell. He has the most excellent communications behind him—three main railways from his bases and three railways, two of them main railways, across the plain to the Piave, with three great main roads and innumerable good cross roads.

We know from experience that it is not the habit of the enemy to begin a bombardment until he has a very great head of munitionment ready, and that when his heavy pieces are working at all in these efforts of his, they begin all together and suddenly. He counts on that for one of his elements of surprise.

Now until this use of heavy material begins, all the actions against the Piave line, all the attempts, successful or unsuccessful, to establish bridgeheads are secondary matters. For what they are worth it may be of advantage to examine them in detail, but only after the proviso that we must not regard them as main actions or even as parts of a main operation as yet.

The places attacked are marked upon Map I, with the figures 1, 2, 3, 4, 5 and 6. Of these (1) represents the crossing over the mouth of the Piave in the marshes of Grisolera; (2) represents the crossing at Zenson, which does not concern the actions of this week, but where a solid, though restricted, bridgehead has been established by the Austrians; (3) represents the crossing at Fagare; (4) that of Folina; and (5) and (6) the abortive and defeated attempts at Ferne and Quero on the Upper Piave, just below the point where the mountains sector joins on to the river sector.

We are concerned this week only with what the enemy is doing at the mouth of the river at (1), and what he has been doing at (3) and (4).

His action at (1) just above the mouth at Grisolera is obviously so far little more than a containing movement to draw Italian forces as far down the stream as possible. The last ten or eleven miles of the Piave between the bridges of St. Dona and the sea run between artificial embankments and are separated from the old course of the river by a great belt of hollow land three to five miles broad intercepted by innumerable dykes, along which run narrow, primitive roads very bad for any form of military transport. Behind the old course of the Piave is, first of all, to the north, a very marshy district, impassable to an army; next a canal with high dykes leading away to

the south-west, and lastly, lagoons, the end of the Venetian system of lagoons. The enemy can do nothing here until he turns the Piave line.

His effort to establish bridgeheads above the main Treviso railway line has occupied public attention this week seriously, especially as it has been the occasion of brilliant counter-work by our Allies. But we must take neither the effort nor the counter-work at too high a value until the main bombardment begins. All these are mere preliminaries. However, let us look at the details of these attempted bridgeheads.

The efforts were made in that part of the middle Piave where the Central road and railway cross at the point called "Ponte di Piave"—that is the Piave bridge. The river is here a broad channel of gravel banks with streams in between, varying in depth from a mere trickle in summer to a full torrent after heavy rain. These gravel banks form a great mass of islands in the stream at its normal level. Profiting by these islands and by the lowness of the river Austrian troops crossed (mainly by wading) at two points, one at Fagare just north of the railway, and the other four miles upstream at Folina. It was on the morning of Saturday last, before daybreak, that these crossings were effected. Two batteries of Italian guns were overwhelmed after a very stout defence at Fagare, and altogether four Austrian battalions—or something less than 4,000 men—crossed the river and established themselves upon the further bank. These units belonged to the 29th division recently arrived from the Russian front. At daybreak, apparently, or shortly afterwards, the Austrian force which had thus established itself on the west bank of the Piave, was counter-attacked by the 54th Italian division, which took several hundred prisoners, and, without destroying the bridgehead, pushed it back to within very narrow limits.

The second crossing made at Folina was less successful. A single enemy battalion crossed here, but all its members who reached the further bank were either killed or taken prisoner.

We now turn in detail to the mountain sector, which is what really concerns us. We note the general characteristic of the fighting here to have been a very stubborn resistance against what is clearly a rapidly increasing enemy pressure. There is no material whatsoever for forecasting the future events that may take place in this region. We cannot contrast the forces engaged in numbers, in material, or in moral. All we know is that the communications of our Allies up from the plain are very much better than those of the enemy, who is seeking to come down on to the plain, and short of that the only commentary that can be made upon the fighting is geographical.

We have already seen that if the enemy succeeds in debouching upon the Italian plain, he has a really great and almost decisive victory within his grasp.

Now the descent from the Alps on to the Italian plain here is not, as one often finds in a mountain range, a gradual lowering series of foothills which melts into the flats. On the con-

trary there is what I have called a wall—a sort of rim or buttress running all the way along from the Piave to the Adige, and the heights of the crests upon this wall sufficiently indicate its character. You have, for instance, the Grappa, about 1,800 metres (nearly 5,500 feet), the Caina of over 3,000 feet; the Sumio of nearly 4,000 feet; and the lower heights connecting them are in the same scale. When you look up at this wall from the Italian plain you see everywhere a very steep high bank, which contains behind it to the north pockets and saucers of a land of which it is the rim.

This wall is cut by one main avenue of approach to the plains. It is the valley or trench of the Brenta river. It has a railway all along it and two good roads on either bank. It is the only way by which any considerable force in the mountains can break through to the plains. To master that way and to come down along it is the whole effort of the enemy at the present moment. It corresponds, in this battle of the Piave, exactly to what the Caporetto Road was in the last and disastrous battle of the Isonzo.

Now to master a road of this sort the first thing one has to do is to make certain of the heights above it upon either side, and that is what the enemy is fighting to obtain all the way from Asiago to the Piave.

There are a large number of crests, more or less united by ridges in the difficult and complicated land of this mountain sector, and it is upon the ability of the Italians to hold these crests that the issue will depend.

Last week they were in possession of Sisemol and Castel Gomberto, the former under 5,000, the second under 6,000 feet above the sea. They held Lombara, rather more than 4,000 feet high, the very important height of Prassolan, not quite 5,000 feet high, and the Tomatico, on the Piave end of the line, a few hundred feet higher. Sisemol and Castel Gomberto are the most important of these; so long as they are held the enemy cannot get down into the steep, rugged and wild Val Frenzela, the second way down into the Brenta Valley. The Italians lost, however, the crest of the Lombara and Prassolan, so that the enemy were able to go a little further down the Brenta Valley and to occupy Cison, a village in the midst of that valley about 12 miles (as the road goes) from the plain. They lost the Tomatico and as a consequence they lost Quero.

Everything now depends upon the power of the Allies to hold what is left of this mountain sector securely. As will be seen from Sketch Map III., between the line now held and the edge of the wall, the belt varies from barely four miles from the site of the lost Prassolan height to nine or ten miles south of the salient formed by the peak of Castel Gomberto. It is an average of rather more than five miles. But the mere reduction of this belt is not the essential thing for the enemy. The essential thing for him is to master the heights on both sides of the Brenta Valley. His only other policy is to elbow the line back from the Piave and weaken it at the junction of the mountains and the river. But that would not give him

such decisive results as would a success on the Brenta bringing him down to Bassano.

None the less it is at this point that the chief danger lies at the moment of writing. Quero has gone and the news of the struggle last Monday told us that Mt. Tomba on the edge of the plains was then in peril.

PALESTINE

In Palestine the enemy lost upon Tuesday last, the 13th, the positions he had tried to take up upon the Wadi Sukereir, twelve miles north of Askalon. He fell back five miles to the Wadi-es-Sukar, covering Jaffa, up the higher part of which runs that lateral railway to Jerusalem, the importance of which was pointed out last week. Over 1,500 prisoners, twenty machine guns and four guns at least were taken during that day's advance.

On the 14th took place a success of high importance. The junction between the main north and south railway and the Joppa-Jerusalem railway on the Wadi-es-Sukar was captured.

Upon Thursday, the 15th, this steady advance along the sea coast had reached the line Ramleh-Ludd and so came round to a point on the sea coast only three miles south of Jaffa.

On the 16th no considerable advance was made; the enemy claimed a successful resistance on that day, still holding the lines south of Jaffa, but General Allenby reported that information had reached him that the enemy was entrenching a position north of Jaffa in front of the river Auja. On the evening of that day, Friday, the 16th, the total number of prisoners that had passed through was some 9,000.

On Saturday, November 17th, the Australian and New Zealand mounted troops entered Joppa. There was no opposition, the enemy having voluntarily retired behind that town, presumably towards the trench system which has already been mentioned as traced in front of the river Auja.

The situation thus created in Palestine is very interesting. Politically the enemy is concerned with the retention of Jerusalem—at least it may be presumed that he is. Strategically, he must continue to supply his army as he falls back.

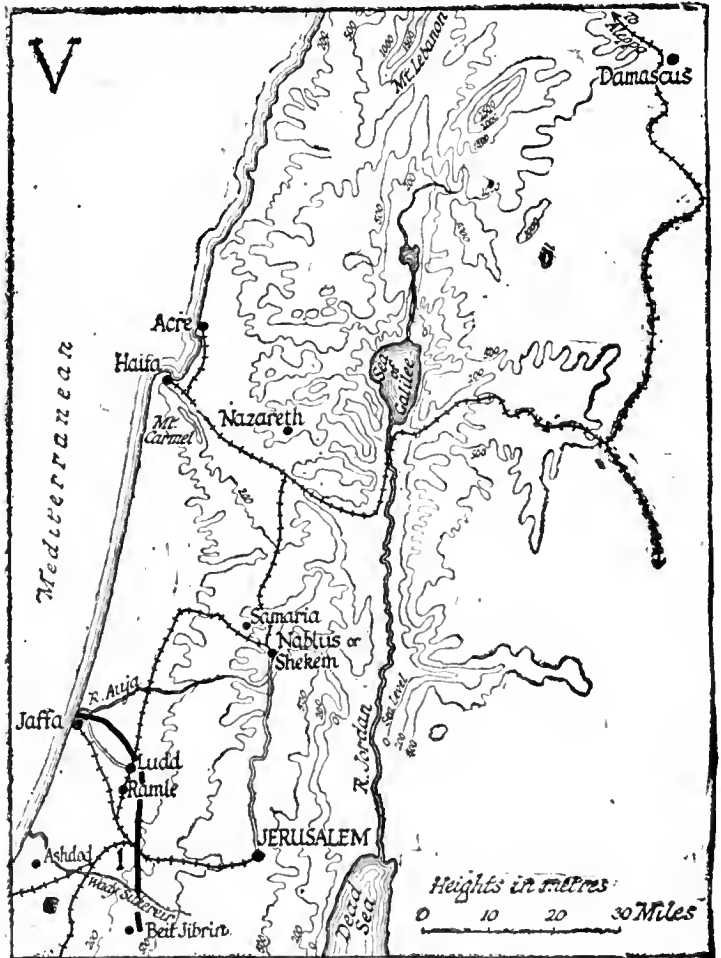

The main line of supply comes down from the north on to Damascus from Aleppo, which is presumably the centre of all his operations, and where he has we know not what concentration of troops ready for action southward or eastward. His line of supply for his Palestine army comes down east of the great mountain mass of Lebanon to Damascus, and Damascus is his base of supply and organisation for all his forces to the south.

From Damascus the railway goes down from the plateau nearly parallel to the immemorially old road from the east into Palestine, crosses the Jordan, where invaders have always crossed it, just below the Sea of Galilee, and then in the plain below Nazareth turns south again, sending out a branch to Haifa, near Mount Carmel and so uniting Damascus with a tolerably sheltered roadstead.

Meanwhile, the main line goes on southward, leaving Samaria on the right to the neighbourhood of Nablous (which used to be Shechem). From this point a carriage road (probably very much improved for the purposes of this war) can take supplies along the ridge of the mountain land by a very tortuous way for a distance of some 40 miles to Jerusalem. Until this week, when the British force captured the junction at (1) there was also railway communication with Jerusalem all the way. At the present moment, not only is the junction at (1) in British hands at Ramleh and Ludd as well as Jaffa, the enemy having lost all the advantage he had of the lateral communication of the Jerusalem railway, but he will still be

able to supply his front and to be in touch with Jerusalem by two avenues of supply, the road and the railway, until, or if, the critical point of Nablous is lost to him. When that goes he has obviously nothing behind him but the Haiffa-Damascus Railway. If that goes he will have lost all Palestine. Whether he intends to stand there we do not know. There is not an indication in the despatches to tell us, save that he has prepared a line upon the south side of the Auja river, which perhaps he will try to hold.

The astonishing part of the whole of this story of the advance through Palestine is the way in which the problem of British supply has been solved, and when we consider the distance of the Egyptian base and what country lies between that base and the first green of Gaza, the solution of that problem is one of the most heartening episodes of the Great War.

We are naturally kept ignorant of all the details. We can only note the result and admire it. We may be certain that the enemy never expected so rapid an extension of supply to be possible. We must remember in this connection the parallel instance of the work done by the Royal Engineers in the advance on Bagdad. It was really their fertility of resources and industry which made that success possible, and it will seem something of the same sort is determining the campaign in Palestine.

We must remember with all this that there has been no set challenge to the British advance since the Gaza-Beersheba line was turned. The crisis of the campaign can only come when the pursuing army reaches some main defensive position on which the enemy has elected to stand.

The Conditions of Victory—VI

The Test of Poland

The first condition of victory, we have seen, is the fundamental military point that, unless the enemy suffers military defeat, the Alliance is itself defeated—with all its objects.

Next, we have seen that even though that military result were achieved, and as fully as possible, its fruit must be Restoration, Reparation and Guarantees: The formula which Mr. Asquith laid down with admirable clearness long ago, which includes all that can be said, and excludes all that need not be said upon this vital matter.

But we have also in all this affair what is very important in any practical matter, and that is a *test*.

Whenever you are doing something with your hands, making something in the real world, you apply a test. You have first, your general thesis, as, that you desire to build a bridge over a river in spite of the opposition of such and such interests. If you can't build your bridge at all, if the interests opposing you are too strong for you, then you are defeated and there

is an end of it. There is no more question of the bridge. Supposing you get the better of those interests, it is still necessary that the bridge should come into existence, unless your victory is to be quite barren. But it may well be that your opponents, though unable to prevent your obtaining the outward symbols of success, unable, that is, to prevent your getting access to the river and even building your bridge, can interfere with you in one way or another, so that your bridge, when you come to make it, does not fulfil the function for which alone you undertook all this effort. You meant, for instance, to make a bridge which would enable your farm carts to go from one side of the river to the other, and unless they could so pass it was not worth your while to make a bridge at all. Well, if your opponents let you throw some sort of bridge across the stream yet succeed in preventing its being strong enough to carry your carts, they have, in practice, won.

You have then, in this simple case, a *test*. Can you or can you not build a bridge for the purpose you intend? Will the bridge you build carry a cart? If it won't, whether from

your folly or from your opponents' cunning or greater strength—whatever the cause may be—you have failed, and might as well not have undertaken the effort.

In the case of the Great European War, we have a curiously simple test afforded us: It is the test of Poland.

Poland is a test for both parties to the great struggle. A Poland of the sort which the Allies desire to establish will be the proof, and one of the main guarantees of their victory. A Poland of the sort which the enemy desires to establish will be a proof and a guarantee of *his* victory. With the possible exception of Sicily during the first Punic war, there has hardly ever been so clean a test (not an object) of political struggle and of its results.

Unfortunately, this clean, obvious and, as it were, necessary test is not easily presented to Western eyes. It is a great pity, but the pity is inevitable.

Of the four Western Allies, the word "Polish" means to most Americans, I suppose, certain immigrants who come in large numbers, and most of whom have come in the past as subjects of the Russian Empire. The same word means to the average educated Englishman a man coming from certain districts which once formed a State of which he has heard little, with which his ancestors came but little into contact, which lay far off, and which he vaguely understands to have disappeared.

France and Poland

The French and Italians being Continental people and having a great deal in common with Poland, on account of the predominant religion of the Poles being the same as that of the French and Italians, have somewhat more acquaintance with the problem, and of the two probably the French, taking them all round, have rather more familiar acquaintance with it than any of the other Allies—for Polish contingents have fought in the French armies; the question of Polish independence occupied French policy in at least two very important moments—chiefly under Napoleon 1st; the fate of Poland was largely intermixed with the fate of the Revolutionary Wars; there has always been a large Polish colony in Paris; and there was, in quite modern times alliance between the French and the Polish crowns with a Polish King resident at Nancy.

But take the Western Alliance as a whole, and the average acquaintance with the Polish question is small; its apparent direct connection with the various national objects of the Western Allies is smaller still. Geographical separation; the destruction of the Polish State and its dismemberment; the far more vivid and immediate problem represented by the Western aggressions of Vienna and Berlin—all these obscure the essential importance of Poland as a test of victory.

In order to combat these inevitable difficulties, and to impress upon Western opinion the truth, that what happens to Poland is the touchstone of the whole war, let us consider first of all this curious point, which, when it is examined will, I think, impress everyone. Poland, in some form or another, whether at the hands of the Germans, or at the hands of the Allies, is now in active process of resurrection. A Polish State is about to be.

If you were talking now in Vienna (or still more, in Berlin), to the heads of affairs, you would find that they already talked of a Polish State as something in existence, and that their principal preoccupation was the way in which they could make that State subservient to their aims.

I have said that this point is "curious," and so it is. When you think of the immediate past, the generation to which we all belong and its attitude up to the very eve of the Great War, nothing would have seemed more extraordinary during that period than the taking for granted of a Polish State by Russian statesmen and soldiers. The change is at least as astonishing as would be the change from, say, the wage system in this country to a system of guild-co-operation in one of our own great industries.

The subjugation of Poland, the doctrine that Poland was never to be a State again, the conception that Poles were once and for all allotted as subjects to three alien Powers, whose business it was to concur in keeping them subject—all this was simply part of the political air breathed in Central and Eastern Europe. It was the cement which bound together Russia under the Czar, and Berlin under the Hohenzollerns. Everybody with any knowledge of Eastern Europe always said and justly—"Russia" (meaning the old Russia which has now disappeared) "will always tend to gravitate towards a new Prussian alliance because of Poland. Russia may be the Ally of France, but there will always be the insuperable difficulty of Poland. Russia can never push things home against Germany, nor Germany against Russia, because of the common interest of both dynasties in the subjugation of a dismembered Poland."

Here was a very great State, as extensive in area as any one of the average great European States. Its active membership

counting perhaps twenty millions; its culture spread over a wider area even than that which its active patriots occupied; a State with a great historical past; one which the fathers of living men remembered as independent and powerful; one which had produced a formidable bid for freedom in arms within the memory of men now only middle aged. The necessity for combining to keep that State dismembered was surely imperative upon those who were partners to its dismemberment and profited by it.

The Romanoff Offer

But all this was taking for granted two things: first, that the dynasty of the Russian Empire would never be drawn into a war to the death with Germany, such that even the Polish question could be put on one side; secondly that at least the Russian dynastic Empire would survive.

Once a war with fundamental issues of life and death broke out between the Russian dynasty and the Hohenzollerns, it was self-evident that some bid would have to be made for the Poles. We know how, immediately upon the decisive and fundamental character of the struggle being recognised, the Russian dynasty made that bid.

When the Central Empires in 1915 overran and occupied nearly the whole of Polish territory, they were compelled to consider the re-creation of a Polish State. Poland could only be kept *not* a State by dismemberment among several very powerful neighbours. Poland could not be digested as a whole. A mere annexation of all Poland by the two Central Empires alone would have been ruinous to both. They were compelled by sheer necessity to propose a Polish State once they had covered with their armies Brest and Warsaw and occupied all but a small remnant of what was still the active and living home of the Polish people.

If this were true, and we know it was true while the Russian dynasty still stood and while there was still a Russian State, that is, a number of diverse populations united under the autocracy of the Czar, it was still more true after the collapse of the system rather less than a year ago. Against an existing and organised Russian State, an autonomous Poland was necessary to the Central Empires as a barrier. With Russia in dissolution it was still more necessary, not as a barrier, but to prevent non-German elements dominating all Central Europe. The vast Polish territory, the millions of Polish people, with their combative energies, their strong and recent tradition of independence, their sharp separation from German speech and culture, could not be treated as mere provinces subject to Vienna and Berlin.

In that group of Central Europe, which it is the whole object of the enemy to establish, Poland in some shape could only be a sovereign or reputedly sovereign State. The most careful state craft would be used to reduce its power, to make certain that it was vassal, to limit its boundaries; but as Poland it could not but re-arise. And it has re-arisen.

There will now certainly be a Poland: weakened, cut off from the sea, in the orbit of the German influence, more or less openly subject to that influence, but still a State. Or, in contrast to this, a Poland strong, with its outlet to the sea, reacting against German influence and threatening it—and all the more a State.

In general, there are two issues with very little room for any modification of the one towards the other. Either the end of this war will see a Poland re-arisen, but part of and greatly strengthening the German conception of a Central European group under Prussian domination—a Central Europe controlling the Baltic on the north, the road to the East upon the south; or there will be a Poland, much stronger, quite independent, acting as a counter-weight to the diminished and defeated Germanic Empires, claiming to trade freely with the West through the Baltic and so keeping the Baltic always open to the Western Powers; overhanging the Slav States of the south and so preventing any German possession of the road through the Balkans to the East; a beacon also to the Slavs of the Austrian Empire.

By that criterion we may judge our victory or defeat. If the first sort of Poland appears we are defeated. If the second, we are victorious.

In order to judge this truth, which is still unfamiliar to most people in this country, let us suppose an extreme case and appreciate the consequences of it. Let us suppose the question, which seems, and is, so vital to Britain, the seaboard of the Low Countries, settled. Let us even suppose guarantees which prevent further aggression in the Netherlands and Belgium. Let us suppose the Italian claims to the Trentino and to Trieste itself to be granted. Let us even suppose the Kiel Canal to be internationalised, and, of course, Alsace-Lorraine to be restored. These are large suppositions, and, in the ordinary Western view, almost complete suppositions of victory.

But let us suppose with all this the Polish question to be

solved after the German fashion, that is, with the Polish State wholly within the German orbit, and organised as Germany desires. Let us see what follows :

In the first place, the largest and certainly the most intensely cultured of *all* the Slav States would then be a German thing. The lesser Slav States to the south, where Orthodox in religion, would conceive of *all* the Slavs as part of the Central European group and would yield necessarily to that group. As for the Catholic Slavs, whose differentiation within Austria-Hungary is so powerful a factor in favour of the Allies, *their* position would be fixed permanently on the old lines, when the great mass of Poland had fallen into line and appeared as an example to them of the way in which the greatest of Catholic Slav nations could form part of the Germanic scheme.

We ought always to remember that the German faces east as well as west. At least half his energy, more than half his historical tradition, is concerned with meeting, and if he can do so, with colonising or subjugating the Slav. There is hardly any loss upon the west or the south which, if he still retains his sense of Empire over the Eastern Slavonic marches, would not seem to the German a fair price.

A German Poland

Next let us remark that with Poland organised in a German fashion, and at Germany's bidding, all the East is under German influence. The high Polish civilisation would work as an outlier of Central Europe. It dominates mentally just as it outflanks geographically the Germanic movement towards the East. A German Poland, however veiled the German influence might be, would render secure the road to the East through Constantinople for Vienna and for Berlin. Such a dependent Poland would make of the Baltic a completely German sea closed at the German pleasure.

Lastly, let us note what modern people usually exaggerate so much as to make it cover the whole field, but what has none the less a very important aspect ; I mean the industrial effect, of such a settlement. Already the manufacturing centres of Poland are largely in German hands. Let Germany organise and establish the new Poland after her own plan and it will become largely industrialised, and the wealth so produced will be part and parcel of the general Central European industrial system, which is the economic foundation of modern Prussia. If Germany wins, the Poland she will make will be a Poland economically and industrially one with Westphalia and Bohemia. It will probably lie within one customs wall ; it will certainly be arranged to follow all the lines of German industry, upon the German model.

Contrast such a picture with the picture of a Poland which the victorious Western Allies might establish, and see what the effect of such action upon their part would be.

The culture of Poland has hitherto been Western. It has formed a great outlier of Western influence beyond Central Europe. It is curious to note how, the moment you leave the influence of Berlin, going eastward, when you come to the Posnanian Polish countryside, you leave behind you the Prussian vulgarity and insufficiency in architecture, in furni-

ture, in painting, and are once more in the air of the West. It is true of nearly all externals, and of the profounder spiritual things as well. You might almost say that spiritually Poland was in that distant and isolated Eastern march a colony of the Atlantic and the Mediterranean. Nor has anything more affirmed Prussian power than the Prussian claim to reverse such an influence of civilisation upon the further borders of the German group.

Polish Independence

Geographically again, the establishment of a strong and independent Poland, singularly diminishes the Germanic influence. It would act with sovereign power to within no great distance of Frankfurt upon the Oder ; it would be a solvent to the German influence that has been spreading eastward for so long. It would join hands through Moravia with Bohemia, and far to the south, right up to the Carpathians and in places beyond ; to the north upon the Baltic, eastward through the marches where the Polish touches the Russian culture, it could form a great State, the rival to its former masters in Vienna and Berlin. It would certainly be stronger than the Magyar State. It would be the one great counterpoise on the east, and a most efficient one, corresponding to any western settlement and supplementing it. A strong and independent Poland at once creates a national feeling among the Catholic Slavs, not only of Bohemia, but of the south near the Adriatic. It is a wedge driven into the Germanic hegemony from the Elbe right away down to Istria.

There remains the industrial effect : a strong and independent Poland would control the minerals of Silesia ; would make its own laws forbidding alien influence in its great manufacturing towns. Lastly, and most important of all, from the point of view of Britain, it would have an avenue of export and import by sea. Danzig is the core of the business ; and just as Poland will be the test of the Great War, so Danzig may properly be said to be the test of Poland. If after the war Danzig is still Prussian, Prussia has won.

A Poland representing the victory of our enemy would bear these marks :

The Polish districts seized by Prussia would remain under the tyranny of Prussia. Austrian Poland would remain under the milder rule of Austria. Autonomy would be confined to the Kingdom of Warsaw—above all, there would be no access to the sea.

A Poland great and independent would recover the provinces seized by Prussia, including not only the Posnanian belt, but Silesia, with its coal and all its mineral resources—but chief point of all—it would get to the sea and Danzig, the historic sea-town of the Poles, would be its port. If Poland have no port the Baltic, after this war, is German. If Poland have a port—and Danzig is its port—the Baltic will not be a closed but an international sea. The point is of vital importance to this country, even on the narrowest issues, and if misunderstood, and its value underestimated, the effect of that false political judgment will run through all our history for generations to come.

H. BELLOC

Clemenceau

By J. Coudurier de Chassigne

THE last news from France is the best we have received for many a day. The appointment of M. Clémenceau to the Premiership is the turning point of the convalescence of my sorely stricken country, which started under M. Ribot's brave and honest treatment of the Vigo-Almeryda affair. The patient improved under M. Painlevé's naïve methods, but was imperilled by his wrong diagnosis of Daudet's patriotic intervention against M. Malvy and his traitorous confederates, M. Leymarie and Paix-Séailles. Its complete recovery is now assured by the vigilant care and energetic remedies which Dr. Clémenceau will apply to the body politic.

The accession of M. Clémenceau to power means so much for France, and also for England, that I may be forgiven for trying once more to explain the inner significance of the return of the Grand Old Man of French politics to the leadership of the Government. First let us render homage where homage is due. The President of the Republic has behaved under these circumstances, as always, like a true patriot, and on this point I should like to remind my readers of my recent article in LAND & WATER on M. Poincaré and M. Painlevé, for every word of it has come true. M. Painlevé, straightforward and well-meaning as he is, had no parliamentary skill. In that he could not talk and could not act, he had to go. But for M. Poincaré's high sense of loyalty, his fall might have been followed by

another make-shift combination, which might have satisfied politicians, though still leaving the country in grave peril. Nor should we forget that the President of the Republic alone has the power to choose and appoint the Prime Minister. This choice, easy in ordinary times, was more than difficult at the present juncture, for between these two men a political feud had existed, increasing every year since 1912.

M. Clémenceau was the bitterest opponent of M. Poincaré, not only during the latter's Premiership, but also at the time of his election to the Presidency of the Republic. In spite of M. Clémenceau's violent campaign, M. Poincaré was elected by the National Assembly at Versailles. But instead of making peace with the President after his election, or even since the war started, M. Clémenceau remained irreconcilable. He looked on the President's policy as a national danger ; and did not mince words on the subject either in his articles or in his speeches. Up to the last three months a reconciliation between the two seemed impossible, though M. Poincaré never said or did anything in public to justify M. Clémenceau's animosity. But both men are before everything patriots.

For some time the current of parliamentary and public opinion had proved to M. Poincaré that M. Clémenceau was the only statesman who could cleanse France from Boloism, and at the same time direct the war with all the energy required. Common friends of both statesmen had lately been

preparing the ground for a reconciliation based on the highest and most unselfish motives. The psychological moment came when the two former adversaries met at the Elysee for the first time since M. Poincaré became President. They had a talk which lasted an hour and a quarter, during which they agreed to bury the past and their old grievances for the sake, not of their future, but of the welfare of France. I know no happier omen for my country.

M. Clémenceau has a marvellously versatile mind, and is, moreover, a great master of the French language. His books, his plays, his innumerable articles, his brilliant polemics in the French press, during a period which covers more than half a century, would alone assure his fame as one of the most illustrious publicists of our time. But before everything, he is a fighter. His logical and pitiless brain, his energetic temperament, unite to make him the king of polemicists. No one ever equalled him in the terrible art of destroying whatever he had made up his mind to attack. Endowed with a rare gift of eloquence, at the same time simple and convincing, he has spent the greater part of his political life in demolishing the schemes of his political adversaries. He was easily the ablest Cabinet wrecker ever known in France, where Governments under the republican regime have been made and unmade, with a rapidity disconcerting to those who did not realise that we have been making experiments for thirty years in the difficult science of establishing a permanent regime on the ever-changing basis of democratic control.

When M. Clémenceau came to power twelve years ago he had passed the prime of life, but, at last, he was given his chance to build up with the materials of all the structures he had himself pulled down. For three years he was supreme master in France. He came to office after the terrible hurricane of the Dreyfus affair, and it must be recognised that under his rule France began to forget the Dreyfus case. For reasons which it is better not to discuss here, M. Clémenceau's policy on military questions was not as successful as his Home and Foreign policies. But one man, however strong, cannot remodel in three years the whole fabric of the internal administration of a country as bureaucratic and traditional as France.

If M. Clémenceau were to tell us the real motives of his apparent failure over the question of military armaments for instance, I am convinced he could clear himself from any accusation of lack of patriotism, or even of negligence. On the other hand, his foreign policy was masterly. It is true that he found in his old friend and colleague M. Stephen Pichon, who for years was on the staff of M. Clémenceau's paper, *La Justice*, an admirable collaborator whose loyalty to his chief and to their common policy of the Entente Cordiale never wavered. Only once was the friendship between M. Clémenceau and M. Pichon clouded by a misunderstanding, when M. Pichon backed with all his strength M. Poincaré's candidature to the Presidency. But this episode is now entirely forgotten, and the two life-long friends are again united in the common fight against the enemy, at home and abroad. On the all-important article of faith in our foreign policy since 1900, they were always of the same mind, for both realised that France and England if they wanted, not only to triumph over the German menace, but even to live, had to stand side by side. The return to power, in the same administration, of M. Clémenceau and M. Pichon is the most decisive proof that could be given to the world that the miserable intrigues of the Bolo party, and of pro-German financiers with their chief, Caillaux, have been defeated. Their end is near. That fact alone ought to fill all hearts with joy. I must own that personally, however great my admiration and my sympathy for M. Clémenceau, I have never been quite sure that his great destructive qualities are balanced by his constructive power. But that which in times of peace might cause some anxiety gives me to-day the conviction that M. Clémenceau is the right man at the right moment.

What is the first duty of the Prime Minister? Not to reorganise the French administration, but to purify by every conceivable means the whole country from the poisonous intrigues of German agents. To accomplish this task, honesty alone is not enough. France needs a statesman whose grip is of iron, for he will have to strike down traitors, whoever or wherever they may be. Influential politicians, powerful journalists, wealthy financiers who have betrayed their country must be quickly arrested, judged and condemned without any regard to the consequences such action may have for this or that political party.

M. Clémenceau has already given proofs of his fearless patriotism. Though a Republican, he has collaborated with the Royalist Léon Daudet in attacking in the press Vigo-Almercyda, Bolo, Malvy, Leymarie, Caillaux, and all their confederates. In the Senate he has denounced the complicity of M. Malvy, then Home Secretary, with traitors who tried to sell France to the enemy. M. Clémenceau's speech, one of the most powerful he ever delivered in his long public career, brought down the Ribot ministry in spite of the

Premier's perfect honesty of purpose. M. Ribot, though he did take action, spared too many culprits, and so he had to go. M. Painlevé, another good Frenchman, showed great weakness in attempting to mix home politics with judicial matters. He was quite willing to arrest those Republicans who attempted to shelter themselves behind M. Caillaux and his friends, but he sought at the same time to balance this bold action by implicating Léon Daudet, Charles Maurras and their Royalist friends. That manoeuvre failed, for M. Painlevé's good faith had been abused by political intriguers. The supposed Royalist plot was a mare's nest invented by corrupt police spies, and the result was M. Painlevé had to go.

M. Clémenceau, whose great speech against Malvy and his Boloist friends proved to be not mere words, but the most powerful action taken by any politician since the Dreyfus case, has certainly not accepted at his age—he is 76—the responsibility of power, to leave things as they were before. He is a man of action and his programme has been admirably summed up by himself in his paper *L'Homme Enchaîné* when he wrote a few days ago "The essential condition of any national life is a Government." And by government M. Clémenceau means a government composed of "a well-organised gang of workers"—to use his own expression—united with one object in view, to work and not to talk.

French Pacifists

M. Clémenceau may be trusted to apply this principle, not only to scavenging the dirty work of our French pacifists and other traitors, but also to strengthening the military policy of the country. Victories won over the enemy at the front or behind the lines are, after all, military matters; and it is quite proper that the man who is going to accomplish this task should be Minister of War as well as Prime Minister.

There is also another reason for rejoicing in the advent of M. Clémenceau to power. No living Frenchman knows better, and from personal experience, the English country, English institutions and English character. He has always kept in close contact with British statesmen of all parties. He has, in fact, been on terms of intimacy with rabid Tories as well as with ardent Liberals, and in no country of the world is the personal equation so influential in the conduct of affairs both political and private, as in England.

The Englishman differs from the Frenchman in this respect that for him the function is subordinate to the individual who exercises it. In France, however numerous ministers may be, there is always the feeling that *Monsieur le Ministre*, when he speaks officially, is as big as his office. And some of my friends on the other side of the Channel cannot understand why each new-comer in the domain of high politics, as for instance M. Painlevé with his two-months' tenure of office, does not carry as much weight in discussion with his English colleagues, as M. Briand or M. Ribot, whose faces, manners, gestures and modes of expression have become familiar.

In spite of his years, the new chief has all the alertness and the physical strength of a young man; and his marvellous intelligence has never worked with greater precision, clearness and logic. He is the strong man we have been waiting for since the beginning of the war, though some people will tell you he is nothing but an old cynic, who takes nothing seriously and whose only pleasure in life is to annoy his neighbours, and to oppose any project he has not proposed himself.

Let me tell a little story which if not true—and I have reason to believe it is true—summarises better than any long analysis the qualities of M. Clémenceau.

Two years ago he was visiting a very exposed part of the Front. An aide-de-camp was sent to him by the General in command of the sector begging him to withdraw to a place of safety. M. Clémenceau said to the officer! "Look over there at that poor child lying dead on yonder wires. He was young, most likely he loved life and love, and now he is dead. Why should I be frightened of death? I no longer love women and I am disgusted with men—I don't care if I die to-day." And M. Clémenceau, worthy of his nickname of "the Tiger," remained tranquilly where he was, within range of the enemy's guns.

How touching is this sympathy of the old man for the young dead soldier: how typical of his ever-present wit the manner of his retort; and, if I may say so, what ideal qualifications for a statesman in a time of great national danger and allurements. A man who is entirely impervious to the blandishments of life can no longer be taken in by the pretended virtues of men. He knows that humanity is mostly sublime or abject. But more than ever his heart is moved by the sentiment incarnated in the body of that young soldier fallen in defence of France, and the one thing which continues to flame in his soul is the passion for his country. Such a man must be the leader sent by Providence to save France, and with France, her Allies.

Venizelos and His Army

By Lewis R. Freeman

The presence of M. Venizelos in London makes this article dealing with him and the men he had rallied round him, when his fortunes were at the lowest ebb very apropos. There can be no question that this Greek statesman is the most outstanding personality in the Balkan States to-day. He has been faithful to his patriotic ideals through terrible crises and History will speak of him as the greatest Greek in modern times.

MVENIZELOS and the Venizelists had been having a bad time of it from the first, but the blackest hours of all were those towards the end of last April, when King Constantine was still strong in Athens, and before the Allies at Salonika had found it practicable or expedient to welcome them to a full brotherhood of arms. It was during this "darkest-before-the-dawn" period that I had my first meeting with M. Venizelos, a conventional half-hour's interview in the suburban village midway along the curve of Salonika Bay, where the Provisional Government had its Headquarters.

I had just come from Athens, where I had found the Allied diplomats still smarting under the memories of their ignominious experiences following Constantine's spectacular coup of the December preceding, and it was by no means the least of these who had told me point-blank that he could not conceive how it would be possible that Salonika should be returned to Greece after the war. Of course, it was the Royalist Government that my distinguished friend had had in mind when he spoke, but there was not much to indicate at that time that the Greece of Constantine and his minions was not also going to be the Greece of after-the-war.

It was with this state of things in mind that I mustered up courage and asked M. Venizelos offhand—remembering his well-known ambitions to found a Greater Greece, by extending Epirus north along the Adriatic and bringing the millions of Greeks of Asia Minor at least under the protection of the Government at Athens—if he felt confident of being able even to maintain the integrity of his country as it existed before the war.

"Not unless those of us Greeks who have remained faithful to the cause of humanity and our honour are ultimately able to lend the Allies material help in a measure sufficient to counterbalance the harm which the action of the Royalists has caused them," was the prompt reply. "And by material help I mean military aid. We must fight, and fight, and keep on fighting, for it is only with blood—with Greek blood that the stain upon Greek honour can be washed away. It is only our army that can save us, and that is why we have been so impatient of the delay there has been in equipping it and getting it to the Front. The one division we have in the trenches now, and the two others that are ready to go, are not enough, but they are all we have been able to raise so far. Thessaly is for us, and would give us two more divisions at least; but the Allies have not yet seen fit to allow us to go there to fetch them."

M. Venizelos spoke of a number of other things before I left him (notably of the extent to which the Russian Revolution and the entry of America had helped him in his fight to save Greece), but it was plain that the problem uppermost in his mind was that of wiping out the score of the Allies against his country by giving them a substantial measure of assistance in the field.

"Do not fail to visit our force on the ——— sector before you leave the Balkans," was his parting injunction. "There may be a chance of seeing it in action before very long, and if you do you will need no further assurance of the way in which we shall make our honour white before our Allies and all the world."

The Serbian and two or three other Armies have been worse off materially, but no national force since the outbreak of the war has been in so thoroughly an unenviable a position on every other score as was the Venizelos Army at this time. The Serbs and the Belgians had at least the knowledge that the confidence and the sympathy of the Allies were theirs. Also, they had chances to fight to their hearts' content. The Venizelists had scant measure of sympathy, and still less of confidence; and when their first chance to fight was at last given them, they were only allowed to face the foe after elaborate precautions had been taken against everything from incompetence and cowardice on their part to open treachery. That this was the fault neither of themselves nor of the Allies, and had only come about through the perfidy of a King to whom they no longer swore fealty, did not make the shame of it any easier to bear for an army of spirited volun-

teers who had risked their all for a chance to wipe out the dishonour of their country.

What for a while made it so difficult for the Allies to know what to do with the Venizelist army was the almost ridiculous ease with which, under the peculiar circumstances of its recruitment, it lent itself to spying purposes. All the Royalists or their German paymasters had to do to establish a spy in the Salonika area was to send over one of their Intelligence Officers in the guise of a deserter from the Greek army to that of Venizelos, and there he was. To send back information or even to return in person, across the but partially patrolled "Neutral Zone" was scarcely more difficult.

A Most Trying Position

How trying the situation of the Venizelists was, however, I had a chance to see one day when I happened to be at their Headquarters in connection with arrangements for my visit to the Greek sector of the Front. Their troops had acquitted themselves with great credit in some gallantly carried-out raiding operations, which must have made it doubly hard for them to put up with a new restrictive order then promulgated by the Supreme Command as a further precaution against the leakage of information to the enemy.

As I was about to take my departure, a copy of the new order was delivered to the Staff Officer with whom I had been conferring about my visit to the Front. He read it through slowly, his swarthy face flushing red with anger.

"Have you heard of this?" he asked, handing me the paper and controlling his voice with an effort. "No man or officer of our army is to cross the ——— bridge without a special permit from General Headquarters. It is only the latest in the long series of humiliations we have had to put up with. Just look at the way we stand. In Athens our names are posted as traitors who can be shot on sight. Here it isn't quite like that but—well (he raised his hand above his head and let it fall limply in a gesture of despair). All I can say is that the only officers of the Venizelist army to be envied are those whose names are recorded here (indicating a file at his elbow)." It was the death-list of a day's fighting.

Owing to the delay in issuing my pass in Salonika, I did not arrive at Greek Headquarters until the evening of the day on which the big attack had taken place, and it was daybreak of the morning following before I was able to make my way up to the advanced lines. The troops of Venizelos had taken all of their objectives and held them with great courage against such counter-attacks as the surprised Bulgars were able to organise against them. They had been busy all night "reversing" the captured trenches in anticipation of a determined attempt on the part of the reinforced enemy to retake them in the morning. The hilly but well-metalled cart-road along which I cantered with an officer of the Greek Staff by the light of the waning moon, had been thronged all night with the surging current of the battle traffic—an up-flow of munition convoys and reinforcements and back-flow of wounded and prisoners—but I could not help remarking the comparative quiet and absence of confusion with which the complex movement was carried on.

"Somehow this does not seem like the transport of a new army just undergoing its baptism of fire," I said to my companion; "I have seen things on the roads behind the Western Front in far worse messes than any of these little jams we have passed to-night. These men are as business-like as though they'd been at the game for years."

"So they have," was the quiet reply. "Our army, as recruited so far, is a new one only in name. The men who attacked yesterday were of the famous S—— Division, which fought all through the last two Balkan wars and gained no end of praise from all the foreign military attachés for its great mountain work. It was this division which scaled the steep range beyond Doiran and drove the Bulgars out of the Rupel Pass."

"The S—— Division"—"Rupel Pass!" Instantly I recalled how a British General, over on the Struma a few days previously, had pointed out to me a steep range of serried snow-capped mountains towering against the sky-line to the north-west, and told me that the feat of the Greeks in taking a division over it at a point where even the wary Bulgar had deemed it impossible, was one of the finest exploits in the annals of mountain warfare.

"I never saw troops go over with such *elan*," said a young French Lieutenant, after the first engagement in which Venizelos' men had taken part. "Some of them were so eager

to get at the Bulgars that they couldn't wait for the barrage to get out from under their feet, but dashed right on through it. Now if they will only hold against what is preparing over there for this morning, all will be well."

We found the two officers in the British Observation Post chuckling over the evening bulletin, which had just been delivered to them. "You have to read Sarrail's *Evening Hope* between the lines if you want to get at the real facts," said one of them. "It's what it fails to tell you that you really want to know. Now you might be able to gather from this that all of the Balkan Allies have been doing quite a bit of attacking during the last day or two at various parts of the Front from Doiran west to Albania, but you have to go between the lines to find that our shifty Bulgar friend over there gave most of them as good or better than they gave him all the way. It's sad, but true that in this, our 'great spring offensive,' as the papers at home have talked of it, the whole lot of us—French, British, Russian, Italian and even the Serb—have been fought to a standstill by the Bulgar. Far as I can see, the only gain we have to show for it is in the casualty lists."

I failed to see just what there was to chuckle about in such an interpretation of the glowing lines of the evening bulletin, and said as much.

"It isn't funny in the least," was the reply; "and it would seem still less so if we could see at close range some of the things that are lying out on a hundred miles of these accursed mountain sides as a consequence of what has happened. But what *did* strike us as rich was the fact that, of all the Allies, this little piece of the Venizelos army, which we have held in leash all winter while we made up our minds whether it would be safe to slip or not, is the only one of the whole lot of us that has taken all the objectives set for it."

A sporting instinct and a grim sense of humour—the readiness to admire a brave foe and the ability to extract amusement from discomfiture—are the two things that have conspired to make the British soldier so uniformly successful in treating those "twin impostors, Triumph and Disaster, just the same."

There was lightning in the sky, throwing into ghostly silhouette the line of the mountain ridge across the Vardar by the time we had pushed on along the communication trench to the Greek Observation Post on the extreme brow of the hill. Since midnight the enemy heavies had been coughing gruffly under the mist-blanket that overlaid the plain, dappling it with alternately flashing and fading blotches of light till it glowed fantastically like a lamp-shade of Carrara marble. Star-shells, fired with a low trajectory, popped up and dived out of sight again, throwing a fluttering green radiance over the white pall which swathed the battlefield.

The mist-mask must have fended the daybreak from the plain long after it was light upon the hill from where we watched, for it was not until the range of serrated peaks to the east of Doiran was all aglow with the red and gold of sunrise that the higher-keyed crack of the enemy's field-guns came welling up to tell us that the Bulgar was getting ready to go over the top. The flame-spurts—paling from a hot red to faded lemon as the light grew stronger—splashed up again the mist-pall as the jet of an illuminated fountain rises and falls, and down where the battered first-line trenches faced each other the dust-geysers of the exploding shells rolled up in clouds to the surface of the thinning vapours as the mud of the bottom boils up through the waters of an agitated pool.

For the space of perhaps two or three minutes the fog-bank swirled and curled in swaying eddies as the shells came hurtling into it; then—whether it was from a sudden awakening of the wind or through the licking up of its vapours by the first rays of the now risen sun, I never knew—almost in the wave of a hand, it was gone, revealing a broad expanse of trench-creased plain with a long belt of grey figures moving across it in a cloud of dust and smoke.

"It isn't much of a barrage as barrages go on the Western Front," said Captain X—half apologetically; "their artillery won't do much harm to us, and, I'm afraid, ours not much to them. But if it's but a second-class artillery show, I still think I can promise you—if only the Bulgar has the stomach for it—a lively bit of hand-to-hand fighting. Do you see those little winking flashes all along where the infantry are moving? Some of them's from bayonets, but the most from knives. A great man with a knife is the Bulgar. Did you ever hear that song about him they sang at a revue which the British 'Tommies' gave at Salonika? :

"I'm Boris the Bulgar,
The Man with the Knife;
The pride of Sofia,
The Taker of Life.
Good gracious, how spacious
And deep are the cuts,
Of Boris the Bulgar,
The Knifer—"

"Now for it! Look at that!" I never did hear just what it was that Boris was a knifer of, for at that juncture the two barrages—having respectively protected and harried to the best of their abilities the advancing wave of infantry down to within a hundred yards or so of the Greek trenches—"lifted" almost simultaneously on to "communications," and that lifting was the signal for the opening of the climactic stage of the action. Without an instant's delay, a solid wave of brown—lightly fringed in front with the figures of a few of the more active or impetuous who had out-distanced their comrades in the scramble over the top—rose up out of the earth and swept forward to meet the line of grey. The gust of their first great cheer rolled up to us above the thunder of the artillery.

"Now for it!" repeated X—, focussing down his telescope and steadying himself with his elbows.

I do not attempt to account for what happened now; I only record it. It may have been that the Allied artillery had wrought more havoc in that advancing wave of men than had been apparent from a distance, or it may have been that the enemy artillery had done less to the entrenched defenders than it was expected to do; at any rate, the line of grey began to break at the first impact of the brown.

The Greek Staff

The Greek Staff shared a round bowl of a mountain valley a few miles back from the front lines with a clearing station. The equipment of the little hospital had mostly been provided by the British Red Cross, but the Venizelists had made a brave effort to furnish the staff themselves. There were two French-trained Greek surgeons, a Greek matron, Greek orderlies, and two Greek nurses. Since the attack began there had been work for a dozen of the latter, but, as it had been impossible for the women of most of the Venizelist families to get away from Old Greece, no others were available. An English nurse, who had marched in the retreat of the Serbians, and a French nurse from a Salonika hospital had volunteered to step into the breach, and these five women were courageously trying to make up in zeal what they lacked in numbers.

Madame A— had asked me to drop in at the nurses' mess for luncheon in case I got back from the trenches in time, and this, by dint of hard riding, I was just able to do. Three or four powerful military cars drawn up at the hospital gate indicated new arrivals, but as to who they were I had no hint until I had pushed in through the flap of the mess tent and found M. Venizelos seated on a soap-box, *vis-a-vis* Madame A— at a table improvised from a couple of condensed milk cases. At the regular mess table, sitting on reversed water-buckets, were three French Flying Officers and a civilian whom I recognised as the private secretary of M. Venizelos. Two nurses were just rising from unfinished plates of soup in response to word that a crucial operation awaited their attendance.

This was, I think, one of the strangest little "banquets" I ever sat down to. Everyone travels more or less "self-contained" in the Salonika area, and whenever a party is thrown together the joint supplies are commandeered for the common good. The mess menu was a simple one of soup, tinned salmon, rice and cheese, but by the time M. Venizelos' hamper had yielded a box of fresh figs, a can of the honey of Hymettus, and a couple of bottles of Cretan wine, and the French officers had cognac, some tins of *flageolet* for salad and a tumbler of confiture, and the English nurse had brought out the last of her Christmas plum-cake, and I had thrown in a loaf of Italian *pan-forte* and a tin of chocolates, the little crazy-legged camp-table had assumed a festal air.

A number of toasts were proposed and drunk, but no one spoke of the nearer or remoter progress of the war. M. Venizelos adverted several times to the wonder of the spring flowers as he had seen them from the road, especially the great fields of blood-red poppies, and I overheard him telling Madame A— some apparently amusing incidents of his early life in Crete. But it was not until, the banquet over, he had settled himself in his car for the drive to Salonika that he alluded to any of the things with which his mind must have been so engrossed all the time.

"So you thought that our troops had all the best of the enemy this morning?" he said with a grave smile as he shook my hand.

"Incomparably the best of it," I answered.

"Then perhaps you will understand why I felt so confident that the Bulgars would not have come into the war if they had known that Greece would stand by Serbia. And you will also understand why I feel so confident that our military help to the Allies will be a very real one, perhaps enough of a one even to save Greece from herself."

This was, I believe the latest occasion on which M. Venizelos visited his troops at the Front.

Chinamen in France

By Charles Watney

BEHIND the fighting line you find men of innumerable races and nationalities, employed not as combatants but on purely labour duties. By far the most numerous are the Chinese.

We were not the originator of the idea of employing Chinese labour in France. The French were the pioneers. Encouraged by their experience in utilising the services of men from their own Colonies, they proceeded to enrol them with the acquiescence of the Chinese Government in Northern China, and it is also from the north that we ourselves draft them to France. The Chinaman does not mind long journeys and long periods of voluntary expatriation. He signs on for a three years contract, whereas the South African native for domestic reasons limits his period of service to one year. This is a strong point in the former's favour. Another point in his favour is that he is a hardy traveller.

It must be an interesting pilgrimage when some thousands of these men set out for Europe, and it must be a remarkable experience. In the first place they have been carefully selected, and apart from a few elderly individuals they are all of a fine physique. But at the same time in a long journey maladies are necessarily contracted or developed. In that case, the pilgrimage drops the sick people for hospital attendance on the way and when they have recovered they are attached to the next party passing through. Thus, some parties arrive less in strength than when they started, while others arrive considerably larger. These maladies are nearly always trivial; an attack of mumps held a party up at one spot for quite a long time. Up to the present, no mishap whatever has befallen any, and the mortality is trivial. One of these Chinese labourers who recently died in a British town was accorded a military funeral.

One must pay a tribute to the buoyancy and the imperturbability of these men. They have no break in their long journey, yet when I saw them—as I did the other day to the extent of some two or three thousand—they were all cheerful and well provided with tomtoms and other instruments of music. Most European critics wonder whether their clothing is sufficiently thick to protect them against cold; it seems to be standardised, for every man wore a long brown cloak over his usual Chinese dress, which apparently consists of both light summer and thick padded winter clothes worn simultaneously, the latter next to the skin. Their shoes seem the least suitable, but this makes no difference, for every man is supplied with a pair of boots just the same as those worn by the British soldier.

This contingent of immigrants landed in France in the mid-afternoon; late the same evening a train dropped them at a great Chinese depot miles and miles behind the fighting front and they passed the first night in bell tents. The next morning showed them a type of camp with which many, having laboured in South Africa, are familiar. On one side of a wide road, evidently remodelled extensively by the military, since the spot lies well off the beaten track, has been built a large mixed camp, one-third of tents and two-thirds of permanent structures of the normal military type which the army carpenter is running up all over Northern France.

This camp possesses features which are not found in the other Chinese camps in France. It is the great clearing depot for all arrivals, and its administration is testimony of the thoroughness, care, and patience with which these immigrants are looked after. They spend but a short time in the depot, a few days at the most, and sometimes if the incoming numbers are very large, as they occasionally are, only just sufficient time for record and refitting purposes. In the morning after their arrival each man is individually submitted to a very minute medical examination, more especially for trachoma and to a lesser degree for pulmonary troubles.

Naturally the one great object in a camp of this nature and in dealing with a race prone to certain diseases, is to detect at the earliest possible moment the outbreak of even a single case. The medical attendance and supervision of the men, therefore, is notably thorough and perfect. Prior, however, to the medical examination each man has to be identified. The men have names, which are known to the authorities, but in view of their complexity and difficulty of pronunciation each is known, and for all practical purposes identified, by a number.

It appears that astute men having signed on in China for the Government terms have found it more profitable to stay at home and send a deputy, whom they undertake to pay at a rate which, needless to say, is very much under the standard of

the British Government. This misplaced ingenuity must be ceasing to be popular, since it is always detected, and the substitute may, if fit, be kept on; but the original exploiter of cheap labour never benefits in the least.

Love of New Boots

When the men leave the doctor—and the vast majority arrive in excellent health—they are taken in hand by the Quarter-master of the Stores. It is his job to fit them out with boots, vests and blankets, and his department keeps such a minute record of each individual transaction that if at a later date any labourer suggests he has not been properly and adequately fitted out, his statement can be at once investigated. Occasionally one has heard reports that some of the men suffer from lack of boots. As a matter of fact, they may suffer in this way, but it is their own fault. The average Chinaman is by no means an innocent and unsophisticated child of nature. He has been known to sell his boots for the sake of the few dollars he may get on them, and he will then return and blandly ask for another pair. He has too a weakness for new boots. Sometimes some of the boots have been stout secondhand ones, thoroughly repaired, but if one man knows that another has received a pair of new boots, his one object is to work back the old ones on the stores and try and persuade them to give him a new pair. In fact, two men whose request to this end had been turned down, retired to the background to take council, and presently one returned with two left-foot boots, remarking that a mistake had evidently been made in the issue. But the fraud failed.

Having obtained his outfit, the man is ready for work, but normally, unless it be camp routine duty, he is not called upon to do anything for two or three days, until, so to speak, he has "found his feet." He therefore devotes himself to getting his outfit in order, repairing own clothes, etc., etc. He soon finds that the Government has taken him thoroughly in hand, so that he has to worry about nothing. His rations are up to the standard of the soldier, and in one or two respects even better. He is, if he desires, allowed to prepare some of his own food in his own way, this being especially the case in regard to the bread or bread cakes which every Oriental likes. The bulk of the meals are, however, prepared by the authorities on European lines, but with Chinese cook-helpers, in the usual field kitchens. Whatever may have been their home diet, new arrivals speedily accustom themselves to solid European fare, which is probably infinitely better than that with which in peace time they are familiar. No scruples are urged in respect of any type of food. There is an Expeditionary Force Canteen on the premises, where they can buy all the articles which the soldier usually purchases, and various forms of food popular in the East.

Meantime, the authorities devote themselves to sorting out the new arrivals. There are always a number of men in a Chinese camp who have knowledge of a trade. Some are able to attend to machinery, others make good cobblers, or can successfully perform many of the little specialised duties which have always to be attended to in an army. They are set aside for special work as it arrives, while the rest—day labourers—are grouped in companies in anticipation of requisitions which may come down at any moment from any part of the British line. For this purpose local camps have to be built for these Chinese labourers very much on the lines of the depot camp. There are already nine in existence, and the number grows daily since, by the end of the year, there may be well 100,000 Chinese labourers in France.

Even the rough type of labourer does well. The Chinaman makes a good show in landing or loading cargo. His champions claim that he holds the record for rapid work at sea-ports, and for road work he can challenge comparison with any race. So, when the requisitions arrive at the depot, the men are at once sent off, always under a British officer speaking their language, and, in addition, overseers of their own nationality, all of whom know some English, and many of whom a good deal. It is by no means uncommon to find Chinese who have served, for instance, in the old Wei Hai Wei Regiments, and who have a substantial acquaintance with military discipline.

Is the work popular? You cannot go to France and come to any other conclusion. In the first place, the rate of pay is good. In addition to the free clothes, free food and free accommodation, each man receives a franc a day, while an allowance of ten Mexican dollars a month is

paid to his family at home. It would not be surprising to learn that the work is equally popular in China among the families whose men are thus at the front. Nor do the ten dollars probably represent all the money that is distributed at home. A Bank is being established so that the

men can remit money home, but one fancy sometimes that the temptations of European articles of dress and food absorb a portion of the savings. The one franc a day is only the minimum rate paid to unskilled men. Those who have any special trade aptitude, can earn a great deal more.

A Great Experiment

By Jason

This article describes an experiment in the self-government of an important industry, which may conceivably effect in the future almost a revolution in the industrial world.

THERE are certain economic calamities that the mind associates with war. Chief among them are high prices, wild fluctuations of trade, spells of unemployment. In every war a few men are enriched and in every war the shadow of ruin and destitution broods over nine homes out of ten. When the skies fell in August three years ago, there were many whose minds went back to the last great European war with its terrible record of degradation and misery. The Industrial system has connected the whole world in a series of relationships so delicate and penetrating that any violent disturbance must react on every community that buys and sells. Professor George Unwin has shown in his book on *Industrial Organisation in the Sixteenth Century* that the handicraft or guild system is associated with the town economy, the domestic or commission system with the national economy, and the factory system with the world economy. We saw what this implied in the case of the war with Napoleon when the Industrial system was scarcely out of its cradle. A nation that is involved in the world economy is subject to vicissitudes that do not affect a community that has not passed beyond the earlier forms. The more elaborate that system, the greater the consequent chaos. Hence it looked to most people in 1914 as if the second great European War would follow the course of the first, inflicting all the same disturbance only in greater degree.

This has not happened. This is not the place to discuss the various causes that have made part of that forecast false. Some of them are quite independent of the sagacity of man; some of them mark a return to more primitive conditions than those we associate with the Industrial system. But in some degree our escape from these evils has been due to the readiness to learn the lessons of the war, and some of these lessons are lessons for peace. Not the least significant experiment in this connection is the experiment of the Control Board in the Woollen and Worsted Industries.

The control applies to both these industries, for they are both concerned with the requirements of the army, and they are, of course, very intimately associated. Roughly speaking, worsted differs from woollen in its raw material and in the preparation that material undergoes. The worsted mill uses long wools ranging in length up to 14 or even 17 inches; the woollen mill uses short wools, the fibres of which vary from $\frac{1}{4}$ inch to $2\frac{1}{2}$ inches. The wool used by a worsted weaver has been combed before it is spun. Combing is the process by which the long wool called the "tops" is separated from the short, the "noils." The wool used by a woollen weaver is carded—that is, whereas in combing the fibres are made to lie straight and parallel, in carding they are made to overlap one another. Worsted fabrics are generally lighter and finer than woollen. They are made, for example, into men's dress suits, and into certain serges. Woollens are used for fine broadcloths, winter overcoats and tweeds. The worsted industry is strongest in Bradford, Huddersfield and Halifax; the woollen in Leeds and the neighbouring districts, in the West of England and in Scotland.

It is characteristic of the woollen and worsted industries that the family type of business is prevalent, and the normal mill is comparatively small. There are rather under three hundred thousand persons engaged in the industry, and the average number of workpeople in a woollen mill is 100; in a worsted mill 200. Cotton is much more highly organised from every point of view. As Dr. J. H. Clapham points out in his admirable book on *The Woollen and Worsted Industries*, "It is never possible to gauge the general prosperity of worsted spinning by comparing the balance-sheets and dividends of scores of limited mills, whereas this is regularly done in the case of Lancashire cotton spinning." Organisation among employers has developed more slowly in wool than in cotton, and trade unionism at the outbreak of war, outside a few craft unions, was lamentably weak. This general contrast was partly due to history. The factory system swallowed up the cotton industry much earlier than the woollen. Even so

lately as thirty years ago, handloom weavers were still an important body of men in the small towns and villages round Leeds, Huddersfield and Dewsbury.

One other general fact about the industry must be grasped if we are to appreciate the task that the Government undertook when it set to work on this scheme of control. The worsted industry is very highly specialised. The wool merchant buys wool, blends and sorts it. He then sends it to a wool-comber who combs it into tops. The tops are sold to a spinner, who spins them into yarn and sells his yarn to the manufacturer. The yarn is then woven into pieces, in which form the cloth is sent to the dyer. In the woollen industry there is rather less specialisation, for carding, spinning and weaving are generally carried on in the same mill. It is clear from this account that the industry is highly complicated with a number of different interests, and that the task of organising and controlling it presents special difficulties.

The necessity for control of some kind became evident in the early part of last year, when the Government realised that unless some check was put upon prices, the cost of clothing the army would be ruinous. In the old days the army got what it needed by competitive tender, but the conditions were now quite abnormal. The needs of the army in khaki, flannel and blankets were on a stupendous scale, and the export trade was stimulated by the immense requirements of our Allies. The War Office Contracts Department, accordingly, determined to organise production for its own needs, taking power by an Order in Council under the Defence of the Realm Regulations, to requisition the output of any factory on terms based on the cost of production plus a reasonable profit. They arrived at this figure by examining the books of different firms, and calling on manufacturers to supply detailed information as to their output, their cost of production and the profits they had earned. Hence at the outset an important principle was introduced, for the different sections of the trade affected were called on to nominate representative committees and the "conversion costs"—that is, the scale of payment prescribed for a particular operation, based on the cost of that operation—was agreed with these committees. That is, an industry in which organisation was at the time in a most elementary condition, was obliged to choose representatives and to take a wider view of its interests in order to secure a proper hearing from a Government Department.

So far the Government had merely arranged to get a certain amount of work done by the manufacturers at a reasonable rate. This volume of work was a great and increasing proportion of the trade as a whole, for it soon came to include not merely the requirements of our army, but all the requirements of our public services and the requirement of the Governments of our Allies as well. But before long it became clear that the control was too limited, for the price of raw wool was advancing at an alarming rate and this rise of price was a warning that the supply of wool was not equal to the world's demands. In 1915 there was a serious shrinkage in the production of wool in Australia, where drought had reduced the sheep flocks from 82 millions to 69 millions, and also in South America, where cattle raising and wheat growing were developing into powerful rivals. Meanwhile, America had removed her import duties on wool and her consumption was rapidly increasing. The War Office Contracts Department realised that as a measure of national safety it was essential to secure the raw material that was needed for our consumption and the consumption of our Allies. Accordingly, the Government decided in May, 1916, to buy the Home Clip. They divided the country into districts, appointed experienced wool buyers as officials to superintend the transaction, and for the detailed purchase they employed wool merchants working on commission. The prices were roughly 35 per cent. above the prices ruling in July, 1914. A still more important step was taken in the autumn, when the Government decided to buy the whole of the Australasian Clips. In this case the arrangements were made with the Colonial Governments who acted as the Government's agents. Two-fifths of the wool is cross-bred, the best for military purposes, and the rest merino.

These transactions entirely altered the Government's relations to the trade, for they put the supplies of the trade in

the hands of the Government. The Home Clip accounted for a ninth part of the consumption in 1915; the Australian clips represent half the world's exportable resources. The Government had, therefore, to arrange for distribution to the industry, and to provide not merely the wool that was needed for Government cloth, but the wool that was going to be passed on to the civilian trade. It is obvious that this responsibility introduced all kinds of delicate questions. For one thing, there was the question of distribution. The wool that the Government did not require was to be sold, but if the supply was less than the demand, on what principle was it to be assigned? At the time, the state of the foreign exchanges gave a special importance to the export trade, and priority was accordingly given to the needs of that trade. But the Government had to consider, not merely the distribution, but the economy of supplies, complicated as it was by the general difficulty of tonnage. The Government had to secure the nation against the risk of a failure of supplies and for this purpose it was necessary to regulate the consumption of wool by the trade. Here were two problems full of material for dispute.

The Government took measures to facilitate the execution of its task. A Department was set up in Bradford, men of experience and standing in the trade were enlisted as Government officials, a Wool Advisory Committee was formed representing different sections of the industry, and trade unions, as well as employers' associations. But the early proceedings of the Department provoked resentment and suspicion in the trade, and the columns of the *Yorkshire Observer* and the *Yorkshire Post* during the summer months reflect the agitations and the discontents of the industry. There is no part of the country where bureaucratic control is rejected with greater dislike, and so far the scheme was in its essence bureaucratic. The hard-headed Yorkshireman is the last man in the world to accept dictation from an official. Mr. H. W. Forster, the Financial Secretary to the War Office, visited Bradford, and addressed critical and even hostile meetings. Deputations went up from Bradford to London. It looked as if the trade were irreconcilable, and the prospects of any effective co-operation seemed almost desperate. The situation was saved by the offer of the Department to set up a Board of Control, and thereby enable the industry itself to regulate the working of the scheme, subject only to the satisfaction of the essential requirements of the Government. The Board was formed in September, and its powers were defined by Order in Council the same month.

A Controlling Board

The Board consists of 33 members, of whom eleven are Government officials, many of them manufacturers or merchants in the present or the past. Thus, Mr. Charles Sykes, the Controller, who is Chairman of the Board, and a very successful chairman, has been closely associated with the industry, and he speaks with an intimate knowledge and experience of its circumstances and needs. Most of the eleven official members are in the same case. Eleven again represent spinners and manufacturers. Three are chosen by the West Riding Spinners' Federation, three by the Woollen and Worsted Trades Federation, and one each by the Scottish Manufacturers, the West of England Manufacturers Association, the Hosiery Manufacturers, the Low Wool Users (*i.e.*, men who make blankets, etc.), and the Shoddy and Mungo Manufacturers' Association. Lastly, the Trade Unions have eleven members representing the several craft unions and the General Union of Textile Workers.

The setting up of the Board is an immense event in an industry where individualist tradition is so persistent. The different groups of interests have been compelled to co-operate, and to recognise that the industry as a whole has interests and responsibilities. And the work of the Board is of the most important and delicate kind. The War Office reserves to itself certain powers. It decides the amount of raw material to be maintained for military purposes; it determines the terms and conditions of Government contracts; keeps in its own hands all financial arrangements and carries out all the earlier processes such as the cleaning, blending, and combing of the raw wool. It is not until the wool has reached the topmaking stage that the control of the Board begins. At that stage, subject to the above reservations, it is the duty of the Board to regulate all allocation of wool, tops, and other products, and by-products, in such manner as:

- (a) To secure the most efficient execution of Government orders for supplies of woollen and worsted goods.
- (b) To employ to the greatest advantage the labour, machinery and skill now engaged in the industry.
- (c) To keep in full use the greatest possible proportion of the machinery at present employed in the trade.

Its actual duties differ in the case of wool for military

requirements, and of wool for the civilian trade. Contracts for the execution of Government orders are allocated by a Committee; the spinners and manufacturers are paid on the basis of conversion costs, and there is no element of profit making. It is laid down in the Order-in-Council that the officials of the Department shall obtain the advice and concurrence of the Board in so far as is necessary to secure the most efficient and equable distribution as between districts, trades, groups, and individual firms, and to secure all possible regularity and continuity in production. Thus, the responsibility for organising the execution of Government contracts in such a way as to promote the interests of efficiency, equity and continuous employment is thrown upon the Board.

The Civilian Trade

In the case of wool for the civilian trade the Board has full and direct responsibility for the distribution of supplies. "The Board is empowered to allocate as between districts, trades, groups, and individual firms the quantity of wool and tops available for civilian trade." The Board discharges this duty by setting up a number of rationing committees chosen by the spinners and manufacturers, in some cases with Trade Union members, with a Joint Rationing Committee in control, on which the several district Committees and the trade unions are represented. These Committees ascertain the main facts about the needs and capacity of the different mills and the different districts and the wool at the disposal of the Board is distributed in proportion. Such a task can only be carried out by the representatives of the industry; for no Government Department can command the confidence of the men who have to make the sacrifices necessary in the interests of justice and of public safety.

The industry thus takes into its own hands a function which at first the Government attempted itself to discharge; a function that in other times has been left to the play of economic forces, with results that have brought ruin and unemployment in many districts and thousands of houses. Instead of a scramble in which some men might make fortunes and others pass into the bankruptcy court, with workpeople here working overtime and there walking the streets in hunger and misery, we have an industry regulating its fortunes with a view to the common good. It is recognised that there is something better than economic law as the arbiter of men's fate. The conscious efforts of a set of men to adapt themselves to a crisis in such a way as to check its disturbing consequences mark a step of the first importance in the reconstruction of industry on humane lines. It is difficult to calculate the amount of pain, degradation and lasting mischief that would have been averted if there had been such a system in force a hundred years ago.

Nor does this exhaust the duties of the Board. A most important clause in the Order directs them to take all possible measures to protect the interests of the home consumer, and to secure equable treatment as between various branches of the industry. The industry comprises different sections that are often in conflict; merchants, spinners, manufacturers. The merchant may be in a position to exploit the spinner; the spinner to exploit the manufacturer. The Board presides like Olympus over all these interests, and forces them to accept a new moral discipline in place of the old economic struggle. Its very existence has a significance that can be scarcely exaggerated.

Meanwhile, the consumer is not forgotten. "All possible measures are to be taken to protect him." And it speaks well for the vigour and the resolution of the Board that within a few weeks of its creation Mr. Charles Sykes can announce to the press that a scheme is shortly to be produced for checking profiteering in the civilian trade, and for providing a standard cloth at a fixed price. This does not mean that we shall all have to wear clothes of the same colour and pattern if we want to escape the high charges of our tailor. What it means is that manufacturers will be invited to make a certain quality and size of cloth, for which they will receive payment on the basis of conversion costs just as if they were making khaki. The pattern and the colour will vary from one manufacturer to another. In this way the home consumer will be able to buy clothes at a reasonable price of a guaranteed quality. A full and interesting discussion of the scheme is now proceeding in the columns of the *Yorkshire Observer* where representatives of the different interests are giving their views.

As a scheme for carrying the nation through a crisis the Board of Control is a most interesting and happy experiment. But it is infinitely more than this. It is a spectacle of a self-governing industry acquiring a new corporate spirit, a larger appreciation of the rights and duties of the industry as a whole, a new sense of the danger of uncontrolled economic forces, and a new consciousness of the place and share to which the workpeople are entitled in the government of the industrial world.

Life and Letters

By J. C. Squire

Lord Morley's Recollections

NO living man has had a more various life or seen more of the things that are of permanent interest than Lord Morley (*Recollections*, Macmillan, 2 vols., 25s. net), and even two thick volumes of reminiscences leave us with plenty of questions to ask about things that are omitted. He was in the centre of the mid-Victorian Liberal movement and sat at the feet of Mill, talked with Mazzini, knew Victor Hugo. He was prominent with Huxley in the theologico-scientific controversies which followed the publication of Darwin's speculations. He was an intimate of George Eliot, and Matthew Arnold, and lifelong friend of George Meredith; he watched the birth of United Italy, was Mr. Gladstone's right-hand man during the Home Rule struggles, and lived to effect his greatest positive political achievement in the 1906-10 Parliament, and to resign a seat in the Cabinet at the outbreak of the present war. His index, therefore, contains a most extraordinary list of names, and only the most cursory survey of the book is possible.

* * * * *

The earliest chapters deal mainly with great figures of the last century. There are character-sketches of many of them, and little pictures which show both their merits and their defects. "I have never known," says Lord Morley,

such high perfection of social intercourse as the Thursday dinners at the Priory in days when society let her (George Eliot) alone. The guests were always the same, understood one another, spoke the same language, Spencer, Browning, Congreve, Theodore Martin, Harrison; talk of serious things without solemnity; nobody wanting to shine or to carry a point or to interject a last word; all kept in sympathetic play by Lewes's sparkling good humour.

Not all these reunions, however, were so perspicuous.

The only time that I can recall anything like monologue at Mill's table, Spencer was the involuntary hero. The host said to him at dessert that Grote, who was present, would like to hear him explain one or more of his views about the equilibration of molecules in some relation or other. Spencer, after an instant of good-natured hesitation, complied with unbroken fluency for a quarter of an hour or more. Grote followed every word intently, and in the end expressed himself as well satisfied. Mill, as we moved off into the drawing-room, declared to me his admiration of a wonderful piece of lucid exposition. Fawcett, in a whisper, asked me if I understood a word of it, for he did not. Luckily, I had no time to answer.

But, as a rule, it is a picture of complete harmony, mutual understanding and general disinterestedness that Lord Morley presents; broken only by his sorrow that Mill should have elapsed into Manichæism and Sidgwick into Spiritualism, and by Sidgwick's rude observation, which here comes in like an intruder, that Comte and Spencer had a "latuous self-confidence." On the whole that age and that circle is viewed by Lord Morley much as our first parents may be presumed to have viewed their lost Eden. Not all will agree.

* * * * *

Of Mill Lord Morley writes with a depth of affection equal to that which he felt for Meredith and Chamberlain. Chamberlain draws from him the warmest and longest personal tributes of all: one is tempted to wonder whether when, in old age, Meredith issued a violent manifesto against Chamberlain in which unfavourable allusion was made to his nose, Lord Morley endeavoured to reason with him. He suggests Chamberlain's intellectual limitations; but he says that he had a remarkable eye for facts actually under his observation, that he never maintained any cause in which he did not ardently believe, and that the accusation of cynicism commonly made against him had no more foundation than his habit of sarcasm. Of men who became prominent at a later day he writes with a special warmth of Campbell-Bannerman, whom he describes as a man full of common sense, devoid of self-assertiveness, a remarkable instinct for the right thing to do, and a most successful Chairman of Cabinet. His political reminiscences are in some respects not so full or so novel in content as one had hoped. He throws less new light upon the history of the Irish Question than the biographers of Sir Charles Dilke have done, and his account of his own activities in Ireland does not convince one that he was a great administrative success, though he is scarcely unique in that. But there is one large section of the book which, for exhaustiveness and frankness, exceeds anything in any modern book of this kind. That is the section which gives the history of Lord Morley's régime at the

Indian Office, and particularly of his Indian Reform Scheme. In his letters to Lord Minto, in notes and comments, he gives an exhaustive account, full of what are called indiscretions—(i.e. truths conventionally kept for posterity)—about men and measures, and full also of illustrations of his own political knowledge and sagacity. No Viceroy can ever have received such remarkable letters from a Secretary of State. They are full of vivid detail and penetrating observations about things in general; and the evolution and progress of the Reform Scheme itself is exhibited upon a stage. We see all the conflicting forces at work. The Viceroy is sympathetic but cautious, in view of the prevalent unrest, and inclined to rather more drastic action than Lord Morley was inclined to agree to. The Secretary of State wrote long friendly lectures expounding the basis of Liberal principles, delimiting the boundaries of repression and explaining the need of accompanying firm administration with reasonable concession. Meanwhile, he pushed on with his plan, whilst Indian extremists and their sympathisers in England denounced it as hopelessly inadequate, Anglo-India attacked it as revolutionary, some of his own colleagues were tepid, and the Upper House was very doubtful. As we watch the play of all these elements, and others, we cannot but admire the persistency, coolness and tact with which Lord Morley stuck to its measure and got it through uninjured.

* * * * *

It is an impressive book. When one closes it one has travelled a long way, seen many men and many things, passed through the heat of many controversies, and left their dust behind one on the road. One's fellow traveller and guide has been a man more than ordinarily certain of himself, of what is known and what is unknown, of what is wise and what is not wise; capable of understanding doctrines that he opposes, but never in danger of succumbing to them; abnormally immune against change, but catholic in his interests; austere, but escaping frigidity; incapable of giving expression to a fever of emotion, but diffusing a mild warmth which comes from that organ which his school, with the loftiest of intentions, rather tended to starve. His political creed, whatever its imperfections, was a noble one as far as it went; he has remained faithful to it and, looking backward, he seems to find nothing with which to reproach himself. He says that the period between Waterloo and Sedan was the greatest and finest period of modern history. It is disputable. He himself says, in another connection, that Pope Paul III., was "spinning no cobwebs when he admonished his Council of Trent that Belief is the foundation of life, that good conduct only grows out of a right creed, and that errors of opinion may be more dangerous even than Sin." And it has possibly occurred to him that his generation was more fertile in "honest doubt" than in creeds with life in them. He ends with the admission that it might fairly be asked whether the Darwins, the Spencers and the Renans, have left the world better than they found it; whether "their influence has been so much more potent than the gospel of the various churches." These questions he leaves unanswered:

These were queries of pith and moment indeed, but for something better weighed and more deliberative than an autumn reverie.

Now and then I pause, as I sauntered slow over the fading heather. My little humble friend squat on her haunches, looking wistfully up, eager to resume her endless hunt after she knows not what, just like the chartered metaphysician So to my home in the falling daylight.

There is the touch of artifice, even of sentimental artifice, there; but it makes an effective close to what has gone before, and an effective commentary upon it. The rationalist is left under the stars as puzzled as the others, and a good deal colder. But one cannot begin discussing here. One can only say that Lord Morley's book is the most eloquent and comprehensive exposition that exists of the Agnostic Liberalism of the nineteenth century; that it is extremely valuable in parts as an historical record; that it gives the picture of a laborious life, always dominated by the duty of serving mankind; and that the production of such a book at eighty must long remain one of the most remarkable feats of green old age.

Copies of "The British Firing Line Portfolio" containing a series of Engravings in Colour by Captain Handley-Read and forming a wonderful record of the Battle-area, may be obtained, price 5 guineas each, from the Leicester Galleries, Leicester Square, W.

HARKING back to the very strenuous and critical days of the original Expeditionary Force—the days after the Marne, when the men of the old army waited patiently for the new armies to train and come out, one is struck by the difference in the estimate of the enemy, and also by the equipment of that wonderful old army. Major Corbett-Smith, in a very salutary chapter on enemy atrocities, points out that it was not till after the Marne and the advance to the Aisne that the British troops began to realise what manner of men were these Germans whom they faced, for on the great retreat they had left behind them villages and towns untouched, but, as soon as they returned on the tracks of the Hun, they began to see unbelievable things—there had been no *Lusitania* sinking, then; Louvain might be an exaggeration, and Rheims was still untouched. But these sights were undeniable. Very sanely Major Corbett-Smith comments:

I have remarked that it is the depravity of a whole nation rather than the individual excesses of an Army which is responsible for these things. A national army reflects the spirit of the nation. The German Army was, at the outbreak of war, just such an army as Britain in 1916 had in the field. Representative, I mean, of the nation as a whole. It was not a select body of professional troops such as ours was. And it was that national army—and, through it, the German people—which was guilty of those incredible outrages against all laws human and divine. . . . What purpose will be served by a German revolution? The German people remain.

This he sets as a warning to those who expect, in the day of reckoning, that punishment of the German rulers, apart from the people, will be sufficient—it is the nation as a whole that is perverted in instinct, guilty of the enormous crime.

* * * * *

In the matter of the equipment of the old army, Brigadier General Count Gleichen, in his *Doings of the Fifteenth Infantry Brigade*, remarks that "it does indeed seem extraordinary now that in those strenuous days of 1914 we had only about three machine guns to two battalions. Nowadays we should have at least twenty." And Major Bryan Cooper, in his *The Tenth (Irish) Division in Gallipoli*, a record worthy almost to rank with the *Iliad* as a catalogue of the incredible exploits of mortal men, makes the same point when he tells how Irishmen held on and died under a rain of Turkish bombs, having no bombs themselves with which to reply. One hero caught the bombs as coolly as if in a cricket match, and hurled them back to explode in the Turkish lines, till one exploded as he caught it and sent him to the Valhalla of heroes. These three books are epic.

* * * * *

Coming forward to the doings of the Territorials, *Twenty-two Months under Fire*, by Brigadier-General H. Page-Croft, gives the stories of Zonnebeke, Givenchy, the battle of Festubert, Neuve Chapelle, Loos—all the great actions of that time which now seems far off, before the machinery of to-day had come to supplement the courage which has not failed since the first Expeditionary Force set out. This author takes his story on to the battle of the Somme, and to Pozieres, and he sees as the great lesson of the war a realisation of the fact that the nations of the British will stand together.

"Scattered as we are we can still claim similar qualities of steadfastness of purpose, courage against all odds, greatness in adversity," and "severally we could not have lasted the course, but together we shall win through." The whole of this book is a tribute to "that great-hearted gentleman, the British soldier," and that is why it cannot be other than a worthy record of heroism, illustrated by stories which go to prove that in the grimmest struggles the sense of humour is never lacking from either Regulars or Territorials.

* * * * *

In rather lighter vein Ian Hay has continued his record of life with the Territorials, *Carrying On—After the First*

Hundred Thousand. Sergeant Mucklewame—no longer a mere private—is again to the fore, as are Wagstaffe and other old friends of this author's preceding account of training and war. It was evident, when *The First Hundred Thousand* was published, that there were many good stories of the doings of these worthies yet untold, and here they are—the author has decided not to make a third volume, and thus this second ends with Mucklewame out of it, Bobby about to be married, and Wagstaffe commiserating him on the sad event. It is an old saying that a sequel is never a success, but Ian Hay proves the reverse.

* * * * *

Another "war book," this time devoted to the doings of the youngest service, is *Glorious Exploits of the Air*, in which Mr. Edgar Middleton has collected some stories of the work of the R.F.C. by way of material, and woven them into a book from which it is possible to gain some idea of the multifarious duties of the flying man. A point worth making in connection with this work is that the author is himself an ex-pilot of the Air Service, and thus is able to maintain technical accuracy, which is none too common in flying stories.

But for the work of the Royal Flying Corps, as depicted by photographs, we would specially commend that volume, now a familiar sight on every bookstall, with its striking cover of cloudscape and a swooping aeroplane. Lord Hugh Cecil, himself in the Service, has written a most interesting introduction describing the actual work of the R.F.C. in which he mentions that the dangers of training have rather increased than diminished. The *Illustrated London News* is responsible for the printing of this admirable volume, the cost of which is half-a-crown, the proceeds going to A.F.C. hospitals.

The Fleet Annual, 1917 (Chapman and Hall, 4s. net), provides enlightenment for the lay mind in its list of the vessels of the British Navy, a list that is well worth perusal by all. There is, in addition, an excellent outline history of the war from the naval point of view, together with a naval roll of honour for the year which this "Annual" concerns, and a mass of other matter relating to such varied subjects as naval separation allowances and submarine warfare. It is a very useful and well-compiled volume, tabulating all that can be published, and containing many facts about the Navy. Mr. Lionel Vexley, compiler of the "Annual," has the advantage of thorough technical knowledge of his work, as is evident in his selection of matter and in its arrangement.

Messrs. HUTCHINSON & CO.

announce an important New Book giving

the Secret History of the Crisis told for the first time.

By an Independent Liberal.

Extracts from the First Reviews:

PALL MALL GAZETTE.—"The book is written clearly, honestly, and with obvious enthusiasm. It should be widely read."

REYNOLDS'S WEEKLY NEWSPAPER.—"A valuable and interesting book."

DAILY CHRONICLE.—"It is an engrossing narrative. It is a revealing narrative. Better still, it is a reconciling narrative."

THE OUTLOOK.—"The anonymous author of this personal history of the part taken in the war by Mr. Lloyd George has followed the events of the war with scrupulous care and acute observation."

GONG SOUPS AT THE FRONT.

GONG SOUPS are satisfying and sustaining—as rich as home-made soups and much easier to prepare. A few tablets are always welcomed in the parcel from home: they form a delicious warming meal.

On the distant fronts where vegetables are difficult to obtain, they are specially acceptable.

Extracts from two interesting letters received from France:—

"The GONG SOUPS you sent are excellent, especially in wintry weather, and I hope you will not by any mischance forget to put a few of them in each time."

"Many thanks for the parcel of GONG SOUPS; they are one of the most welcome things that can be sent out, and are appreciated by all. A few should be enclosed in every parcel: they are so handy, easily made, and a welcome addition to any rations."

Twelve Different Varieties:

Scotch Broth	Ox Tail
Mock Turtle	Thick Gravy
Pea	Celery Cream
Mulligatawny	Green Pea
Lentil	Hare
Kidney	Tomato

GONG SOUPS

Reversible Caps

Nothing so clever in the way of practical headgear may be found as some reversible caps. Besides their practicability, they are becoming into the bargain, two results that do not always combine. Women war-workers are finding these caps particularly well suited to their needs.

For one thing they are weather-proof, so that they can equally well be worn in wet or fine weather. With a cap like this and a raincoat, an umbrella is a superfluity in the worst of weather. Then they are reversible, so that it is practically two caps in one. One side is velvet, the other silk, and no matter which is worn outward the look of finish is the same. As a strict matter of fact, most women prefer the velvet outside and the silk as a lining, but this is a mere matter of taste and a question for personal decision.

In black velvet with the silk either in l l i c k or in some charming contrast of colour they make an instant appeal. Fitting closely to the head though they do, immovability in a wind is made a still more assured matter by a narrow band of ribbon which, passing round the crown, can tie the whole thing so to speak on the head. For motoring they are without equal.

The brim is a soft pliable affair and can be bent this way or that to best suit the wearer. Indeed, from beginning to end, these caps are what the Americans call "a proposition," are therefore particularly worthy of our regard.

A New Storm Coat

For sheer sensible design a new storm-coat stands on a pinnacle alone. It is made with a special wind shield, this being a piece of material in front of the coat going underneath in reverse way to the side it buttons. Hence an unusually protective garment, and an advance in comfort on the customary type of storm-coat. With this wind-screen no rain or wind can possibly penetrate.

Now that women are doing such arduous things and being out in all winds and weathers, a coat such as this is nothing more nor less than a boon, to be duly acclaimed and appreciated as such. It is made by a famous maker with years of reputation to his credit, and is in every way a coat that can be thoroughly recommended from A. to Z.—material, cut and every detail being up to the most exacting requirements.

An Alarm Travelling Clock

Numbers of folk nowadays mainly travel to keep important appointments, and to all such what could better appeal than a luminous travelling clock, adding an alarm to all its other virtues. These clocks are really capital affairs, waking one up as they do at any given moment, besides enabling the time to be seen perfectly easily in the darkest night.

For V.A.D. and other war workers a clock like this is an inestimable boon, and indeed for the private individual with humble but nevertheless important duties at home, its points are not to be despised. It is an eight-day clock, and its case is in many different colourings.

The same people also are selling all kinds of less ambitious travelling clocks—a luminous eight-day clock in different coloured Morocco cases being but £2 10s. The main difference, indeed, between the two is that the latter one does not boast an alarm and is cheaper in consequence.

An excellent little travelling clock also of less super-type—being non-luminous and without an alarm, costs but thirty shillings. This is a one-day clock, and while not pretending any particular distinction can nevertheless claim absolute reliability, for it is guaranteed, and of lever movement.

Madame Carlotta Destino's Spanish Toilet Preparations are far too valuable a matter for a light dismissal, being absolutely unique. For one thing, they are her own private recipes, having been used by Madame Carlotta and her friends for a long time.

One special point about them is that they are so delightfully cleansing as well as being fragrant and pure. La Camelia Skin Food cleanses the skin much more effectually than soap does, and as everyone knows, a clean skin is far towards becoming a good one. Used during the day it protects it from wind and weather, at night it soothes and feeds it—it being as important to feed the skin as the body. It costs 2s. 6d. and 4s. 9d. La Camelia powder is perfect to use, and so is the Day Cream, this giving the softened fresh look every woman should possess. The first costs 2s. 3d., and 3s. 9d., the last 2s. 6d. and 4s. 9d., and all can be found in that most fascinating spot Swan and Edgars' scent and powder department, which is at Piccadilly Circus.

OXO

AT THE FRONT.

Hot OXO is an inestimable boon to the fighting forces at this time of the year.

It takes up little space, is easily carried, and can be converted quickly into a hot nourishing drink which, with bread or biscuits, will sustain for hours.

From France:—

"We are a unit of the 'Old Contemptibles' and so are just embarking on our fourth winter in the field, and I assure you we are very thankful for a cup of hot OXO during the cold wet nights. The winter appears to have set in very early this year out here, and it is extremely wet already, and I am afraid the mud, etc., will be worse than last winter."

From Mesopotamia:—

A correspondent kindly writes us as follows:—

"You may be interested to know that I have been sending OXO to my son in Mesopotamia, and he writes: 'The OXO you sent made many meals worth eating. If you had seen the number of fellows who asked me for some, and whom I had to refuse, you would be inclined to write OXO a stirring testimonial.'"

FOOD RATIONS

LET it be clearly and distinctly understood that the introduction of food rations in this country is only a question of time. They may be introduced before Christmas; they may be postponed until Easter, but sooner or later a number of the necessities of life, more particularly those of which the weekly consumption has been specified by Sir Arthur Yapp, while the actual amount consumed is still left to the goodwill of the consumer, will have to be doled out weekly in order that there may be enough to go round. The problem with which we are more directly faced is one of distribution. This is the most difficult task of all to deal with; how difficult only those who have ever had to deal with famines are aware. In India, where periodical droughts cause serious food shortages over large areas, the problem was most carefully investigated some thirty years ago and a Famine Code was drafted which furnished precise instructions. Although there is nothing resembling famine in the United Kingdom, a shortage of several vital commodities is present—a shortage, that is to say, as compared with normal times, when plentiful supplies permitted a considerable margin of waste in the process of the foodstuffs passing from producer to consumer. This shortage might easily develop into famine in certain districts through lack of control and direction unless the Government took the work in hand in good time.

We are very sceptical whether voluntary rationing will ever achieve any substantial reduction in the consumption of foodstuffs. To begin with, the popular mind has been trained for years to regard Government as its keeper. The licensing laws rest on the assumption that the people are incapable of deciding for themselves how much alcohol they may safely drink. Thus Government declares the people to be incompetent to regulate their appetites in so far as luxuries are concerned—luxuries, the consumption of which is naturally restricted by the means at their disposal—wherefore for it now to turn round and expect them, by reason of a speech of a Government official or of a paragraph they may have chanced to read in their newspapers or on a hoarding, to restrict their consumption of necessities, which they have ample means to obtain, seems, to put it mildly, illogical. But it may be argued circumstances are so different. This is only true in a sense. Most of the food staples are still as easy or almost as easy to obtain as alcoholic liquor was before the war; and as we have before pointed out, it requires a strong effort of the imagination for any human being to realise that by reducing his portion of bread at a meal by a slice or two or his Sunday joint of beef by a lb. or a couple of lbs., he is doing his duty by his country. No doubt many households can be found, especially among the better educated of the working classes and also among the upper and middle

classes, where a strict regimen is in force and has been in force ever since the war began, but even placing these at the highest possible total they are relatively few.

The fact has also not to be overlooked that there is a considerable alien population in this country. It is known that the bulk of the men are employing every subterfuge they can think of (some of which are exceedingly clever to avoid military service. Is it reasonable to suppose this type of humanity will do anything to restrict its consumption, especially at the present time when more often than not it is enjoying the hectic flush of war-time prosperity? It has been said in responsible journals, and it has never been contradicted, that the alien peoples in our midst, whether in London or Leeds or elsewhere, are consuming more food per head than ever before. Nor need we be surprised at it considering their former misery before they found an asylum in this country, and knowing as we have learnt to know to our cost how liberty is abused by those new to it, Russia of course being the outstanding example, the very country from which the bulk of these people come.

There are various causes for the present food shortage, but looming behind them is the ominous truth, that the world production of food shows a substantial diminution, simply and solely on account of the war, and of the vast acreages that have remained untilled during the last two or three years, or have only been partially tilled for this reason. So the whole question of the national food supply and distribution is fast becoming a problem which will need the most scientific methods to solve satisfactorily before it can be safely left to the natural forces that controlled it before the war. We are already suffering from the inevitable mistakes of inexperience in public distribution; no better instance could be cited than the present tea shortage. Tea is a British Empire product; it can be shipped and is shipped practically every month in the year, and the amount of tonnage required to keep the British teapot full is comparatively small; but directly the ordinary channels of trade were interfered with, new troubles arose, and it is only within the last few weeks that arrangements have been completed to overcome the present shortage. The same is true of margarine, though the difficulties were of a different character, and it may be taken for granted that directly the control of any staple of life passes from private to public hands, there are bound to arise obstacles which will require time to remove.

To postpone food rations to the last possible moment would be most dangerous. They should be instituted before there is any actual need for them so that when the pinch comes, if it does come, the new channels of distribution will be running smoothly and easily. This is only to put into public effect the daily practice of every citizen of common sense. In such households, economy has been carefully studied; experiments have been made, according to means, of every form of substitute, and the pride is not to live up to any scale of voluntary rations, but to live below it. Last year potatoes were a luxury; everyone was begged to use them as sparingly as possible; this year they are just the reverse, and the more potatoes that are eaten and the less bread, the better. This is very confusing to the humble housewife who budgets in ha'pence, more especially as almost every week brings with it some new puzzle. The sugar cards at the moment are a perpetual perplexity, and it is difficult to find any one who understands the right procedure. The system of strictly rationing hotels and restaurants as regards meat, bread, sugar, etc., has worked excellently, but because they offer to their wealthy and cosmopolitan clientele a choice of unrationed foods, they run the risk of being unfairly held up to obloquy. It is high time that the whole question of food rations was dealt with in a much more straightforward manner, that fewer speeches were uttered, less gratuitous advice offered, and public action taken which would place the nation in a secure position whatever the future may hold. In saying this we do not overlook the work it will entail or the inconvenience it will cause to individuals, but we maintain that both work and inconvenience will be less if compulsory rationing is not postponed to the last moment, and then rushed. That is the danger that has to be faced. And it is a very real danger.

Cambrai and Bourlon Hill

By Hilaire Belloc

ON Tuesday of last week, the 20th, at dawn, in a mist which covered the ground occupied by the 3rd Army under General Byng, was launched one of the most important offensives of the war: highly important—not only in its immediate results, but in its novel tactical character and the promise this affords for the future.

The essential features of the attack were (1) The use of a very large number of tanks in line; (2) their advance without any previous bombardment over firm, open and unspoilt country; (3) the success of the surprise thus effected and the consequent destruction of the very strong successive positions known as the "Hindenburg line" upon the sector where these cover the essential nodal point of Cambrai.

Before discussing the bearings of this success upon the war as a whole, we will follow its progress with the aid of Sketch Map I., so far as the accounts given in the despatches and by newspaper correspondents permit us to do so.

Taking for our centre the British positions in Havrincourt Wood, you have a line of departure running north-north-west and south-south-east of which the right hand limb is about four miles in length and the left-hand limb about six, but the main effort upon this left-hand limb hardly extended for four miles. In other words, you have an advance starting from a base the whole length of which is some ten miles, but the main operative part of which is less than eight. There was, of course, subsidiary pressure exercised far beyond these limits, both to the left and to the right as far as Epehy on the one hand, and as far as in front of Bullecourt on the other. But the main effort was upon the sector mentioned, of which Havrincourt Wood is the centre, and of which the length may be set down at under eight miles. This eight miles of line forms the sector which exactly covers Cambrai. A perpendicular dropped from the centre of Cambrai Town bisects this line exactly, falling upon the British positions in Havrincourt Wood; and the distance from those original positions to the centre of Cambrai is about seven miles or a trifle more.

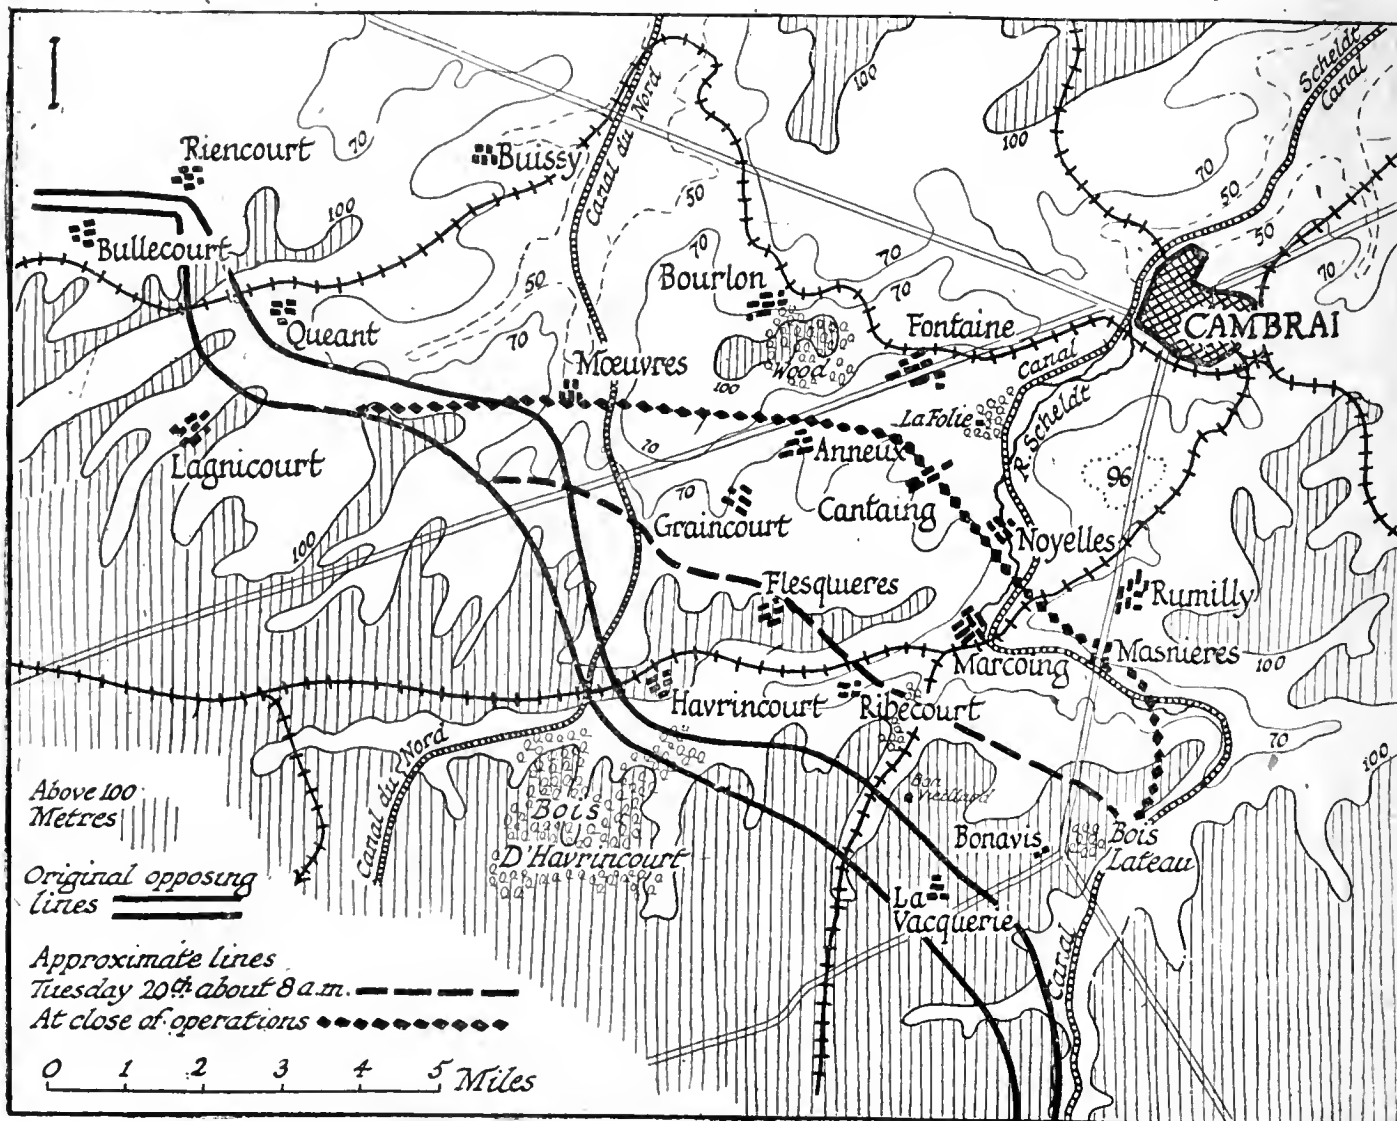

We must retain (even in this first part of our description where we are only following the movements over the ground), the essential fact that *Cambrai is the knot of a complete road system and also of the main railway system of the enemy in this region.* Therefore, his loss of such a centre—or, what

is the same thing, his loss of the power to pass his supply through it—would at the least entail the modification of his whole line for a very great distance north and south of it.

The order of battle along this line, so far as can be reconstructed from the despatches to hand at the moment of writing, would seem to have been this: Upon the right troops from the Eastern Counties; next to these English Rifle Regiments and other English units; next to these again Highland regiments; in the centre Territorials from the West Riding of Yorkshire, and to the left of these again troops from Ulster. The list is, of course, quite incomplete, but is all that can be drawn up from the information so far afforded.

In the first advance, during the early morning of Tuesday the 20th, the tanks, having broken down the very wide belts of wire protecting the first trenches of the enemy's system, and the infantry following through these gaps, the points attained were, upon the right, the Hamlet of Bonavis and the wood of Lateau, on the height which overlooks the Scheldt Canal, and at the meeting point of the great national roads which run to Paris and Chalons respectively, and after their junction continue in one road for Lille. This dominating point was captured by troops from the Eastern Counties. From it the ground falls away for miles to the east and north towards Scheldt and Cambrai.

Immediately to the left of this position, another dominating point, that of the spur in front of Vacquerie upon the farm known as that of the Bon Vieillard, was occupied by English Rifle Regiments and Light Infantry. To the left again English County troops advanced along the ravine which carries the railway and occupied the wood of Couillet and going down into the depression still further to the left carried Ribecourt in its hollow. To the left of these again the Highlanders crossed the same ravine (about 120 feet lower than the heights from which the advance started) and entered Flesquières, a point at which the despatches tell us there was very heavy fighting. Next, in the Central point, the West Riding Territorials coming down the slopes, which face the cut part of Havrincourt Wood to the canal, crossed the same ravine and carried Havrincourt itself on its height, the village being in their hands between 8 and 9 in the morning. Here also there was an attempted rally by the enemy which failed, and

the British were on to the railway and beyond at the hour mentioned. Lastly, the Ulster troops advanced down the spurs which fall to the left bank of the Canal du Nord, and went on up along that vast cutting northwards towards Moeuvres.

At about this hour of eight or nine o'clock, therefore, the advance would seem to have reached some such line as that indicated on Map I. by the first dotted line. Whether there was any definite separation between the first and second phase of the advance on this day, the despatches do not tell us, but the next message carries the advance forward very considerably.

Under breaking weather and the beginning of what was to be a continuous heavy rain, the important crossings of the Scheldt Canal at Masnières (no less than 5,000 yards beyond the wood of Lateau) were secured; to the left of these the country town of Marcoing (which had also been a railway junction of some importance to the enemy) was occupied, while the West Riding troops, which had already passed through Havrinourt, went right forward to Graincourt and even reached and occupied Anneux—a further advance of 5,000 yards, and a total advance since dawn of more than 4½ miles. Meanwhile, the Ulster troops upon the left of the canal had cleared all the country up to the Bapaume and Cambrai road and were crossing it.

At the close of Tuesday's operations, therefore, it would seem that the British line ran somewhat as does the second dotted line upon Map I. A great wedge has been thrust into the enemy's positions; the very strong defensive system known as the Hindenburg line has been broken through upon some seven miles of its course and the last elements, its third line, reached in several places.

This first day, Tuesday, was the day of complete surprise, in which the enemy had not time to organise his resistance; but there began, of course, from the first news of the British success, the most intense efforts at counter-concentration by the enemy. Troops were being hurried forward all that Tuesday noon and afternoon by all the roads and railways which converge on Cambrai; he began to dig especially just south of Bourlon Hill, the crux as we shall see of the new positions, and the effect of this concentration was first to be felt the next day and with increasing force on the days following. Meanwhile, very heavy rain was falling on that Tuesday evening and continued all night, a circumstance adverse to the offensive and especially to the work of the cavalry, which had already begun; for mounted troops, in numbers which were considerable, but on which we have no precise information, rapidly followed up the advance and were at work in the country cleared by the day's success.

Early in the morning of Wednesday the 21st, the fringes of the wedge thus driven in were slightly extended. Two lines of trenches and a portion of the third system of the Hindenburg line were carried somewhere upon, or close to, the canal in front of Crevecoeur. More important, the village of Noyelles, more than 2,000 yards in front of Marcoing, and only a couple of miles from the suburbs of Cambrai was seized; the Scotch took its neighbour Containg and advanced somewhat down the spur beyond: reaching La Folie Wood. The troops of the West Riding reached the Bapaume Road beyond Anneux just south of Bourlon Wood, while on the extreme left the Ulster troops crossed the road and entered Moeuvres. By evening even the point of Fontaine, on the other end of Bourlon Hill, was reached, and that village occupied, but the line so drawn was the extreme limit of the first effort and could not be entirely maintained.

One of these counter-attacks had already developed in great strength with the troops of the 107th enemy division brought back some little time ago from Russia. This was on the right in front of Masnières, and constitutes the operation in which the enemy speaks of the British failing to advance on Rumilly, though there is no definite information from either side that this village was either occupied or lost. Other very strong counter-attacks were launched against Bullecourt far away to the left, to create a counter-pressure there and to attempt the recovery of a certain amount of ground which had been lost to the Irish regiments in that region. While upon the following morning, Thursday the 22nd, Fontaine was re-taken by the enemy; he got back La Folie Wood, and he appeared also in great strength before Moeuvres and reoccupied that village into which the Ulster troops had penetrated. His action here was obviously based upon the importance of maintaining the Bourlon Wood.

This day, Thursday the 22nd, began to mark a clinch in the operations of both sides, the preparation of further work to come. The British were consolidating the line they had reached and following up the advance with material and, where necessary, repairs; the Germans were continuing to pour men down upon the threatened region.

On Friday, the 23rd, therefore, the news was meagre from both sides. The British evening despatch of that day contains

no more than these words: "Operations were continued by us to-day against the enemy's positions west of Cambrai; latest reports show that they are developing satisfactorily." While from the enemy's side came a message, apparently sent earlier in the day, even more brief and very vague, to the effect that "the renewed English attempt to break through south-west of Cambrai has been shattered with most severe losses for the enemy."

Saturday, the 24th, was taken up the whole day long with the effort to occupy Bourlon Hill and Wood and the corresponding enemy defences, a fluctuating action to which more attention must be paid in a moment. On Sunday Bourlon Hill was thoroughly occupied, its height secured and the northern reverse side held also after two days of fluctuating and very heavy fighting. Bourlon village, at its foot beyond, was only held for a time, and by Sunday was in the enemy's hands—but the hill above it, the essential position, was clearly maintained.

Such are the details of the successful advance begun on the 20th of this month, the Tuesday of last week. Now let us examine the meaning of the operations.

The first thing we note is that, as has been already remarked, the attack was made directly in front of Cambrai itself. What was the reason of this?

To understand the strategic importance of the Cambrai sector, we must first of all see where Cambrai stands in the old line (now broken) and next appreciate how all the means of communication centre on Cambrai.

Cambrai, in its relation to the old line, is exactly the half-way house between the sea and the point where it turns a sharp corner in front of Laon to run thence eastward past Rheims to Lorraine. Cambrai, therefore, merely as a geographical point, is the centre of the northern limb of the German defensive angle; and a grave weakening of that point would destroy the whole northern limb more effectually than at any other point. But if the northern limb goes the eastern limb goes too. The situation may be very simply followed on the elementary Sketch II.

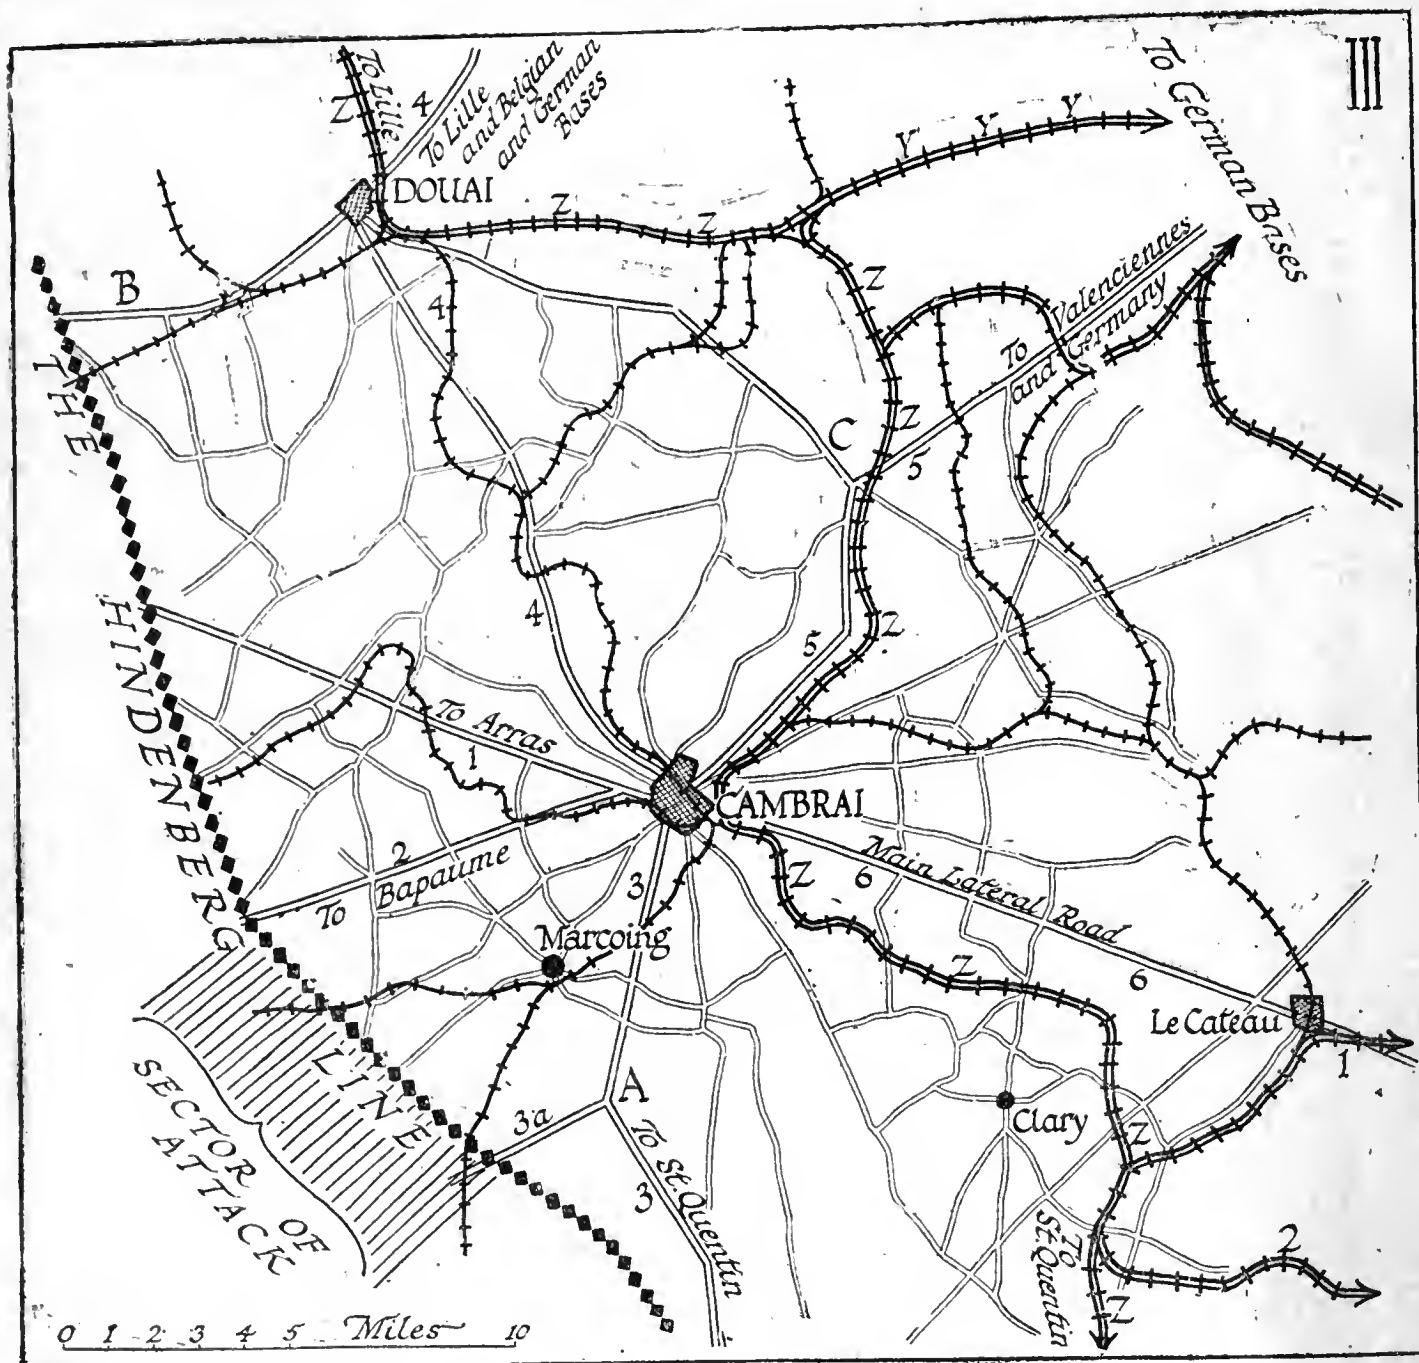

There are two great limbs, the meeting place or corner of which is at X, where the French had their big success with 11,000 prisoners and 200 guns the other day in front of Laon. A successful stroke at Cambrai takes the northern limb exactly in the middle, and if it succeeds divides that northern limb, shattering it more effectually than it could be shattered at any other point.

Already the big bulge produced in front of Ypres up to Passchendaele had drawn heavily upon the enemy's resources; a blow of a different kind, far more rapid, quite unexpected and much less expensive, against Cambrai, completed the design, the final results of which we have yet to watch.

But Cambrai was much more than the mere middle of the northern limb. It was also, and has been since the beginning of history, the nodal point upon which met every kind of communication, not only for its own region, but for northern France as a whole. Map III. will make this clear. Though I leave out in this sketch the waterways which have an importance of their own even to-day (and it was these which in primitive times gave Cambrai its importance) the roads and railways alone suffice to show what a knot of supply the place is.

The great Roman roads (many of which still survive in modern form) radiate from it like the spokes of a wheel, so do all the modern roads. Of these, six great main roads concentrate upon the town; three of them, those to the west, supply the front of what was until the other day, the unbroken Hindenburg line covering the city, to wit (1) that part of the Arras road still remaining in German hands; (2) the

corresponding fragment of the Bapaume Road; and (3) all the St. Quentin road, the particular value of which last was its feeding the front line all the way to St. Quentin, while from the latter at the point marked A on Map III., a branch, the few miles in German hands of the main road from Paris to Cambrai (3) further served that front.

Upon the eastern side the three remaining great roads led, two of them to the enemy's bases in Belgium and Germany, the one (4) through Lille to the other (5) through Valenciennes. The former by a branch road from Douai, marked B on Map III., further helped to feed the front; the latter enjoyed a cross communication road from Douai, marked C, which added to its usefulness. The third road (6), passing through Le Cateau, was the main lateral road for traffic south-east, a sort of artery for all the rest of the front.

In between these six great spokes of which Cambrai is the hub, there was a large system of country cross roads, all of which ultimately came from Cambrai and which have their own subsidiary centres on which they concentrate, such as Clary and Marcoing.

Cambrai was, therefore, so far as roads alone were concerned, the centre of a vital web.

It was also a very important railway centre. The great main, international line from Paris to Germany runs up through Cambrai from St. Quentin. It is served by a main line also coming in from the south and east—that is, the rest of the German front—and it splits after Cambrai into two, one part going through Douai to Lille and so to central Belgium and Germany, the other to Valenciennes and so to southern Belgium and Germany. I have marked the main trunk line, with the figures 2, 2, on the Sketch III., and it will be seen there how the other double lines and the supplementary angle lines feed it and dents from it. Everything going and coming through Lille or through Valenciennes and so to Belgium and Germany had to pass through Cambrai.

All movement up from the east came by the two feeding lines (1) and (2) on Map III., and the maintenance of the front from Cambrai to St. Quentin and again from St. Quentin to Rheims had Cambrai for a necessary place of passage. The single line railways indicated also upon Map III. supplemented this system and, as will there be seen, also centred upon Cambrai.

From these considerations the value of an attack *right upon the sector covering Cambrai* will be evident, and the reason that the sector of the attack thus chosen immediately faced the city will be equally clear.

The sector of Cambrai having been chosen and the attack having been launched exactly opposite that town and directly for it, the German front was driven in over an area nearly rectangular in shape and from four to five miles deep. The consequence was that two flanks were created, one to the south and one to the north, *behind* the old Hindenburg line. The operations were then being conducted in the open with the enemy reduced to entrenching himself perfunctorily and very rapidly and depending rather upon his pouring in of men than upon artificial defence. The British had got, on last Tuesday, right in behind the line of that defence, which he had called impregnable, and which the less responsible of our own orators and writers had described in much the same terms and at the enemy's valuation.

Here we must pause to note in the British Command that General Byng at the head of the 3rd Army, had done what is one of the chief tests of success in a prolonged war, that is, invented and put into practice a new tactical method. The tanks were here used in a fashion favourable to their method of fighting over open country, unspoilt by heavy shelling and not blinded by hedges or numerous woods. It was these engines which broke the great gaps in the tremendous belts of wire, and which destroyed in the first few hours of the day all the defensive system of the enemy.

Their action would, however, have been impossible but

for the element of surprise which was so successfully introduced. Accounts differ as to whether the preliminary bombardment was entirely suppressed, or whether a certain measure of gun fire was used to drown the noise of the approaching machines. But at any rate the enemy was thoroughly taken by surprise and to that we owe the great success which followed.

Now let us turn to the way in which the fruits of that success might be reaped.

We have seen that this driving of a great wedge through the shattered defensive system of the enemy created two flanks, one facing north and one facing south. *It was the first of these which was the vital one*—(the flank running from near Fontaine to Mœuvres)—because it turned the Queant-Drocourt switch line which covers Douai and the railway communications with Lille and Belgium, and because it had corresponding to it fifty miles away the big bulge created towards Roulers by the recent occupation of the Passchendaele Ridge. If this northern flank could be pushed further, not only Cambrai would go, but all the defensive system between Cambrai and Lille. It was on to this northern flank, therefore, that the energy of the new advance turned, converted by nearly a right angle from its original direction.

Now in this northern flank, which runs from the neighbourhood of Inchy to the suburbs of Cambrai (a distance of about seven miles) there is present a natural feature of which the enemy took immediate advantage in his defence, and which has been the centre of a great battle all during the Friday, Saturday, and Sunday of last week. This natural feature is an elongated hill known as the Bourlon Hill, crowned with its wood, known as Bourlon Wood—both named from the little village of Bourlon upon the northern slope. Complete possession of this hill will be the test of success.

Bourlon Wood

Bourlon Hill with its wood, is the obstacle or bastion which interrupts the effort to roll up northwards and use the flank created by the British on the previous days. The British having got behind the Queant line into country where no artificial defensive was yet prepared, and where their advance could only be checked by pouring in masses of men, nature had provided the enemy here with the dominating mass of Bourlon Hill, rendered more formidable by the fact that its height was covered with wood. At this point we shall do well to examine this obstacle in greater detail, and for that purpose I append the annexed Map IV.

The general level from which we may take heights of any prominence to rise in this region is the contour of 70 metres above the sea. The watercourses are slightly below that contour (for instance the brook near Mœuvres is 62 metres only) and the open rolling fields swell up to somewhat over the 80 metre contour. Cambrai in its hollow is, at the Scheldt, less than 50 metres above the sea. But all round the immediate neighbourhood of Bourlon Hill 70 metres is our base line, so to speak, from which we can best measure prominent heights.

Now, taking this 70 metre contour as our base line, Bourlon

Hill is a sort of pear-shaped lump the axis of which runs from just a little south of west to just a little north of east. It is rather less than 8,000 yards or five miles in length, and its flanks are marked by four villages, Bourlon, Mœuvres, Anneux and Fontaine. Bourlon itself, giving its name to the whole system, is on the north and built right on the flanks of the hill. Mœuvres is on the west beyond a little brook, which marks the lowest point of the system upon this side. Anneux is on the south beyond the Bapaume-Cambrai road; while on the south-east is Fontaine Notre Dame, which lies astraddle of that road between the 60 and the 70 metre contours.

The height rises regularly up to a summit rather over a mile long, but only a quarter of a mile across, the height defining which is on the 100-metre contour; and on this summit there are two slightly higher portions, an eastern and a western, with a very shallow saddle between them. It will be seen from this that the hill rises roughly 100 feet or somewhat over 30 metres from the general levels around.

Not exactly corresponding with its summit, but overlapping the greater part of it, and coming down upon the northern, southern and eastern sides is Bourlon Wood, roughly rectangular in shape and rather less than a square mile in area—say, some 600 acres. There are several rides through the wood by which vehicles can move and along which, probably, tanks could operate; the most important of them for the purpose of advancing upon and holding the height is the Y-shaped system, the two southern branches of which meet on the saddle, and the stem of which is extended northward to the neighbourhood of Bourlon village, marked upon Map II.

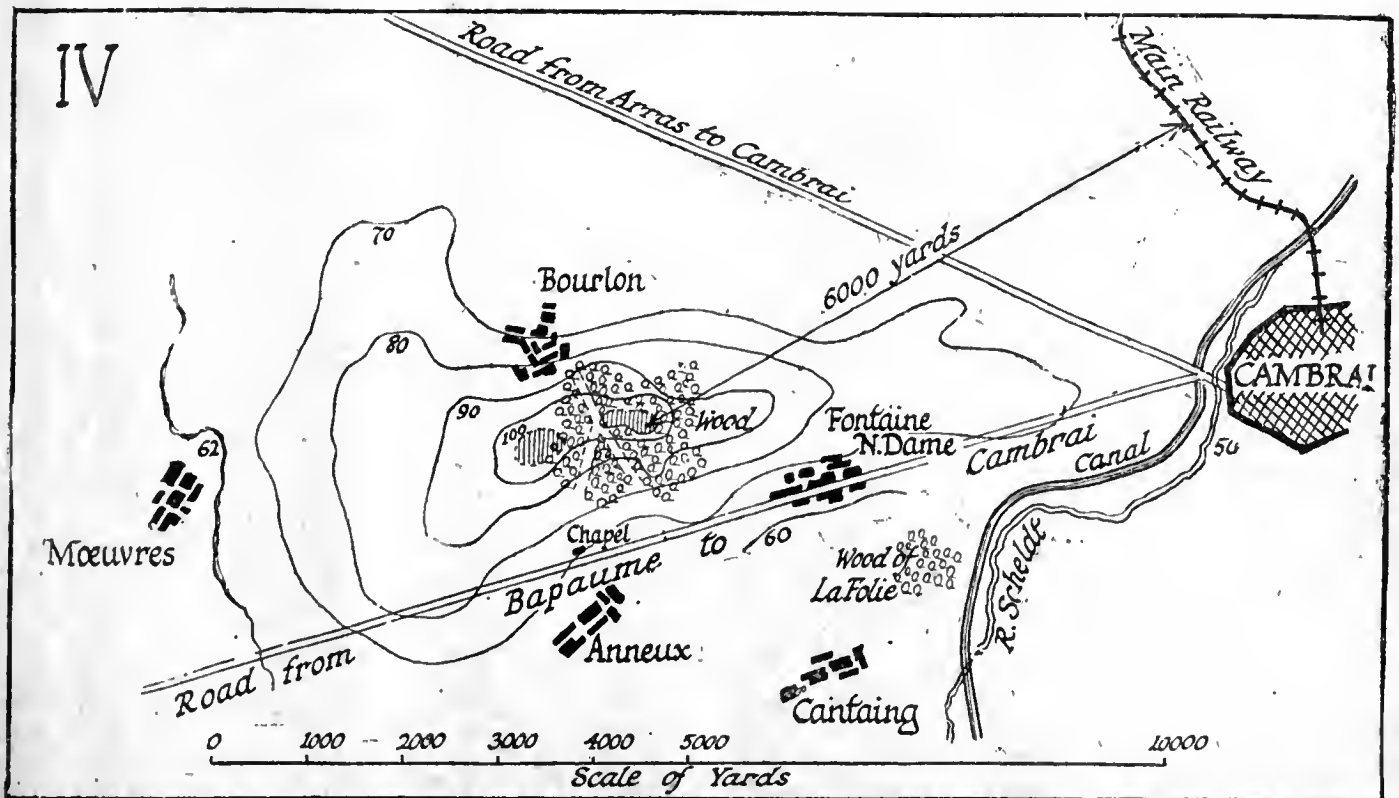

With these features of the ground present to our imagination, we may appreciate the task which lay before either party in the struggle for this height. I should mention here, by the way, that my contours on Map II. are only rough and approximate, and that I am speaking of the wood as it existed in peace time; for there has been no public information as to what the enemy may have done in the way of cutting.

The hill was of value to the enemy for concealing his artillery behind it, and the wood upon its summit is a formidable obstacle, such as have been all the woods in this war upon the West. The enemy had here peculiar advantages for resistance also in the simplicity of the hill; in the fact that its length was spread out in front of his opponent and in the complete domination it gave him over all the surrounding country for observation, as did its reverse side for concealment. It presented corresponding difficulties of access and capture to the offensive.

Domination of the Railway

On the other hand, once it was held the chief strength of all that enemy position was lost. Those upon its summit were directly east of Cambrai and dominated the hollow in which Cambrai lay by a height of some 200 feet and at a distance of less than 7,000 yards. They could see and dominate at a range of only 6,000 yards the great main railway to Lille and Valenciennes.

At the beginning of the operations the British, at the

conclusion of their first rapid advance, found themselves at the foot of the hill occupying Anneux, touching Moeuvres, and just outside Fontaine.

On Thursday last, before evening, as we have seen, Fontaine was for a few hours in British hands. Upon Friday a strong counter-attack of the enemy re-entered it.

Upon Saturday a very fierce action began for the capture of the hill. We had in the despatches relating to that day no definite accounts from either side. Both were in general terms. The British to the effect that heights "about" Bourlon Wood had been mastered in the course of the day, partially lost again and then regained. The Germans to the effect that the British had penetrated into the wood and apparently even to Bourlon village, ending with a sentence to the effect that the wood had been recovered and the village also. So far the description was difficult to interpret. The British had never claimed full possession of the wood, still

less of the village beyond, and so far as one can judge what really happened was a thrust into perhaps half of the wood and the permanent holding of the highest land just to the west of it, with perhaps an occasional thrust reaching the outskirts of Bourlon village. Meanwhile, upon the right and upon the left Moeuvres and Fontaine were in enemy hands, but suffering strong and repeated assault from the British.

That would seem to be the general though confused aspect of Saturday's struggle.

By Sunday the whole summit and nearly all the wood was clearly mastered. Bourlon village lower down, sloping to the hollow on the north was still in German hands, but the great obstacle and observation point was in British hands, and if it securely so remain the value of Cambrai is lost to the enemy. His great main railway is seen and rendered unusable at a range of only just over three miles, all the countryside is overlooked.

Operations in Judea and Samaria

The first part of the week's news with regard to the Palestine front principally concerns the threat to the only road now supplying Jerusalem.

The left of the British line still stood last week covering Joppa, but faced by the new Turkish positions just before that town and running along the slight height which forms the watershed of the Auja River. But the centre was in movement, and the movement was clearly designed to threaten the only avenue whereby a retreat of the Turkish troops from Jerusalem and the positions south of Jerusalem as far as Hebron can be effected and their munitionment and re-victualing assured so long as they remain in their present positions. There is, indeed, a possibility that these troops, were they cut off from the north, could retire eastward across the Jordan and reach the railway line which runs along the plateau of Moab. It depends upon their numbers, and upon whether the very imperfect tracks for such an operation have been improved during the war; for the only known good road, or rather passable road, by which their supply can still be maintained and their retreat assured is the road from Nablus-Shechem to Jerusalem, and it is upon their maintenance or loss of this road presumably that the next phase of the campaign will turn.

We shall understand the position better if we begin with a rough sketch of the ground. Judea and Samaria form the backbone of the mountainous system about fifty miles long from Hebron in the south to Nablus in the north, between two and three thousand feet, in general level, with the whole country to the south round Hebron above the 3,000 foot contour, and the peaks to the North also above it. This backbone is not a ridge, but rather a plateau, the eastern wall of which is a very sharp descent into the deep trench of the Jordan and the Dead Sea—a trench varying in depth from six to 1,300 feet below the general level of the Mediterranean; therefore from 4,000 to over 5,000 feet below the general levels of Judea and Samaria. Beyond this trench is another mountain wall which supports the plateaux of Gilead and Moab to the east.

On the West the mountain system of Judea and Samaria falls fairly sharply (more sharply in the south than in the north) to the foothills of the Sephalah and beyond these again there is the sea plain. The mountain system which was the home of the Jews in antiquity, and is the scene of the Old and the New Testaments, may be given an average breadth of 14 or 15 miles. It is, of course, far too complicated to be susceptible of any exact measurements, but that is the sort of width which it bears throughout its length. The foothills to the West are a belt of anything from eight to ten miles and the sea plain a belt varying from 10 to 20 at the very widest.

Jerusalem, the only large town in the whole district, stands rather to the eastward side of this plateau, at a point only 33 miles from the sea as the crow flies, which 33 miles are taken up as to about 10 or 11 of them by the remaining width of the mountain plateau; about eight by the foothills and the remainder by the sea plain.

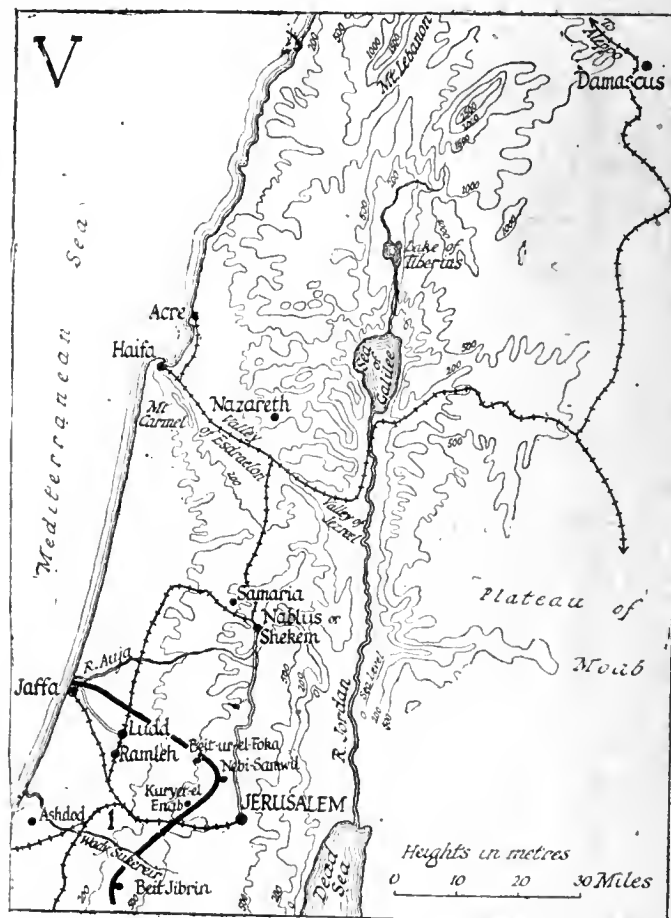

From the watershed of the central mountain system, which forms Judea and Samaria, run rough and often deep and narrow torrent beds, nearly all of them dry in summer, most of them now running with water, which join to form short rivers of the sea plain. These gulleys are more savage and difficult for travel in the south or Judean part of the range than in the Samarian or northern part. The latter is much more open country than the former, full of cultivation, with contours more rounded and with more soil. The passage up from the sea plain to Judea and Samaria then, and especially into Judea, has always been by some one of the easiest of these gulleys.

At the northern end of the whole system there is a trench which cuts off the hills of Galilee and the region of the Lake

of Tiberias from the mountain mass of Samaria and Judea to the south. This trench is formed of the valleys of Esdraelon and Jezreel and provides a continuous way from the sea to the Jordan valley.

This is by far the most distinctive crossing of the system, from east to west, and it has often been the road of great armies in the past.

But there is another crossing which has also been of historical importance during all recorded history. It runs through the heart of Samaria, and has put that district far more into contact with the general civilisation of the world than were the Judean hills to the south. This crossing may be called the Pass of Shechem or Nablus, and it is associated in the history of the Bible, as in that of mediæval and modern times, with the neighbouring height and former capital of Samaria, "the Watch Tower," for Samaria was built upon an isolated hill in the valley leading down from Shechem to the sea and, therefore, commanded the passage.

The importance of this pass of Nablus and Samaria in the present war is that it carries the main railway from the north and from Damascus with its stores and depots southward into Palestine. The railway cannot use the rugged mountain land. It comes down across the Jordan to the gap between Mount Ebal and Mount Gerazim, which stand like two sentinels above Shechem in the valley; it runs down the valley past Samaria and then follows along the easier country below the foothills to Lydda and Ramleh, shortly after which point it throws out the branch to Joppa on the one side and Jerusalem on the other, which is, under modern conditions, the chief avenue of supply for the latter town. Now the use

of this Jerusalem railway, as we have seen, was lost to the enemy when the British a fortnight ago seized its junction and later the points of Lydda and Ramleh as well. Not only was the railway lost, but the main road from the west to Jerusalem was lost as well. This road, which runs from Joppa through Lydda up to the capital, north of the railway, was cut when Lydda and Joppa were occupied. There is only one avenue of supply left, and that is the carriage road open to petrol traffic and probably improved during the war, which unites Shechem or Nablus on the main Damascus railway in the north with Jerusalem by a tortuous course along the ridge of the mountain land. It is only just over thirty miles in length, and so long as it remains uncut Jerusalem can still be supplied and a way out of it still remains.

On Sunday the 18th, the British occupied Beit-ur-el-Tahta, that is, "The Lower Beit," which is just on the edge of the mountain land overlooked by the Upper Beit, Beit-ur-el-Foka, both places are the Biblical Beth Horon, the upper and the lower respectively. Beth Horon, the lower, which the British thus held on Sunday the 18th, is in a direct line only seven miles from the vital rough road we have mentioned, but by the only path available for guns (if it is available for wheeled traffic at all) the distance is over ten miles; the total distance from Beth Horon the lower to Jerusalem itself is twelve.

To the west of Jerusalem, not threatening this main road, the British next day reached a point only six miles from the city, Kuryet-el-Enah (which was perhaps Kirgath) and there they are right in the mountain land of Judea. But it is the threat to the main road which concerns us, and the nearest peril to this was the presence in the hills north and east of Beth Horon of British cavalry only four miles west of Beeroth, a point on the main road, which, if it were cut, would isolate Jerusalem.

Upon Wednesday, the 21st, three days later, the British advanced another stage against the Jerusalem-Shechem road to cut which is their object on this operation. They stormed the site of Mizpah on the Nebi Samwil ridge—from the tower on which one can see the whole of the tableland from Samaria to Jerusalem—and stood, at the end of the action, less than three miles west of the road. Upon this success there followed very violent counter-attacks, obviously with the object of saving the road, possibly because the evacuation of Turkish troops from the south was already proceeding. Meanwhile, mounted troops were in possession of Beit-ur-el-Foka, the upper Beth Horon on the upper edge of mountain land. They had even gone further, but had been somewhat pressed back by counter-attack, and it is perhaps in this encounter that the enemy claims a certain number of machine guns and a few prisoners.

What now remains to be seen is whether the road—from which at Mizpah or Nebi Samwil the British are as near as they are to the main Cambrai railway line—a range of 5,000 to 6,000 yards can still be used, or whether it will be cut before the Turks to the south get away.

THE ITALIAN FRONT

On the Italian front there has been no appreciable change during the week. Continued attacks are reported upon the eastern end of the mountain wall just at the point where the mountain sector joins on to the river sector, the corner of the whole bent line, distinguished by Mount Tomba and Mount Grappa. But there is no news as yet of the massing of heavy artillery, and it may be presumed that the enemy is still completing his preparations for the main bombardment.

The details given are meagre and we cannot judge the situation properly upon them. All we know is that our Allies now stand on the extreme edge of the mountain wall above the plain, and that, so far as news reaching this country is concerned, the enemy do not yet seem to have opened with the great mass of heavy pieces they can dispose of. We are told that on the Piave itself no guns beyond five inches have been used, and of the mountain sector we have only vague accounts—no details of the weight of metal yet used.

H. BELLOC

The *Giornale d'Italia*, one of Italy's most prominent daily newspapers, has penned this fine tribute to British reinforcements:

Those English divisions sent here as a bulwark against the invasions of the Huns are among the most celebrated and valorous of the British Army. Those divisions know the homicidal mud of the Yser; they have learnt how to fight the Germans in a struggle without quarter, slowly, obstinately, implacably; they know what it is necessary to do to snatch from him step by step and inch by inch the ground to which he obstinately clings. The homage rendered by England to Italy in sending Italy some of her best troops must never be forgotten. The men of Vimy, Messines, and Passchendaele descend from the North Sea to the Adriatic to show the enemy that our alliance is not a theoretical or ideal convention, but that it signifies solidarity and identity of work and programme.

Le Dernier Croisé

BY EMILE CAMMAERTS.

TOMMY veille au pied du Calvaire,
La brise souffle de Syrie,
—Depuis combien de temps ont-ils scellé la pierre?—
Tommy veille, Tommy prie,
Dans la nuit brune, sur la terre brune, Tommy
Brun khaki.

Avez-vous vu briller sa bayonette,
Au clair de lune?
La croix aiguë de sa bayonette,
Claire au clair de lune?
—Depuis combien de temps L'ont-ils enterné là?—
Tommy courbe la tête,
Son âme veille, son corps est las.

Qu'attend-il, brun dans la nuit brune,
Sous la brise syrienne?
Qu'attend-il, au pied de la croix,
Sous le croissant de la lune?
Est-ce que ses frères reviennent,
Richard, Robert, Louis et Godefroid?
—Depuis combien de temps L'ont-ils enfermé là?—

Le sépulcre est tout proche où ils L'ont enterré,
Et le jardin de Joseph d'Arimathe.
Sous la lune en croissant, Christ est ressuscité
Et sa croix brille
Entre les mains calleuses du dernier Croisé,
Entre les mains calleuses et brunes
D'un ouvrier.

—Est-ce le voile de Madeleine qui flotte dans la brise?—

Tommy écoute une cloche qui tinte,
Tinte, tinte dans son village.
C'est Pâques ici et Pâques là-bas.
La lune soudain s'est éteinte
Derrière un nuage.
—Depuis combien de temps L'ont-ils enfermé là?
Dites, Richard, Robert, Louis et Godefroid?—
La nuit se passe et l'aube pointe,
Les merles sifflent dans les haies d'Elstree.
Tommy veille, Tommy rêve, Tommy prie.
La brise souffle de Syrie.

—Depuis combien de temps ont-ils scellé la pierre?—
Dites-le nous, Tommy, au pied du Calvaire. . . .
Mais Tommy ne répond pas, Tommy prie,
Dans la nuit rose, sur la terre mauve, Tommy
Brun khaki.

Caricatures—By Order

GERMANY must be badly in want of a Raemaekers for the Great German General Staff realises the deadly nature of his work. The Allied cartoonists have abundant material at their command, since the record of German atrocities on land and sea is proved to the hilt, and grows more horrible as fresh facts come to light. But the absence of facts is not to be permitted to interfere with the work of the German cartoonist. The following document, which reached the *Berner Bund* was communicated to the German Press by the Wolff News Bureau in Berlin in the form of an official circular issued from Supreme Military Headquarters. It runs:

The Imperial and Royal Propaganda Department, Section of Foreign Affairs, calls the editor's attention to the practice of the enemy press in caricaturing the Kaiser, the Crown Prince, Hindenburg, and alleged German militarism, with the evident intention of an odious anti-German propaganda. Not satisfied with this, the caricaturists of the Allied enemies carry on a campaign of presumed atrocities, the murder of women and children by the German Army. The effect of that pernicious propaganda instilled day by day into the masses in the Allied countries is incontrovertible, the stories of atrocities being accompanied by pictures. It would, therefore, be important, from the patriotic point of view, for the daily papers also to occupy themselves by means of caricatures with the principal events of the day.

The idea of such propaganda has been conceived by the Supreme Military Command, and it is therefore desirable that all should conform to it. The official cinema has been ordered by the Supreme Command to enter into direct communication with the daily press, and many leading newspapers have hastened to express their readiness to insert these patriotic caricatures, for the drawing of which the services of the best artists in Munich and Berlin have been secured. These caricatures will regard chiefly the heads of state of the Entente Powers, their political leaders, and those who make no mystery of their hatred for Germany. The blocks will be supplied free of expense.

Minstrelsy in Macedonia

By H. Collinson Owen (Editor of *The Balkan News*).

"The roses rahnd the door
Make me love Mother more. . . .
Whenagetbaek
Whenagetback
To ma home in Tennessee".

IT was the first time I had ever really caught the astounding words of "Way down in Tennessee." They were being sung with great earnestness by a young, pleasant-faced cockney sailor who stood near the breech of a 9.2 gun on a tiny improvised stage. There was bunting all around him and somewhere behind was concealed the orchestra—an accordion. The occasion was the second birthday of one of our small and more exotic ships of war.

"I think," whispered the Skipper as the wonderful song finished, "that we'll go aft when the interval comes, and leave the rest of the concert to them." A little later a group of us sat in deck chairs, energetically grasping whiskies and sodas, and looking over to the twinkling lights of Salonika. The sounds of the concert came more faintly to our ears.

"It is the best we can do," said the Skipper. "We've no pianos or concert parties and things on this ship. . . . Not a bad show, considering; and the men enjoy it." Then we talked of other things, including the war.

* * * * *

That mostentatious little ship's concert is but one of some scores of entertainments that I have attended in and around Macedonia, and only in casting the mind back is it possible to realise how much the men of this army have done for themselves in relieving the intolerable tedium that comes of a long campaign in a wild and comfortless country. Some eighteen months or more ago I was present at a concert at a Corps Headquarters, which at that time was fairly near to Salonika. The stage, artfully contrived with electric lights and all sorts of other "gadgets," was set at the foot of a slope, and rising from it were tiers of semicircular seats cut in the hard red ground. In the front row sat generals, laughing as heartily as schoolboys at the efforts of the comedians. Behind the few hundreds of seated officers were standing some thousands of men, all in the very best of humour, and forgetting for the time being that the war had brought them to a strange country where they found themselves "up against" many novel and disconcerting parts of life. The jokes from the stage brought with them a pleasant whiff of London or Birmingham or Manchester; references to local conditions down in Salonika evoked roars of delight. Even the distressing subject of quinine provided mirth—and still provides it, by the way. Shortly after the show started a huge moon topped the hill behind, looking down on the twinkling little theatre with its intent audience, and making a scene of calm and sweet beauty that belied the discomforts of the scorching daytime.

But that was at a Corps Headquarters, and a Corps can be expected to do things. Since then concerts and revue parties have multiplied exceedingly, and units of much less majesty than a Corps have their own concerts or revue parties. It has long been accepted that entertainments behind the lines are an excellent thing for everybody concerned, but although the principle is all right, the practice of it is not an easy thing in Macedonia. Practically everything has to be improvised. No wandering parties of London "stars" come out here, but officers and men have found their own talent, and plenty of it, and of surprisingly good quality all.

Costumes and Artistes

The question of costumes is one of considerable difficulty, and many have been the expeditions into Salonika to find things that often Salonika does not possess. But all difficulties have been got over. In this new and extraordinary army of ours it is always possible to find the right men. A hospital orderly reveals himself to be, in private life, a scene-painter of merit. Perkins, a mule-driver, proves to be a member of a well-known Folly troupe, with a much more graceful cognomen to help him through his professional career. Lieutenant Wunpip, of the Southshires, had a mottled career up and down the American continents, and danced two years for his living in New York music halls. All sorts of odd people discover themselves as capable, even soulful, musicians. Aladdin could not have done better. The O.C. Concert Party claps his hands, and the right man appears.

Each troupe boasts that its particular "ladies" are the best that Macedonia can show. Feeling on this matter sometimes

runs high. Pride of fairies in many cases is second only to pride of regiment. There are earnest O.C. Concert Parties who will assure you with a quiver in the voice and almost a tear in the eye, that their particular Fifi or Mimi (the influence of our gallant Allies is extraordinarily strong in these matters) or whatever her name may be, is incomparably the best that ever kicked a high heel or showed a hint of *lingerie* on a Macedonian stage, and that a ten-hour journey up country to see her is a bagatelle compared with the delight that awaits one on arrival. They insist on impounding you on the spot, to come and see what Mimi can do.

Musical Comedy

I was certainly amazed on seeing my first musical comedy star of the Balkans. I do not pretend for a moment that she could have played with success the leading rôle at the Gaiety or Daly's. But she would certainly have been welcomed in the first row of the chorus. Tall and willowy, hair of gold, expressive eyes—only the voice slightly marred the general effect, and even that was really not so bad. It could easily be reconciled with the idea that the leading "lady" had a slight cold. Since then, I have seen a score of Fifis, and some of them have even been a big improvement on the first. There is one beauty chorus in particular which makes subalterns wonder if they are dreaming. And it is quite impossible while the show is in progress to realise that those delicate young creatures are stalwart young men who drive heavy motor lorries or throw bombs at the Bulgar. It all seems to show that English beauty is essentially masculine. Take a likely looking young man and dress him up suitably, and he makes quite a pretty girl. But then, only the ghosts of the burnt-out millinery shops in Venizelos Street could tell to what lengths the indefatigable O.C. Concert Parties have gone in order to obtain verisimilitude. And not even the fire has daunted them. They are at present busily scratching round among the ruins trying to find the necessary "props" for the opening of the winter season.

To realise how much the Minis and the concert parties and the musicians of the orchestra mean to the Army in Macedonia it is only necessary to try and imagine what existence would be like without them. To many thousands of men they are the one link with the gaieties and the comparatively care-free existence that they knew before the war. Tommy is grateful to the men who have sufficient talent to provide these distractions for him, and for his part would willingly see them doing nothing else, but as a matter of fact, practically the whole of this work is done in the spare time of the officers and men so engaged.

Certain leading troupes have long ago attained the dignity of touring companies. When their work is done they load up their properties with all the celerity and expedition of a ration party hurrying up to the firing line, and start off for some out of the way spot where the local O.C. and his men are waiting a-tiptoe for the fun of the evening. The Home O.C. probably has guests for dinner and a special spread that evening. The O.C. Concert Party probably eats a sandwich or so the while he gets into his footlight toggery, and superintends the erection of the stage. Even when the show is finished his trials are not over. The Home O.C. in honour bound makes a speech of appreciation and thanks. A dreadful stillness descends on the hall of mirth. Audience and company alike look frightfully embarrassed and unhappy. In our honest British way we cannot do these graceful little things without looking as though we have been collectively condemned to death. Relief and joy return when everybody sings lustily "God save the King."

We have long since developed beyond mere concert parties and pierrot troupes—not that these are not excellent in their way. We have an excellent revue, which has given great delight to thousands, various dramatic sketches have been produced, and there have even been pantomimes. The theatrical history of Macedonia, indeed, started with a pantomime, "Dick Whittington," which opened with great success on Christmas Eve of 1915. Dick Whittington made history. The "book" was exceptionally clever from start to finish. The show was given in two marquees placed T-wise, and what was intended merely to amuse the members of a Field Ambulance and anybody who came along, was immediately annexed by a wise General and his Division.

Since then, this new rendering of the old story has, I believe, been played in many parts of the world. Last winter the same authors produced "Aladdin," this time as a divisional enterprise.

Organised on the most lavish scale it was a wonderful success. Night after night the theatre was crowded with men only just out of the front line. Attached to the theatre was a canteen where, in the interval, the men could buy cigarettes and even, on days of great good fortune, beer. The plot was a brand new one, and the villains of the piece were Orosdi and Back, two local shopkeepers—philanthropists whom the men of the Army will remember to their dying day.

For weeks the great pantomime ran to joyous and crowded houses. Every ten days or so the S.S.O. of that Division,

who helped to run the theatre and all its auxiliary branches, appeared in the office and implored me brokenly to come and see the finest show on earth. But alas: it was a three days journey there and back, and by no possible juggling with time was it feasible to produce three daily newspapers in advance. I shall always regret having missed the great pantomime at K—. But, happily, there are already signs in the air which suggest that this winter, too, somewhere or other on the front, it will have a successor, whose brilliance will even outshine the production of last year.

A Visit to the British Fleet

By Lewis R. Freeman

WHILE lunching with Admiral Sir Doveton Sturdee in the course of a recent visit to the Grand Fleet, which must always remain one of the most memorable experiences of my life, I ventured the opinion that the work of the British Navy in sweeping every enemy vessel—warship and merchant steamer—from the surface of the Seven Seas, was the one most outstanding achievement of the war.

"Perhaps you are right," said the victor of the Battle of the Falklands thoughtfully, "but you must not lose sight of the fact that to win this victory over the German the British sailor has had to win an even more remarkable victory over himself. At the outbreak of the war I had every confidence that, in one way or another, we would be able to establish a control of the sea quite as complete as that which we actually have established; but, if anyone could have assured me that the foundations of that control would have to rest upon the Grand Fleet being based in this isolated harbour, with the men practically cut off from intercourse with the world for months at a time, I must confess that I might have been—well, somewhat less sure, to say the least. Certainly I would never have dared more than to hope that the moral of the men of the Fleet, far from being lowered by the most trying experience of the kind sailors have ever been called upon to endure, would actually be heightened. On the score of enthusiasm and 'lust for battle,' there could not, of course, have been any improvement, but this has given way to a cheerful, high-spirited willingness which, if possible, makes the Fleet a more efficient fighting unit with every day that passes. If you will observe well the spirit of the men of the Grand Fleet at a time when the German Fleet—based though it is in the Kiel Canal, where regular shore-leave is easy to arrange—is filled with unrest and threatened with mutiny, I think you will agree with me the keeping of the British sailor in a healthy state of mind and body, without once letting him verge on staleness, is worthy to rank as an achievement with that of keeping the enemy off the seas."

High Spirits

Evidence of the high spirits of the men of the Grand Fleet I had been having from the moment I sighted the first car-load of returning-from-leave sailors on my journey up from London, but the occasion on which I was the most impressed was the morning on which I was allowed the honour of helping to coal ship by wheeling 2-cwt. sacks on a barrow for a couple of hours, an experience the memory of which promises long to outlast even the not unlingering stiffness of my dorsal muscles. The ship had not been ordered, and was not expecting to be ordered to sea, and there was no reason to rush the coaling save to be free to take up some other of the regular grind of routine drudgery next in order.

I have watched warships coaling in many ports of the world, but never have I seen men working under the stimulus of extra shore-leave at Gibraltar, Nagasaki, or Valparaiso get the stuff into bunkers faster than did those lusty men of the good old "X—" that misty morning in the Skager Floe. Almost every man who was not smoking was singing, and even out of the dust-choked inferno of the collier's holds, the beat of chesty chorus welled up in the pauses of the grinding winches.

Time and again (until I learned how to defeat the manoeuvre) men behind me in the line pushed their barrows in ahead and made off with sacks that should have been mine to shift, and time and again (until I had found my second wind and my "coaling legs") the rollicking Jack Tar just behind me put his speeding barrow into one of my by no means slow-moving heels. The several hundred tons of coal which went into our bunkers between 7 a.m. and 9 a.m. on that ordinary "routine" morning, was shifted at a rate that would have

been entirely creditable to a crew filling their bunkers for a long-deferred homeward voyage.

I did not have another opportunity to discuss with Admiral Sturdee the manner in which the miracle of "Fleet moral" had been wrought, but an officer of the battleship on which I stayed summed the thing up succinctly.

"I quite understand," I had said, "why the physical health of the Fleet should be the best ever known—why no battleship averages more than two or three sick at a time. The long months away from the germ-laden air of the land is sufficient to account for that. But how, after these three years and a half between the Devil, the Deep Sea and the Scotch Mist, the men are still exuberant enough to want to push barrows of coal faster than a landsman, like myself (who is pushing for the sheer luxury of the thing), or how they are still full enough of *joie de vivre* to enjoy fits of singing between fits of coughing in the hold of a collier, is beyond my comprehension. How did you do it?"

The reply was prompt and to the point, and seems to me to disclose the secret in a nutshell. "By giving them," he said, "both more work and more play than they had in peace-time; in other words, by cutting down to a minimum the time in which to twirl their thumbs and think."

Work in War Time

"Outside polishing brass and holystoning the deck," he went on, "there is a deal more work on a warship in war-time than in days of peace, so that we are never hard put to find a field for extra effort. We learn much quicker from practice than we did from theory, and there is an astonishing amount of work going on all the time to the end that the ship shall be kept as up to date as possible in all her equipment. The increase of a ship's offensive and defensive power, making her better to fight with and safer to fight in is naturally a work in which the men are vitally interested, and they go into it with a will. We try as far as possible to avoid simply putting the men through the motions of work, like doing unnecessary painting or scrubbing, for instance. If the ship does not provide for the moment enough real work, we try to find it ashore. For the next few days, for example, we are sending several hundred men ashore to make roads on one of the islands. They are very keen about the change, and I have heard them speaking about it all to-day. That kind of a thing works much better than simply improvising work on board. It gives variety, and the men feel that they are doing something useful instead of simply being kept busy."

"So much for work. On the score of play, we aim to give the men rather more athletic sports than they would have in port in peace-time, though all of it has to be carried on with many less 'frills'—flag-dressings, tea-parties and the like—under the limiting conditions of always being ready to put to sea at notice of an hour or two. On the ship, doubling round the deck for exercise is kept up regularly, as is also a certain number of Swedish drills. Every encouragement is given to the men to box, and the ship, squadron and Fleet championships in the various classes are, of course, great events. There is scarcely a drifter or patrol-boat without one or more sets of boxing-gloves, for there is no form of sport quite as well calculated to exercise both mind and body in restricted quarters.

"Water-sports—swimming, rowing and sailing—are kept up about as in peace-time, though here the long spell of inclement weather makes the winter rather a longer 'closed season' than farther south. Ashore there are several indifferent cricket and football grounds, though not, however, nearly enough for the normal demand of the great number—it runs well up into six figures—of able-bodied, sport-loving men in the Fleet. A good deal of hockey is played, and we

have found it a better wet-weather game than football. In all of these sports inter-ship and inter-squadron rivalry is encouraged, principally because it stimulates the minds of so many outside the actual participants.

"Many of the officers have their golf clubs and tennis racquets, and though our links and courts would hardly satisfy the critical eyes of St. Andrews or 'Queen's' professionals, they have been a big help to us. Cross-country runs and paper-chases, up and down the steep hills and over the soggy peat bogs, are taken part in by both men and officers, and for flesh-reducing, muscle-hardening and chest-expanding are about the best thing we have. The tug-of-war is a traditional Navy sport, for it can, if necessary, be enjoyed on shipboard as well as ashore. The great pride which the men of a ship take in the success of its team makes this also a very useful sport for its 'psychologic' value.

"Amusements pure and simple—the kinema and theatricals—are a new thing with us (at least while on active service) and the scheme is still in process of development. For a number of reasons it is impracticable for professional troupes to visit the Grand Fleet in the same way as they have been going to France to entertain the Army. The greater distance is against it, as is also the fact that we have no place to put them up. Again, as there is no place where they could perform to more than a thousand men (at the outside) at one time, it would obviously take some months to make a round of the Fleet. The fact that the visitors might awake almost any morning to find themselves on the way to a seafight is also a deterrent. All of these things have made it necessary for us to shift for ourselves in the matter of entertainment.

"Each ship, of course, has always had its band and orchestra, and concerts and rather crude theatrical shows have been features of Navy life from time immemorial. The trouble with the shows, however, has always been the amount of improvising that they entailed, especially in the matter of a stage, footlights, seats and the like. Before the war the men usually managed to find time to paint and rig 'flies' and 'drops,' devise lighting effects, and even to fix up some kind of auditorium. Here, with the whole ship standing by for orders to put to sea, all of this was out of the question. Under these circumstances, the man who first conceived the idea of a special 'theatre ship' deserves a monument as a benefactor to the British Navy.

"The suggestion was to provide a steamer on which a permanent stage, complete with sets of scenery, exits and entrances, footlights, sidelights and dressing-rooms, had been installed; also sufficient seats to accommodate as many of the crew of a battleship as could ever be off duty at one time. The thing would have been worth while a dozen times over, even if it had been necessary to detach a three or four thousand-ton steamer for no other purpose. Luckily, the plan chanced to dove-tail to a nicety with the functions of a steamer which, in carrying frozen beef to the Fleet, laid alongside each ship for from twenty-four to forty-eight hours. The stage, auditorium and the rest were built without interfering in the least with the steamer's regular work, nor have the some hundreds of performances already given aboard been responsible for the least interruption in our supply of frozen beef. As for the shows, she is discharging to the 'X——' of our squadron to-day, and you can go over to-night and see one for yourself.

Kinemas and Films

"The trouble with the 'theatre ship' idea is that it is too long between shows. Between the battleship and the endless auxiliaries, it may easily take from two to three months for the beef-cum-theatre steamer to make the full round of the Fleet, an interval which we had to find some way of bridging with other entertainment. It was a difficult problem in many ways, and it is only within the last month or two that we have found—through the kinema—a satisfactory solution. Every ship in the Fleet has now its projector, and, through an organisation formed in London for that purpose, a continuous supply of the latest and best films is sent up and circulated at a cost to us that is almost negligible. The films on arrival at the Depot Ship which houses the Post Office, are listed and filed, to be distributed to the various units in accordance with their demands.

"Each ship has a daily bulletin of the new films arriving, and at once sends in an application for its preference, with two or three alternatives should the first choice have gone to a prior claimant. The scheme has been successful beyond words. Each ship has a nightly performance, and of the officers on Saturday. All share in the cost of it, which only comes to a shilling or two per head a month. With a little larger supply of the more popular films, the development of this kinema scheme promises to give us everything we could possibly ask on the score of evening amusement. About

the only thing left to do would be to buy a few picture-taking machines, let the officers and men write the scenarios, and start making films on our own account. If it turns out that we're to be here another year or two, I don't doubt that's what we will be doing."

The Theatre-Ship

"There is not a great deal that I can add to this comprehensive summary of the way work and play have been administered with such success in maintaining the moral of the men of the Grand Fleet. The show on the "theatre-ship" that night I found well worth the wet launch trip in a sloppy sea. It consisted of two parts of varieties and one of burlesque. Most of the numbers had been under rehearsal for several weeks, and the whole affair went off with all the aplomb of a London Revue. No "accessories"—from posters to programmes—were missing, not even the Censor.

An officer sitting next me, calling my attention to the blank back of the programme, said that he had written some "advertisements" to fill it, but that the Censor had banned them at the last moment as "not proper." As a matter of fact, there was far less in the whole show played by men to men, as it was, to "bring a blush to the cheek" than in the average London revue. A certain "chilliness" in the atmosphere of the auditorium, due to the fact that it was situated immediately over one of the refrigerating chambers, was more than neutralised by the warm reception the packed audience gave the show from the opening chorus to "God Save the King."

I managed to spend a few minutes at the nightly kinema show on several battleships. All of the available seats were invariably packed, with the enthusiasm tremendous, especially for the "knock-about" pictures. Charlie Chaplin appeared to be a ten-to-one favourite over anyone else—both in the Ward Rooms and on the Lower Decks—and the demand for films in which he figured was a good deal greater than the available supply. The "sentimental" Mary Pickford sort of films were rather more popular than the men cared to show by their applause, but the harrowing "suffering-mother-and-child" subjects they would have none of. A rather poor film of Rider Haggard's *She* which I saw was very coldly received by both men and officers. The Official War films of all of the Allies were always sure of a rousing reception. A special treat was the picture of the King's recent visit to the Grand Fleet, which offered men and officers the exciting sport of "finding" themselves on various sectors of it. Travel films were in little demand, the reason for which was perhaps supplied by one of my coaling-mates, who said that the only kind of travel "movie" that he was interested in was the woods of Scotland running north at sixty miles an hour past the window of his homebound train.

Besides the more or less organised forms of work and play, many of the men in the Fleet have some sort of a hobby to which they turn in the rare intervals which might otherwise be spent in "thumb-twirling" and "thinking," those twin enemies of "The Contented Sailor." Thousands of men "make things"—not the old ship-in-a-bottle seaside bar ornament sort, but objects of real usefulness. One officer had become a specialist on electrical heating contrivances, and had equipped the Ward Room with cigar lighters to work with the ship's "juice" and save matches. Another was making his own golf clubs, and I heard of a Captain of Royal Marines of noble lineage who had fabricated a very "wearable" pair of Norwegian ski-shoes. There are so many skilled artisans among the men that one is not surprised to see them making almost anything; nevertheless, the gunner of one of the battleships who—with the sole exception of the lens—made a complete kinema projecting machine, did a very creditable piece of work.

Some of the Senior Naval Officers have gone in for stock-breeding, overflowing to the land in their endeavours to find room to expand. Pig-raising is the most popular line, and there is great rivalry between the several "sty proprietors." A certain distinguished sailor—his name is a byword to the English people—discoursed learnedly to me for fifteen minutes on the strategy of the Battle of Jutland, and then, turning to a visiting officer, spoke with equal facility, and even greater enthusiasm, of his success in crossing the "China Poland" with the "Ordinary Orkney" to increase (or was it to reduce?) the "streak" in the bacon. He called the new breed the "Chinorkland," or something like that, and if the fact that he was planning three or four generations ahead conveys anything as to the view the Navy takes regarding the duration of the war, my readers—with the Censor's indulgence—are welcome to the tip.

The King has sent a cheque for £200 as a donation to the special Christmas appeal which is being made on behalf of the Y.M.C.A. It is hoped by this special appeal a sum of half a million sterling will be raised before the end of the year.

The Beauty of Zeeland Waters

By a British Prisoner of War

BEFORE the war every owner of a small cruising yacht, while poring over maps and charts, must have found often his attention drawn to the maze of islands in the estuary of the Scheldt and Rhine. This applies, of course, not to the racing yachtsman, but to the possessor of the seaworthy vessel, comfortable rather than swift, and designed for sheltered waters and coast-hugging cruises.

There could, indeed, be few places more perfect for a sailing expedition than these Zeeland estuaries, so broad that from mid-channel the land is only a thin bar dividing water and sky. It is a quaint primitive country with clean harbour and villages and friendly population of farmers and fishermen. There are old towns, beautiful but not squalid; with names faintly familiar in history. Ancient dress and customs survive, not at the instigation of financiers for the benefit of tourists, as in some of the show places of Holland, but simply and sincerely because the people have no desire to change the ways of their ancestors.

In these days the whole district is under strict military supervision, and only recognised traders are allowed to pass unchallenged. There are forts and minefields guarding the mouth of the Scheldt, and Vlissingen, or Flushing as we call it, which stands at the mouth of the estuary, is not only a landing place for Continental travellers, but also the second naval port of Holland.

It was for these reasons that two of us, interned British officers, were pleasurably surprised to receive permission to join a sailing party, whose course lay between Dordrecht and Flushing. Perhaps the knowledge that we had left the regular service several years before the war, as well as the confidence placed in our hostess, influenced the authorities in their generous decision. Friends in the Dutch army told us that it was all a mistake and that we should never be allowed in a military area so vigilantly guarded. But our passes gave us the freedom of all Zeeland, and on the strength of that we made our preparations and journeyed down to Dordrecht, where the boat awaited us.

A Sleepy Port

Dordrecht is a sleepy inland port, whose salient features, still unchanged, are familiar from the canvasses of Albert Cuyp. Some of the streets are narrow and winding, and the tall houses that lean together over the waters of a muddy canal give a Venetian effect. But it is a grey and northern Venice, and one soon emerges from these tumble-down antiquities into rows of modern shops or large ornamental villas. We went on board the evening before we started, and spent the night in a stagnant little harbour, surrounded by yachts and barges, and overshadowed by the great church with its famous stunted tower and a spread of slate-roofed aisles.

A huge volume of traffic still passes the sleepy quay's, where farm produce and the wares of several factories are perpetually being laden. Dordrecht stands at a crossway of canals that bear the commerce of Rotterdam and the Rhine. The modern activities and enterprise of Dordrecht were indeed forcibly impressed upon us at the outset of our travels. First we were held up before the big railway bridge over the River Maas that only opens five or six times a day, and a small canal just behind us discharged into the main waterway the greasy refuse of a butter factory that stood on its banks. We passed the steel obstruction, only to be met by another equally unyielding. The skipper suddenly announced that he must wait the turn of the tide, and made fast alongside a deserted quay opposite a sprawling oil factory. However at last we found ourselves tacking down the Dorde Kil towards the Hollandsche Diep.

The Dorde Kil is a broad canal with green banks neatly paved at the water's edge. Tall reeds grow in shallow creeks, and silver poplars throw their shadow across the water. The breeze was light, and such as it was it blew against us, making progress slow. Our craft was a stout sailing vessel of about fifteen tons with a good spread of mainsail and a single jib. In a fair breeze her sailing powers were better than critics might have supposed. She had started life as a humble trader, but now her cargo space was divided into a pair of cabins and a large saloon. Her sides and mast were varnished and the state of the decks and bright-work would have been creditable at Cowes.

It was a hot day and, as the afternoon wore on, less and less wind found its way to the sheltered canal. Some of the sailing barges, especially those deep laden, had wisely anchored, but others drifted to and fro, their spars gybing and

their course uncertain. The seamanship of the Dutch barge-men has an appearance of almost negligent indifference. They are wary and experienced, but they take no pride in an exercise of skill. No rivalry exists between them. Their duty is to convey cargo from port to port, and with the bare performance of their duty they are content.

We passed through a prosperous country. The roofs of neat farms and houses were visible over the high banks of the canal, but the view beyond was often obscured by the trees near the water's edge. At about five o'clock a steady breeze filled our sails, and the barges that had lain sleepily on the glassy water during the stifling hours now awoke, and as we passed we heard the steady clank of winches weighing anchor and hoisting sail.

Narrow Waters

Tacking across a narrow stretch of water is tedious work. It is tedious for the steersman ever wondering if he dare trust the wind and attempt to weather such and such a point, or pass ahead of such and such a craft, that for half an hour has hovered in front of his bows. It is tedious for the hand at the fore sheet, and even for the passengers, roused every few minutes by the heeling of the boat and the swinging of the boom. When, however, traffic is passing to and fro, then the task of the man at the helm is magnified tenfold. On this occasion a tug with an interminably long tow of three barges held a steady course down mid-Channel at a speed that seemed neither to draw ahead nor drop behind. We drifted for a while till the obstruction had passed us, and then we could tack once more across the full breadth of the canal. At length a long stretch, now lively with moving craft, was left behind and open water lay ahead. The flat land on the far horizon was misty blue in the distance, and the surface of the grey waste was lashed into tiny waves by the wind that the trees had deflected from the canal. We stood out till only a small scar of land was visible between the sky and water.

The wind dropped again towards evening, and we approached the shore. The trees and meadows that had been a grey monochrome became green once more; deep green for the elms and poplars, and light emerald for the sunlit grass. The tide was ebbing fast and sand banks lifted their backs like monsters rising out of the deep. We sailed on steadily, the tide with us and the water gossiping idly to the planks. Ahead of us the sun was sinking through fleecy clouds surrounding an island of the palest blue, and the glow of the slanting rays lit up the east, where the clouds became half transparent like amethyst. There was a silence here which seemed, because we were in sight of land, more deep and more intense than the silence of the ocean in moments of calm. The distance swallowed up all sound from the shore, and in the presence of land and ships the stillness that our voices broke became more real and vivid.

After a while the spell was broken. We had been watching a tug with two long hulks that had been steering eastward. Suddenly, with a harshness mellowed by the space between us, we heard the roar of a surging cable. They had anchored for the night, and as the two long hulls swung round with the tide, for a few moments the tarred sides seemed to gather all the failing sunlight into twin glistening gems. It was gone as they yielded to the moving water, and their shapes grew vague and shadowy against the sombre clouds. Then we heard the steady beat of a propeller, the shearing of a steamer through still water, and like an echo came the fall of the bow wave upon the shore. The reflection of the bows gave a false impression of their height, and we thought that a large ship was approaching. But as it passed it sank to insignificance and hurried out to sea as though ashamed of the deception. The light was fading and the water had the grey brightness of high-polished steel. Here and there we saw the rolling backs of porpoises, and seals were just discernible on the sandbanks. The sun was soon lost behind a heavy bank of cloud, but once it shone dimly through the obscuring curtain. It was dull red, like heated iron, and a dark bar lay across its face.

Then in the midst of the darkening waters we cast anchor for the night. The tide had turned and was soon racing inland. It stretched the cable taut and swirled noiselessly past our sides. Two of us bathed from the dinghy, and raced back to the ship with the current. To swim against it was impossible. The water was warm, for the sea keeps its heat in the night, and it had a brackish taste.

There was strange softness in nature, in the quiet colour of the clouds and the pale reflecting water. Light breezes, soft as velvet, passed gently through the night and made no stir.

Searchlights, possibly as far distant as Antwerp, flashed across the sky, and there was a fitful play of summer lightning. But the air was fresh and mobile, without the sullen gloom that precedes a storm. Nature was asleep and breathing softly.

On waking next morning we found ourselves under way, heeling over to a brisk wind and scudding through small snapping waves. We were in a narrow passage, steering parallel to a neat shore with treeless pasture overtopping a rocky seawall. There was a sandbank on the other beam, where gulls strutted. It was dry and even, an ideal place to bathe from, or for children to dig castles. In one place a few buried planks and ribs scarred its smoothness and betrayed its menace. The land fell away and on either side there was open sea, and ahead a long island, set meekly on the horizon as though it felt that its very life depended on the pleasure of the capricious waves. Clouds were spreading over the sky and soon they had hidden the sun. The sea was grey and choppy; dirty rather than stormy weather.

It was Walcheren that lay ahead; a name sinister in English history. One thinks of it as a bleak island, with sand dunes, and fever-stricken marshes, and isolated forts, and half-savage population. Actually it is wooded, and fertile, and peaceful as Kent or Surrey. There are two unforgettable land-marks that rise clear from the flat soil of the island. In the forefront stands the huge church of Veere, and far behind, faint and slim, is the distant spire of Middelburg.

A Dead City

Veere is a dead city. The great church, weary and alone, like the arch of Ctesiphon, bears sorrowful witness to the past. The cottage roofs seen through the foliage of surrounding trees are weak and insignificant, like the muddy Arab towns built upon the dust and rubbish of Bayblon.

Veere stands at the mouth of the Walcheren canal, which bisects the island, passing through Middelburg and on to Flushing. But the traffic goes by regardless of the scattered village that was once a busy port. We awaited the opening of the iron gates in the granite locks and then made fast alongside a plank landing-stage in company with a fleet of barges. The wind had dropped so we stayed there till the evening. The weather had become dark and forbidding; clouds surcharged with rain massed in from the open sea and spread over the island. Downpours, straight and arcing as tropical showers, are common in Holland. The clouds break and empty themselves like reservoirs suddenly overturned, and an inch of rain falls in half an hour.

At close quarters the church seems larger and more pitiful than in the distance—more than ever like some prehistoric monster, aged, and impotent against a host of midget foes. There was some scaffolding round one end and planking had been erected where the tall railings had been destroyed. The walls were a dingy colour, like khaki, and coarse flowers grew in crevices and on the solid buttresses. Once the exterior had been decked with carved figures, saints and gargoyles and ornamental sculpture. Ornateness would have relieved its dull proportions, but the work of the Netherlands iconoclasts was thorough, and not even in the highest niche had a statue been left to offend the stern Calvinist eye. The long windows were filled with pale green glass, a common practice in Holland, and the walls within were a desert of whitewash. The whole fabric was chipped and battered, but its solidity seemed unimpaired.

Some of the larger houses in the cobbled streets may have been old, and they were certainly roofed with mellowed scarlet tiles. But they were small and unimpressive; one-storied dwellings built perhaps from the pillage of ruins. Along the quay of the little harbour, where a few barges lay on the mud, we found traces of past days. The guildhall of the painters, with its elaborate façade, is now a museum and temporarily a barrack. In one of the shops, behind a pile of merchandise, we had a glimpse of carven arms above a filled-in fireplace, and, facing the sea, a rambling inn has grown upon the remains of an older building. The Gothic *stadhuis*, with its delicate tower of stone and copper, its pointed roof, and stiff carven figures, remains un tarnished. The small municipal business is still transacted here, and amongst its antiquities is a golden cup given to Veere in 1551 by Maximilian of Burgundy.

Veere is still unspoiled by sentimental and commercial endeavours to revive its ancient glories—or rather to build upon those fragments a modern villadom. A few painters stay there and tourists come from Middelburg if they have an afternoon to spare. The inhabitants are an old-fashioned race, clean and simple and industrious. The women are sturdy and beauty is measured by the redness of thick arms which the mediæval dress leaves bare above the elbow.

Later in the evening, when the clouds had dispersed, we were towed to Middelburg. The Walcheren canal is an artificial waterway with long stretches and geometrically

even banks. Old guns have been driven into the turf parapet at distances of about two hundred yards, guns that a hundred years ago may have borne their part in repelling our ill-fated expedition.

Middelburg, the capital of the province of Zeeland, is, as its name implies, in the centre of the diamond shaped island. It is quite a large town. The old historic streets spread over a big area and modern suburbs reach out in all directions. Not only in its buildings, but in all its life, Middelburg, in the truest sense of the word, is an ancient city. The spirit of the Middle Ages lives on, a refined and idealised survival, with the dirt and brutality of old days discarded. Life is quiet and safe and undisturbed in this changeless city. The fragments of past ages are frequently show places—dead things whose bodies are preserved—or else they are surrendered to poverty and squalor. But Middelburg has more than isolated relics. Business is discharged in the *stadhuis* built by Charles the Bold, and the citizens live in solid houses with long eaves and lattice windows. They appreciate and guard the charm of their city by reproducing in new buildings the form and spirit of the old. A few slums remain, but these are still as they were when first constructed, tiny dwellings for poor men. There are no palaces sunk to tenements or churches used for storing hay.

(To be continued.)

The Late Edward Thomas

To the Editor LAND & WATER.

SIR.—Your appreciative notices of my late son, in connection with his posthumous works, *A Literary Pilgrim*, and his poems, lead me to think that your readers might be interested in some particulars as to the manner of his death which have not yet been published. Prior to the British offensive at Arras on Easter Monday last, when he fell, Edward Thomas had borne his part in the great artillery duel. His group of batteries had been singularly successful and made a big bulge in the German line, so much so that his Commander in notifying his death said that he had fallen in a moment of victory—"a gallant death for a very true and gallant gentleman." The strange fact is that his life was taken away by a shell that left his body unscathed and thus his comrades were able to bury him in a soldiers' cemetery at Agry, carved out of a delightful little wood. It was his good fortune, as a famous nature-lover to be laid to rest under the trees, with the birds that he knew so well carolling on the branches. "As we stood by his grave," writes his Commander, "the sun came out and the guns around seemed to stop firing for a time. This typified to me what stood out most in his character, the spirit of quiet, sunny, unconcerning cheerfulness."

One of his corporals, who came home to receive a commission, has told us that his men would have followed him anywhere owing to the confidence he inspired. When the news of his death was brought back to the battery, the messenger cried out! "Lads, we have lost our best officer"; to which a chorus of voices responded: "Not Mr. Thomas!" The wheelwright of the battery executed a special memorial for his grave. Six months later his commander finds himself again in the neighbourhood and pays a visit to the grave of the poet-soldier. He writes: "I felt very happy about him resting there, because I felt it to be just the kind of place that would have appealed to him by its quiet beauty. The grave was well cared for, but looked rather bare, so to-morrow I am going there again with two men who knew and loved him . . . and we are going to turf it and plant a few shrubs round it." One hardly knows which to honour most, the brave soldier who fell, or the commander who can cherish such a pious memory for his dead subaltern. At least, one loves to think of it as characteristic of British chivalry.

As a man of the open air Edward Thomas had inured himself to extremes of heat and cold and wet. He reacted splendidly to the drill and training of the soldier, so that one of his best friends, who knew a soldier when he saw him, could say of him: "This man was a born soldier." Let me add that he volunteered for the army in the first months of the war and was determined from the beginning to get as soon as he could to the battle front. His Celtic clairvoyance told him his fate. The poetry which he then began to write, under a greater intensity of spirit, is touched by a feeling of farewell, as also by a certain melancholy that was natural to him. At the same time he had an iron courage that never looked back. In these days there are people who will say "This man did not boast or brag, he must have been a nonentity." Though his father, I venture to say that any who read his works can trace in every line the hand of the gunner who could die facing his country's enemies and regulating the fire of his battery.

Faithfully yours,
Rusham Gate, Ballham, S.W.12.

PHILIP THOMAS.

Life and Letters

By J. C. Squire

Irish Memories

THE large sect which reveres the "Irish R.M." books will automatically buy *Irish Memories* (Longmans, 10s. 6d. net), the last book which will bear the names of E. G. Somerville and Martin Ross. Miss Violet Martin, "Martin Ross," died a little time ago, and the new volume has been written by her collaborator, with the help of some of Miss Ross's letters and papers. It is a book, however, with less of a general appeal than one had expected. A good deal of it is family and local history, dealing with persons who are not of sufficient note to be interesting to English strangers, unless treated with that fullness which will make almost anyone interesting. Miss Martin's family was very clever, and still more numerous—she herself was the eleventh successive girl, and was received into the world, she alleges, with the least amount of rejoicing on record—but the material here given is insufficient to intrigue one with any of them except her mother. That lady, who was very caustic about her daughter's early literary attempts, was, it is said, imposing, slow and stately to a remarkable degree:

It was alleged by her graceless family that only by aligning her with some fixed and distant object, and by close observation of the one in relation to the other, was it possible to see her move. One of the stories turned on the mistake of one of their children, short-sighted like herself. "Oh, there's Mamma coming at last!" A pause. Then, in tones of disappointment, "No, it's only a tramcar."

In any book by these hands there were bound to be sufficient anecdotes of that kind to make it worth the reader's while to go on, and Miss Somerville scatters them freely. She does not specialise in "bulls," but gives a good one from a tenant who said that he had "a long serious family, and God knows how I'll make the two ends of the candle meet." But about her chastest tale is that of the deferential lady at the garden party, who said to her host: "Oh, what a handsome sunset you have."

* * * * *

The two ladies were of old Irish landowning families, and took the point of view, political and social, of their class, though never in a purely mechanical way. "Martin Ross," at the end, was remarkably open on the subject of Home Rule, and the correspondence between her and Captain Gwynn, M.P., here given, shows how little it really is that differentiates the best minds on each side. But what one really wants from this book is not new light upon Home Rule, or the Irish Famine, but something which will illustrate the workings of one of the closest and most puzzling collaborations on record. Here Miss Somerville, although with all the airs of candour, is a little reticent. She gives us the history of the partnership. She tells us what they got from the publishers for their early novels—and the prices were larger than they would have obtained in these days of reduced prices and enormous over-production—and she is very amusing about the stupids who were continually asking them "which one held the pen." She suggests—as has been revealed before—that the co-operation between the two was extraordinarily close, and that each word, almost, was debated between them; but she does not really show us the thing happening. We are left to make our own deductions from the specimens of writing by each separately now given, in which the components of the mixture separate out and are revealed as very distinct from each other.

* * * * *

Explanation or no explanation, the results of the partnership will always be a puzzle. Generally speaking, collaborators write alternate chapters; or one writes the dialogue and the other the descriptions; or they sink their differences in some method which is quite impersonal. The queer thing about this pair is that they produced a style, which was the style of neither of them, and which nevertheless had an individual personality written all over it. That personality was more vivacious and irresponsible than "Martin Ross's"; more thoughtful and sagacious than Miss Somerville's; and the style was terser, more vivid, more flexible than either's. The epithets, the images, the scenes, the very jests seem always things that must have sprung spontaneously from a single mind; were it not that *All on the Irish Shore* and some others were written before he had been thought of, we should find it easier to believe that Major Sinclair Yeates was a real person and author than that two women had sat solemnly down to concoct their tales with interminable discussion. It was a great and a mysterious feat.

* * * * *

One has said that the devotees of the Irish R.M. are nume-

rous. They were from the start. During the Boer War a Staff Officer wrote to say that *Some Adventures*, of which he had worn out three copies, had alone stood between him and lunacy; and another copy was found in one of the tents hastily evacuated by General de Wet, to whose credit this must eternally stand. As Miss Somerville remarks, the pair never had anything to complain of in their treatment by the Press. The fact remains that *Some Adventures* and *Further Adventures—The Tinker's Dog* tempts one to include *All on the Irish Shore* as well—are still nothing like as well known as they might be in some circles where they would be highly appreciated. It is all due to people's prepossessions. The titles sound local. The stories are about Ireland, and we have all read enough Irish stories to last us a lifetime. They are, partly, as their title indicates, about the Garrison, and the slightest peep shows that they are largely concerned with hunting. This in itself is enough to choke off many connoisseurs who do not realise that people, especially in Ireland, may hunt without being fools or bigots. Finally, they are liked by many simple people who think Bergson is a patent brown bread, and never heard of Nietzsche before the war. This means that others, who have a contempt for these simple people, cannot persuade themselves that there is anything in the "R.M." for themselves. The fact remains that, in their limited sphere, the best of these stories are perfect in conception and execution.

* * * * *

Of all the characters in them, we are told, only Slipper and Maria were taken straight from life. Maria, being a dog, was fair game. One remembers her greatest exploit, the boarding of the yacht in *The House of Fahy*. There have been many euphemisms about sea-sickness, but none more happy than that with which we are made cognisant of Maria's condition on the yacht:

"She found out that she was able to move," said Bernard, who had crossed to our side of the deck; "It was somehow borne in upon her when I got at her with a boot-tree. I wouldn't advise you to keep her in your lap, Yeates. She stole half a ham after dinner, and she might take a notion to make the only reparation in her power."

No dog has ever been more accurately and exhaustively portrayed; but the invented characters, Major Yeates, Philippa, Flurry Knox, Dr. Hickey, Miss Shute, and Bernard, old Mrs. Knox and dozens of retainers and peasants, have all the force and clearness of good portraits. The landscapes are as good; the humour scarcely ever over-reaches itself, and the phraseology is often thought out with the solicitous care of a Gautier. For an illustration, I open the pages quite literally at random and strike the place in which Major Yeates gets out of an Irish train to buy a fish, the guard promising him that he will have heaps of time for his connection. He hears a whistle and bolts for the station:

Needless to say, it was uphill, and at the steepest gradient another whistle stabbed me like a spur; above the station-roof successive and advancing puffs of steam warned me that the worst had probably happened, but still I ran. When I gained the platform my train was already clear of it, but the Personal Element still held good. Every soul in the station, or so it seemed to me, lifted up his voice and yelled. The stationmaster put his fingers in his mouth and sent after the departing train an unearthly whistle, with a high trajectory and a serrated edge. It took effect; the train slackened. I plunged from the platform and followed it up the rails, and every window in both trains blossomed with the heads of deeply-interested spectators. The guard met me on the line, very apologetic and primed with an explanation that the gentleman going for the boat-train wouldn't let him wait any longer, while from our rear came an exultant cry from the stationmaster: "Ye told him ye wouldn't forget him!"

Or take, again the brisk opening of *The Pug-Nosed-Fox*:

"5 Turkeys and their Mother,
5 Ducks and the Drake,
5 Hens and the Cock.

CATHERINE O'DONOVAN, Skeagh."

A leaf from a copy-book, with these words written on it, was placed in my hand as I was in the act of dragging on a new pair of gloves in the stableyard. There was something rhythmic in the category, suggestive of burnt-offerings and incantations; some touch of pathos, pointing to tragedy; something, finally, that in the light of previous events, recalled to me suddenly and unpleasantly my new-born position of M.F.H.

These are casual extracts; if one picked out the best things one would give a less accurate impression. But if Maria Edgeworth is mentioned in the literary histories, I don't see why these ladies should not be.

Books of the Week

- Prose Papers.** By JOHN DRINKWATER. Elkin Mathews. 6s. net.
The High Heart. By BASIL KING. Chapman and Hall. 6s.
The Rayner-Slade Amalgamation. By J. S. FLETCHER. George Allen and Unwin. 6s.
The Gulf. By HUGH E. SPENDER. (Collins 5s.)
E. A Novel. By JULIAN WINCKLEY. John Long. 6s.

HIMSELF a poet, Mr. John Drinkwater makes rather large claims on behalf of poetry as a factor in everyday life. "We artists have the world to fight," he says in his introduction to *Prose Papers*, and he follows it up by "if the world is to be renewed, it will be renewed by us." This may be so, but such a way of putting it is rather reminiscent of the unheard-of versifier who remarked—"Shakespeare is dead, and Byron is dead—and I'm not feeling very well myself."

With this as a preparatory grumble, we cannot but admit the value of these *Prose Papers*. There is much sanity and new thought—for the majority—in the one entitled *The Value of Poetry in Education*, and, when one comes to Mr. Drinkwater's critiques of his kind, there is real educational value. These range from Philip Sidney to St. John Hankin, and include the Brontës, Rupert Brooke, and Theodore Watts-Dunton, while even Chaucer is given a paper which might with advantage have been longer. "His song was the spring-note of our verse, and into it lie freely wove spring only of all the moods of nature," says Mr. Drinkwater—thereupon he proceeds to prove the statement.

We learn, in process of reading these essays, that their author does not claim that the world will be renewed by poets only, but by artists in the largest sense of the word, and thereat we acquit Mr. Drinkwater of the apparent egotism of his introductory dedication. Many of the prose papers which he has included in this volume first appeared as reviews of collected editions, and the like, but they are well worthy of preservation in more enduring form. The volume might have been named *An Introduction to Poetry*, for in it a seeing man has set down his views of what constitutes poetry, and although material-minded folk may differ with him over some of his conclusions, most readers will thank the author for giving them a clearer conception of values as applied to this "highest form of verbal art."

Since the Canadian point of view is not too well realised, even yet, in many quarters, such a novel as *The High Heart* by Basil King (Chapman and Hall, 6s.) is to be welcomed, for in it a Canadian woman expresses just how the Dominion feels with regard to its place in the Imperial scheme. The days have gone by when Canada was regarded as a dumping place for wastrels, but there is still—especially in the United States—a feeling that the last of the wastrels may still be found north of the border, as is shown in this well-told story. Alix, the very attractive heroine of the novel, resents the American point of view, and her experiences among the dollarocracy make very good reading; her fight with Howard J., the financial magnate who does not want his son to marry her, is epic, while the way in which she disposes of Howard J.'s son after forcing the father to recognise her, makes a fitting anti-climax. There is satire throughout the book, well-deserved satire, and Basil King has a pretty turn of humour which lightens his work from first page to last. And, lest it should be deduced that the book is all in lighter vein, it may be said that few passages in modern fiction can show more of high purpose than the concluding scene.

The Rayner-Slade Amalgamation, by J. S. Fletcher (George Allen and Unwin, 6s.) is a detective story of the conventional type, but is at the same time such a good detective story that it merits more consideration than the majority of this class of work. A certain Allerdyke lands from a continental business tour at Hull with a package of jewellery, and the next morning he is found dead in his room and the jewellery is missing; a concert singer of no small repute loses her jewel case at the same time, with all its contents, and the first clues to the mystery that appear all lead to nothing. Puzzle, find Allerdyke's murderer and the missing jewels—Allerdyke's cousin, a hard-headed Yorkshireman, finds the puzzle practically

insoluble, as do sundry others who try their hands at amateur detective work.

The author has struck the right note in that he has not allowed the personalities of his characters to obtrude too much—there is no Watson in the story, nor is there a Holmes worth speaking of, but there is a network of circumstance in which the would-be discoverers of crime are partly helped and partly hindered by coincidences. Not that one's belief is strained by improbabilities, but the development of the story is on the lines of actual life, the people interested are the people we meet every day, and if any reader should object to four murders in the course of one book, well, the first one made the other three inevitable. It is almost impossible to guess the solution to the puzzle anywhere short of the last forty pages; one may suspect, but cannot be sure. And, since a great number of people always enjoy a good detective story, there should be a large public for this book.

* * * * *

Mr. Hugh Spender, in his latest book *The Gulf* (Collins, 5s. net), has taken for the mainstay of his plot what is rapidly becoming a commonplace—the attraction that may exist between German man and British woman, or *vice-versa*, and the various troubles that arise from such a situation. With considerable courage, the author portrays a good German, a man who hated the barbarities of his countrymen in Belgium, and was so un-Prussian as to prefer death to committing outrages himself, even under orders. Still, he was Prussian, and therefore it is difficult to believe in him—in this is evidence of the detestation of all things Prussian that will remain for the rest of the world after the war. Dramatically, the author pictures happenings in Belgium in the first days, and the chief value of his book is in the way it helps to keep alive the memory of how Germans hacked through a neutral country—for any work that stimulates that memory is of value. It is very obvious that Mr. Spender knows the average German fairly well, and his picture of that being is not a pleasant one. But the book deserves a wide circulation.

* * * * *

A novel with the laconic title *E*, by Julian Winckley (John Long, 6s.), gives one to think. There is in it a touch of Frank Danby, and, since the author is American, it is also slightly flavoured with the R. W. Chambers style, but not much. Then there are blots on construction, such as apostrophes to the "gentle reader," and remarks about "our heroine" which would fit better in a penny novelette—and with it all the book is worth while, for the author has drawn a picture of the rich American and his and her ways with fidelity and insight. There is, as the publisher claims, more than a touch of genius about the book, and perhaps when the author has outgrown his liking for *glitches* he will count among the foremost American novelists. Perhaps, for there is a good deal to outgrow. "E" is diminutive for Edith, an only child of ill-assorted parents, and the book is her history as far as that history is likely to be interesting. The main charm of the book consists, not in its heroine, but in the remarkably diverse group of people who surround her—her father is a very fine character study, and her friend Eloise is another. We look forward with interest to the next work of this author, and hope to see in it manner as good as matter, and also, without any change from the habit of calling spades by their proper names, a trifle more regard for the *jeune fille* and her needs. The book is clever, and its merit outweighs its blemishes.

* * * * *

Links with the Past, a well-produced book issued by the Eagle and British Dominions Insurance Company, deals mainly with the history of insurance, but at the same time contains a mass of interesting information, since the business of the old-time Eagle Company affected many well-known people—Dickens, Charles Reade, Macready, and Mark Lemon were among the earlier clients, the list of whom also includes notabilities of the country, from Queen Victoria downwards. The accounts given of fire engines and firemen of a century ago, of the connection of the theatres with the Eagle company, and of curious claims and awards, make excellent reading; while the illustrations, many of which are reproductions of old prints, form a fitting complement to the text. Perusal of this volume will convince the reader that insurance is far from being a dry business of figures, and that in the history of such a company as the Eagle there lies an unsuspected fund of romance.

'WHEN THE PEACE BELLS RING'

HAVE you thought of what you can do to show your practical gratitude to your boy when he returns from the war? Do you realise that during the two or three years that he has spent in defending your home he has missed the opportunity of working and saving? Wouldn't it give you infinite pleasure and satisfaction if you could tell him on his return that you have saved £10, £20 or £100 for him in order that he may equip himself for the business battle in which he then has to engage? Of course it would. Why not start to-day? You will be glad that you did so.

Folk Art

By Charles Marriott

Pottery

common and plentiful in the country or district that produces the particular form of art; and wood-carving in Scandinavia, knitting in Shetland, and straw-plaiting in Hertfordshire seem a "natural" as cider in Hereford and cheese in Somerset. If the material is not native to the country or district there is nearly always some simple human reason for the development of that particular form of art; and lace-making is more a product of social conditions in Ireland and Devon than it is of conscious artistic enterprise in those places. Therefore, we may say that not only is Folk Art always peculiarly well adapted to particular materials, but that the local form of it is nearly always determined by presence of the material, or by social conditions, or by both.

Without going so far as to say that Folk Art is the only real art there is—though that view might be upheld with some reason—there can be no doubt that an art or a craft that obviously comes from the people and the soil gives a satisfaction and a confidence beyond any other form of art. There is no reason why a young quarryman in Cornwall should not show a talent for painting in water-colours, but we should feel more confidence in his artistic future if he took to granite carving. Whether the art or craft be popular or individual it has always a special character of soundness, perceptible in the finished work, when the artist has a familiarity with the materials beyond his professional use of them. It is astonishing how the sense of this has grown of recent years. In my childhood even in enlightened households it was enough to indicate an artistic career for a youth if he showed a fondness and an aptitude for drawing or painting particular subjects. I believe that nowadays—at any rate, in wise households—the question asked would be: "Has he a fondness and an aptitude for handling paint or pencil?" To put it crudely: as a sign of artistic ability a fondness for messing

MOST musicians would find it hard to define exactly what constitutes Folk Music, and there is the same difficulty about defining Folk Art, as commonly existing in the village handicraft or industry. One characteristic, however, they have in common. Folk Music is always eminently singable or playable on particular instruments, and Folk Art is always peculiarly well adapted to particular materials. Generally the material is one

about with the materials is much more important than the desire to represent anything.

These remarks are prompted by the exhibition of arts and handicrafts recently organised by *The Englishwoman* in Westminster. A large proportion of the exhibits came from bodies formed to revive or encourage village and cottage handicrafts, and most of the works by individual artists belonged in kind if not in circumstance to the class of Folk Art. Always important, the subject of village and cottage industries has become very much more so in consequence of the war. Whether we are prepared for it or not, there is going to be a great increase in village life. As "Jason" pointed out in his article on "What is Reconstruction?" in *LAND & WATER* for October 11th, "capturing German trade" is the least important part of the business. The important questions are: "What is it that men and women need in order to make the most of their lives? What are the conditions of human freedom and happiness and development? And how best can society secure these conditions to every class and every citizen?" Not a bad short answer to all three questions would be: "the provision of a handicraft." With the most intensive cultivation of the soil there will always remain in every village a number of people who from age or sex or physical disability are better employed either at home or in workshops under easy conditions. Granting this, and observing that on the whole the admirable enterprises encouraged by *The Englishman* seem to have escaped them, one perceives certain dangers. There is always the danger that some irresponsible "artist" or group of

artists will go down and start a village art or handicraft regardless of whether the local conditions are suitable. Also there is the ever present, and in view of "capturing German trade," pressing danger of commercialism. You may take it as an axiom that when a man talks about capturing German trade he means for the benefit of the person who "deals in" rather than the person who makes the article. There is no reason whatever why village handicrafts should not be profitable as well as pleasurable, but there is every reason why the profits should go to the right persons. Not merely for sentimental reasons of equity; but for the hard practical reason that a handicraft controlled or even influenced by the dealer is bound to degenerate. A very wise man once said to me that the standard of taste is set by the "buyer" for the big shop. He, and not "the public," decides what shall be worn or used; and therefore the standard of taste as actually represented is always below the average real taste of the people.

Essex Tambour Lace

me, the first care in organising any village handicraft should be to bar the dealer absolutely, and keep the irresponsible artist severely in his place. Though it may not be obvious, the best way to do both is to make everything secondary to the material. Once establish a community of workers in wood or wool or wicker, and you have secured a basis for the co-operative trading that makes the dealer superfluous, and in the same breath you have set a tradition of design proceeding from the stuff itself. Nothing is more healthily stubborn than a tradition so established; and he would be a sanguine person who tried light heartedly to impose new designs on a lace-making district. The

General view of Cambrai.

professional artist can often make useful suggestions, but before they can bear fruit they must be translated into terms of the material by craftsmen who know its "ways" in their very bones.

In all the handicraft exhibitions that I have seen, the products of the loom and the needle struck me as being much better than anything else, and I believe that there are good reasons for this. For one thing, both weaving and needlework compel a close relationship between design and execution. In weaving, the design is a matter of warp and woof, involved in the very structure of the piece; and all needlework designs, from embroidery to lace, are an elaboration of definite stitches. You cannot fudge your design into shape as you can in painting, but must commit yourself with every stitch. Properly speaking, of course, a painted design should be built up of definite brush-marks; and there is an absorbingly interesting little book by Mr. Henry P. Bowie, which tells you all about the different strokes employed by the Chinese and Japanese painters; but whereas you can paint anyhow without being found out except by experts, almost anybody can see bad stitching. Consequently, granting their comparative lowliness in the scale of expression, the arts of the loom and the needle have remained purer than most others.

The bearing is, that what is true of them ought to be true of all the other arts, including what are called the fine arts; and it is because the procedure of needlework is obvious that it makes a good object-lesson in artistic education. It may sound extravagant, but I believe that our arts will be regenerated from below; that real appreciation of painting will begin when everybody understands that granting its fuller and subtler capacity for expression, exactly the same rules apply to painting as to needlework. The question of representation has nothing to do with the use or abuse of materials. The Bayeux Tapestry is pictorial in every detail, but it is all done in terms of needlework. Nobody boggles at the stitches in a piece of embroidery, or asks why lace flowers are conventional; and once it is recognised that painting is designing in paint all difficulties about degrees of "likeness" to Nature disappear.

This would seem like going beyond the subject of handicrafts into that of the fine arts if it were not that the future of both depends on abolishing the false distinction between them. The only true distinctions in the arts are based on the materials used in them; and a man is a painter or a carver whether he paints furniture or pictures, or carves capitals or portrait busts. It is true that there is in the arts a rising scale of expression; though to go back to needlework, what could be more expressive than a piece of true "point" lace—*punto in aria*—"stitch in the air"? Nothing approaches more nearly to Flaubert's ideal work of art "about nothing without external connections held together by the internal force of its style." Or, to quote an Italian writer, "Needle lace is the classic tongue of Italy, and the

bobbin maker is its provincial dialect; clear, vivacious, emphatic, sharing the merits and defects of the populace."

The last eleven words might very well be taken to describe the characteristics of all Folk Art. There is no need to make a list of the different varieties of folk art; wood-carving, stained glass, jewellery, book-binding, and so on—but in view of the sociological importance of the subject it would be worth while considering them all from this point of view of popularity—in the better meaning of the word. Nothing is worth encouraging in art that is not true to the habits of the race. This, by the way, is particularly true of the subject of toys. Personally, I am inclined to take toys very seriously, because they are the world of the race at its most impressible age. Anybody who has had much to do with children knows that what may be called folk toys are the only toys that please in the long run; and if you consider them carefully, you will find that not only are they very true to their materials—the wooden horse, very wooden, the rag doll very raggy, and the woolly dog very woolly—but that they renounce all minor accidents of "likeness" in favour of a boldly synthetic treatment of natural forms. This is immensely significant. The reason why the child prefers the home-made doll is not that it is home-made—for children are not sentimental—but that with all its defects it is on the whole a more effective summary of the human form than the shop article. Fundamental instincts batten upon fundamental character and let refinements go hang—and there is one of the secrets of art. This truth should be borne in mind in designing and making toys, particularly now that disabled soldiers and sailors are being turned to the work.

If Folk Art be not the only real art there is, it is, at any rate, the best field for the discovery of artistic principles; because in it you are close up against the two main factors in any form of art! the stuff and the people.

Northamptonshire Lace

BREECHES-MAKERS for 96 years.

The breeches we make are deservedly noted for their excellence of material and fine workmanship. Fit and lasting wear we assure, and in addition that justly valued attribute—"character."

Our experience in breeches-making is certainly adequate beyond question, for it dates from 1821—ninety-six years ago.

For inspection, and to enable us to meet immediate requirements, we keep on hand a number of pairs of officers' breeches, or we can cut and try a pair on the same day, and complete the next day, if urgently wanted.

Patterns and Form for self-measurement, at request.

THE ORIGINAL CORDING'S, ESTD. 1839.

Campaigning Waterproof Knee Boots.

"Your 'Newmarket' Boots are just splendid I wore them in the trenches in water for two days and nights, and on a long march from 9 p.m. to 3.30 a.m., and my feet were perfectly dry and warm. For marching they are most comfortable." (Extract from an Officer's letter.)

Our "Newmarket" boots are "just splendid," because the material is so good and the workmanship unusually skilful and thorough.

The legs are made of a tough-wearing tan twill, interlined with a stout layer of pure rubber, and it is to be noted that the "life" of such boots depends principally on the quality and substance of this *hidden* interlining. Special tan leather covers the foot-part, and only seasoned first-grade sole leather is used.

The fitness of these boots for military wear has been fully proved by a large number of officers, many of whom formerly used them for fishing and shooting.

The demand at one time was greater than we could meet, but we now have all sizes in stock, or we can make specially in exceptional cases.

To order, please state size of boot worn, or give pencilled outline of foot in sock, or better, send an old boot, and if first transaction, add remittance (85/- is the price) which will be returned at once if the boots are not approved, or give business reference and home address.

At request, ILLUSTRATED LIST of Waterproof Coats, Boots, Portable Baths, Air Beds

CANADA'S CRISIS

CANADA is facing the most vital crisis in her history. The Conscription controversy has fanned into a blaze the long smouldering antagonism between the Imperialist and the Anti-British sections of the Dominion. Englishmen who are not familiar with the opposing elements which comprise the population of Canada, or with the political situation which has grown up as a natural consequence have difficulty in appreciating the bitterness of the present electoral contest. It is still harder for them to realise the far-reaching results which may arise if Sir Robert Borden's Union Government is defeated at the polls.

Broadly speaking, the people of Canada may be divided into three great sectors. First, those of British birth and descent who believe in British institutions and ideals, and look upon Canada's tie with the Motherland as a sacred possession. It is this sector which has, in the main, supplied the men who have fought so well and died so gloriously upon the fields of France and Flanders. Secondly the French-Canadian population, descendants of the original European settlers of Canada. At one time the French Canadians dwelt almost entirely in the Province of Quebec, but during recent years they have migrated to Ontario and the West so that their influence is felt in many parts of the Dominion beyond their native province. As a whole, the French Canadian has sympathy with neither France nor Britain. Nor has he any real understanding of, nor liking for, his English-speaking fellow-citizen. So far as Canada is concerned, his national aspiration may be summed up in a phrase: "French Canada over all." The third element in Canadian life is the Alien; the foreigners who, attracted by the boundless resources of the Dominion have entered in great numbers, and are especially strong in Western Canada. This alien population includes many of enemy origin as well as a formidable host from Scandinavia, Holland, Russia, etc. This element may be considered as opponents of Conscription, or of any other measure tending to enable Canada to exert all her powers towards winning the war.

The Union Government was formed by Sir Robert Borden, the Conservative Prime Minister, with a view to uniting Canada for war purposes. It is responsible for the Conscription Act which has given rise to the present general election. It is composed of the English-speaking leaders of both parties with a small representation from French Canada, the latter condition being due to the fact that Sir Wilfrid Laurier and his principal French-speaking supporters refused to join it. But the Union Government has the support of all Canadians who are loyal to the British connection, and who desire that Canada should faithfully discharge her duty in the war. It is opposed by practically the whole of the French Canadian population, and it is doubtful if Sir Robert Borden will carry five out of the sixty-five seats in the province of Quebec. It

is also opposed by the alien element, and by that inevitable percentage of "slackers" which exists in every country and which does its utmost to evade service. Also by a few who place party loyalty above patriotism.

The Opposition is led by Sir Wilfrid Laurier with M. Bourassa and M. Lavergne as chief lieutenants. Englishmen who have read the eloquent speeches which, from time to time, Sir Wilfrid Laurier has uttered in the past may be surprised to learn that he is now the chosen leader of anti-British agitation in the Dominion. Canadians who have followed Sir Wilfrid Laurier's career, are not surprised. He has only recently dropped the mask of Imperialism, but throughout the whole of his Premiership the undercurrent of his policy tended to draw Canada away from the Motherland. When the South African war broke out Sir Wilfrid, it is recalled, opposed the sending of a Canadian Contingent. Then realising that British Canada would not be denied the privilege of sharing some of the burden, he quickly yielded. But he showed little sympathy towards the expedition. During the unpleasant dispute which led to the retirement of Lord Dundonald from the command of the Canadian Militia, Sir Wilfrid Laurier, amid the cheers of his French Canadian followers, described the British general as a "foreigner." At the polls during the election following on the "Reciprocity with the United States" campaign the Canadian people repudiated the suggestion that Canada's allegiance was for sale, and drove Sir Wilfrid Laurier from power. During this campaign Sir Wilfrid made a typical utterance to an American audience. "The ties," he said, "which exist between Canada and the British Empire are slowly, but surely, being severed."

Behind Sir Wilfrid Laurier stand the sinister figures of his two foremost supporters—the two men whose names, to British Canadians, are synonymous with treason, rebellion and reaction—MM. Bourassa and Lavergne. Throughout their public lives both have been bitter and persistent enemies of everything British. They are the acknowledged and admired leaders of the French-Canadian Nationalists, who desire that the French population shall maintain a separate entity in Canada, viewing all national questions solely from the standpoint of French Canadian advantage, holding the balance of power, having its own language, its own laws and customs and special privileges. If this aspiration were fulfilled all hope of national unity in Canada would be at an end. It is interesting to note that the alliance between Sir Wilfrid Laurier and MM. Bourassa and Lavergne is of recent origin. While nominally following Sir Wilfrid's leadership, the two French Nationalist chiefs have, until the war, played their own hand. It was an open secret that at one time Sir Wilfrid Laurier viewed their activities with suspicion and even alarm. Now if the forces of reaction win, it will be his two wayward followers who will place the sceptre of power in the hands of Sir Wilfrid.

The voting strength of British Canada has been weakened by the war. Many Canadians have died for the Empire. Many men of influence and energy are fighting the enemy at the front, and cannot help against the enemy at home. The forces of reaction are at their strongest. By playing upon prejudices and jealousies, by wide promises, by strenuous anti-British propaganda, the Opposition seeks to make more inroads upon the supporters of the Union Government. French Canadian Nationalists realize that the circumstances of war have given them an unequalled opportunity to grasp heretofore unobtainable power. If they win the election, Canada is theirs—for a time at any rate. And they hope to entrench themselves so firmly that the dream of French Canadians being the dominant people of the Dominion may become a reality, so strongly established that even the return of the British Canadians, now abroad, would be unable to shatter it.

It is a hard hour for Canada, and for all who are loyal to her and to the Empire to which she belongs. But upon lesser occasions she has defeated reaction. Her sons who are overseas believe that she will rise to this greater occasion. If, however, the anti-British element should triumph at the polls, be assured that the battle is only beginning, for the Blood Loyal will know how to reckon with those who sold Canada in the hour of the Empire's peril.

The Battle of Cambrai

By Hilaire Belloc

THE enemy is making for the recovery of a firm line in front of Cambrai such an effort as he has not made in the West since Verdun, and as he has never yet made in the winter at all. That is the only great matter of the war at this moment. To it may be added at any hour news of that main bombardment upon the Piave front, which has been so long expected and so long delayed, and in the absence of which nothing can be predicated of the Italian situation—for it will be the test of the Piave line, and what has happened there hitherto on that line is no sufficient index of what may come. But at the moment of writing the battle for Cambrai must occupy all our attention.

Quite a short time ago the successful surprise effected by the Third Army would have compelled a modification of the whole German line. Though there was no complete rupture of the defensive system, though Cambrai itself was not reached and though a considerable power of reaction was shown before the end of the second day, yet General Byng's advance, the profound wedge which he pushed into the centre of the enemy's system, his turning of the Quéant-Drocourt line, and on top of this the occupation of Bourlon Hill, meant the elimination for the moment of Cambrai as a nodal point of communications. The main railway running north to Lille could not be used, and if the salient were held the heavy pieces soon to come up would render not only the main railway but every road and line of metals converging upon Cambrai unuseable in the neighbourhood of the town, and therefore missing their connections.

I say that under such circumstances the enemy, were he still in the position which he was in before the International Anarchists in Russia betrayed the Allied cause, would have been compelled to fall back. He would have had to go back to what is roughly the frontier line of Valenciennes, and we should now be watching the problems set him in attempting

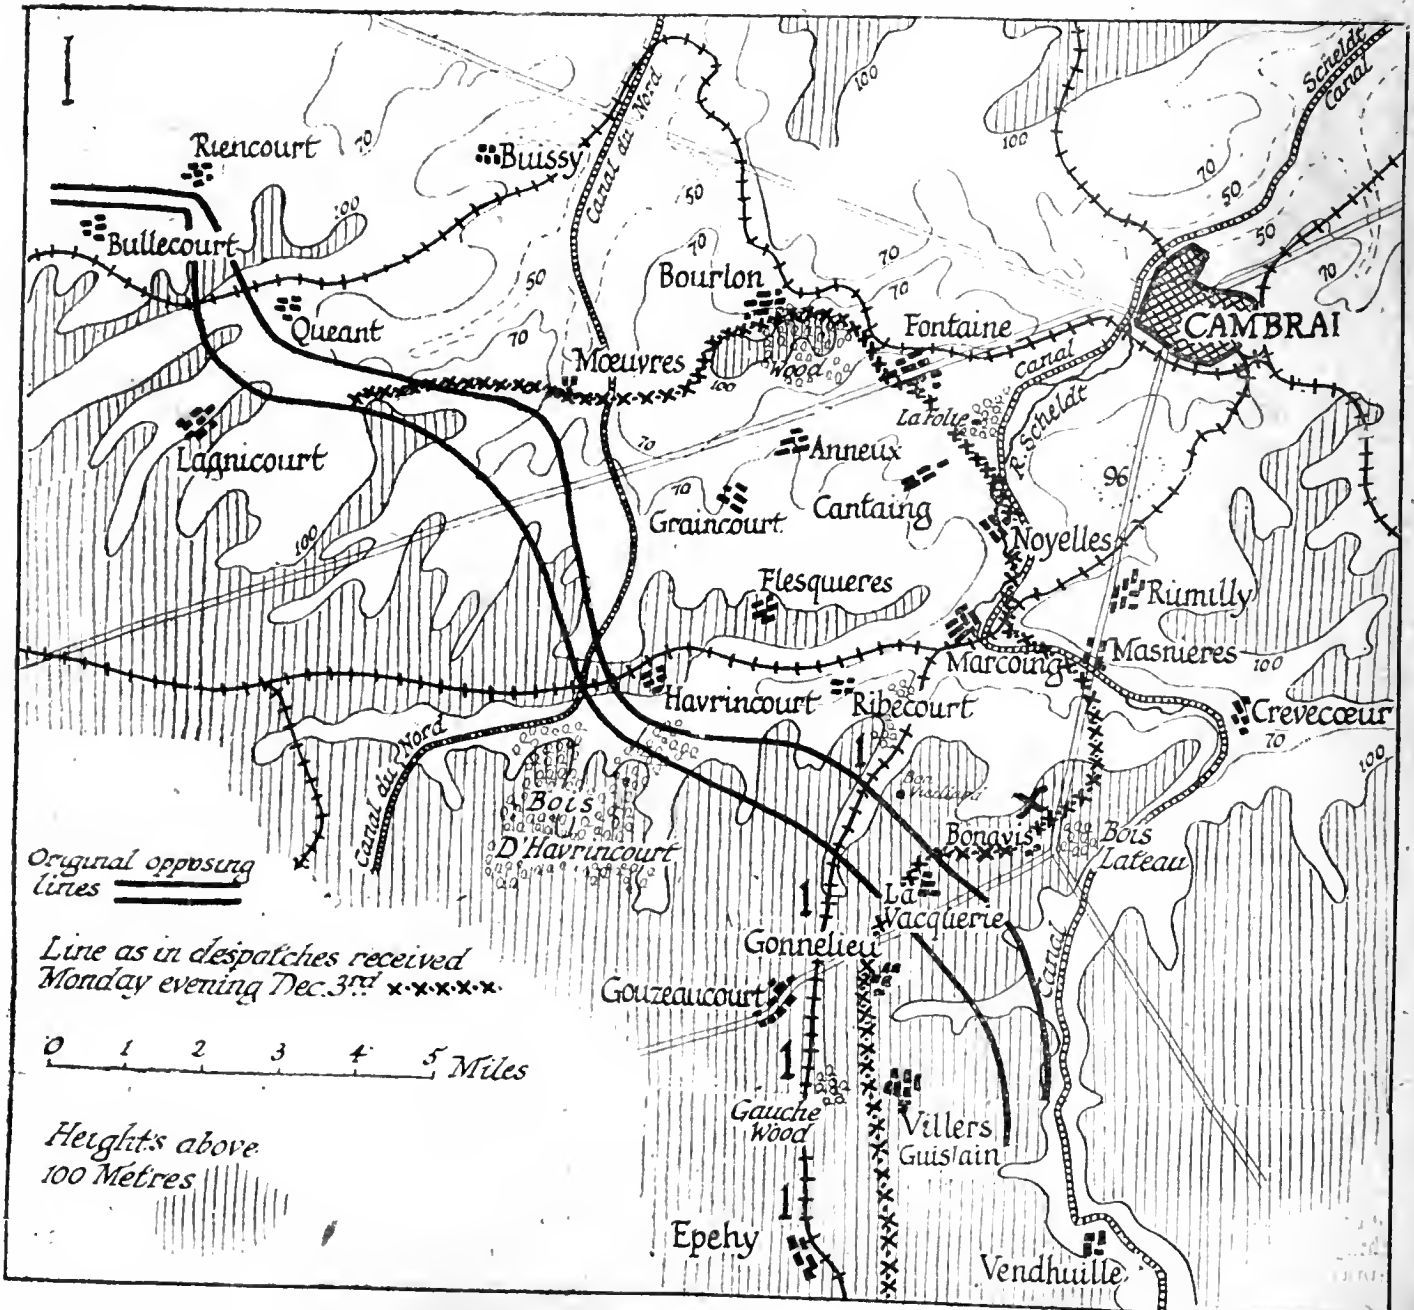

to retire without rupture. His only alternative to such a policy, once the nodal point of the Cambrai region was dominated by British fire, was to attempt to drive the British back and to make them lose the vantage they had attained. But to do that with no serious opportunities for surprise, and on ground where conditions of partially open fighting had been restored meant the sacrifice of very large numbers of men. Those large numbers of men a few months ago he could not have afforded. To-day he can. To-day it is worth his while to pay a high price on the chance of recovering the salient or, at any rate, flattening it sufficiently to restore Cambrai to something of its old value as a centre of communication. He has gone in for the alternative policy quite thoroughly, and has poured in as great masses of men as the front can possibly hold, and is continuing to pour them in.

The diary of the battle up to the moment of writing is somewhat as follows:

On Tuesday, November 27th, the strong but still local counter-attacks of the enemy were continuing, and were directed upon the height of Bourlon Wood. They were not of a force which could shake the British hold upon the height or even upon its neighbourhood. There was even a certain British advance on that day near Fontaine and the capture of 500 enemy prisoners. And the two villages, Bourlon and Fontaine, seem to have changed hands twice in a day of confused fighting.

On Wednesday last, November 28th, there was an interruption or lull in the enemy's movements, and the main part of the fighting was confined to an artillery duel, while on the next day, Thursday, this state of affairs continued.

At that moment, the night of Thursday, November 29th one may fix the end of the second phase of the Battle of Cambrai. The first phase had been the two days of successful advance, followed by the capture of Bourlon Hill, a story

which is now so familiar to all of us. The second phase has been that of considerable, but localised, enemy counter-attacks, organised with the special object of recapturing Boursion Hill, in which object they failed. But all during this second phase, which had lasted the better part of a week, and which ended in two days of lull, the main concentration was going on for the third and very serious phase opened on Friday last, November 30th.

It was just after day-break of Friday last, November 30th, that a vast counter-attack on a scale altogether different from those which had preceded it was launched.

The enemy advanced at 8 o'clock from Vendhuile to Creve-cœur on the southern limb of the salient. He was rapidly obtaining on this line a success which threatened to develop in a very disquieting fashion when, in the calculation that the British would already have withdrawn men from the north to meet this southern pressure, he further launched exactly two hours after, a correspondingly heavy blow against the northern limb. This Friday was not only the first but also the critical day of the whole operation. The enemy was throwing in men upon such a scale as had not even been seen at Verdun, for I think there was no one day at Verdun when a concentration of ten divisions was being used at once. The first two hours of the southern attack were a continued story of success for the enemy. He went on his extreme right down the Scheldt Valley, and got behind Masnieres. He carried the high point of Lateau Wood, where the fork of the main roads is, and went on beyond that to La Vacquerie. He rushed Gonnelleu and to the left Gauche Wood. At about ten o'clock some of his men had got into and beyond Gouzeaucourt. Meanwhile, the attack from the north aimed at crossing the high road south of Mœuvres joining hands with the southern attack somewhere by Havrincourt Wood and so cutting off all the British in the salient.

By 10 a.m. it was half done. The enemy had got well through the old entrenched line which had been held for months before the last advance. Gouzeaucourt was nearly two miles behind it. And he was then well past Gouzeaucourt to the west, while the great southern attack drawn from Mœuvres towards Havrincourt was in full progress. The position was clearly exceedingly serious. But it was partially restored almost immediately. Before noon the southern attack was checked, and the enemy spent the mid-day in trying vainly to entrench himself upon this new line. The early afternoon saw the British counter-attack in this region. Gouzeaucourt was recovered, so was Gauche Wood, and at the end of the day he stood here on the line Gonnelleu and Villers Guislain. He was no longer astride of the railway (1) (1). (Not in use, of course, but a convenient mark for following the line here). To the north he retained his hold upon the fork of the roads at Lateau Wood and the high point at X, which dominates all the valley to the north, and the outskirts of the ruins of La Vacquerie hamlet. But he was beaten back out of the southern suburbs of Masnieres, and the British still held the crossing of the Scheldt at that point. If this crossing could have been maintained it would have been a matter of some importance, for though the hill beyond Rumilly (Hill 96) hides Cambrai, dominates the valley

below and has been constantly in German hands, yet the bridgehead at Masnieres was an opportunity for further advance whenever this might be possible. It overcame the obstacle of the canal and of the stream of the Scheldt by its side.

With this situation on the southern limb clearly in mind, let us turn to what was going on on the northern. Here the attack was timed to coincide with the southern success. It counted half the forces engaged, five whole divisions, and of these three, the main weight of the hammer, were crowded on to the extraordinary narrow front of 5,000 yards between Boursion and Mœuvres—a whole division to less than each mile; and such a weight of men came on in waves all day to push through and join hands with their comrades to the south. They failed.

The storm did not abate until darkness set in. At its height the most advanced bodies of the assault seem to have reached as far as the main road, but they never held any point beyond.

The enemy issued a claim at the end of the day to some 4,000 prisoners and 60 guns. The summary of his whole effort was that he had carried a belt about 2,000 yards which, on the southern limb, gravely threatened the railway supplying the salient on this side, and, most important of all, perhaps, firmly seized upon the height of Lateau Wood which dominates all the valley to the east and north. This occupation compelled the British to evacuate the important bridgehead of Masnieres in a little more than 24 hours. A corresponding success on the north would have given him a great victory. Luckily no such advantage was gained. On the north he obtained nothing but small indentations of the line between Boursion Hill and Mœuvres, lost very heavily indeed in men, failed in his main object, which was the cutting off of the salient and failed also to carry Boursion Hill. A subsidiary but important point: For, so long as Boursion Hill is in British possession, the communications of Cambrai are out of use.

During Saturday the pressure was relieved save in the neighbourhood of Masnieres, the suburbs of which village were again entered by the enemy before the retirement was ordered from that place. There was also detached fighting near La Vacquerie and Boursion, but the battle as a whole marked time. But Sunday saw the renewal of it in its fullest activity. The enemy attacked with especial strength again on the south; the line was maintained everywhere against him except at La Vacquerie and just east of Marcoing; south of the latter little town the enemy broke through at one point, but only for a moment. And at this point, with the result not decided, our information ceases. The enemy's last claim was to 6,000 prisoners and 100 guns, the latter item including, of course, whatever shattered pieces he found on whatever part of his advance, and further including pieces recovered by the British in their counter-attacks.

It is, unfortunately, impossible to draw any conclusion in this stage of the action. All we see is the failure of the enemy to fight an encircling battle capturing the British in the Cambrai salient, and his present determination at least to drive the British out of that salient in the battle which is still continuing.

Soldiers v. Critics

There are certain first principles, running all through military history which it is the business of soldiers to study, and which soldiers do study and practice. It is the business, also, and in part the recreation of mere students to master these elementary principles, for if they did not they could not follow military history and understand it, either in the past or in the present. Those principles are simple enough. It is their execution in detail and in practice which is difficult. And the man of genius in this, as in every other branch of human effort, is not the man who sees obvious things, still less the man who contrives ingenious ones. It is the man who combines the power to make a good plan rapidly with the power to execute it *in the material with which he has to deal*. It is all summed up in Napoleon's maxim that any fool can draw up a strategical plan, and that the test of military power is in its execution.

There has been quite recently in the Press and on the platform, a perfect orgy of amateur advice upon the war, which had for its main character—almost for its only character—a perfectly amazing ignorance of these elementary principles. I have the right to use the word "amazing" in the first month of the war. There are, by this time, without exaggeration, tens of thousands of men who have been taught such elementary things since 1914, and if we count those who have instinctively appreciated them through taking part in war, even though they

have had no special instruction in such principles, there are millions.

These thousands and these millions are in uniform, and neither speak nor write. It would do no harm if a few of them were spared to give some simple lectures to the comparatively small number of civilians who pretend to set the soldiers right in their own trade. There is hardly anyone upon service, for example, who does not know at least what is meant by *supply*; and yet our amateur strategists leave out that factor in strategy as airily as though movement upon the globe were like the moving of a pencil upon the map.

By way of a counter-offensive against this deluge, which always comes after an unexpected reverse, and which was let loose by certain journalists and politicians, during what may be called "the Italian fortnight," a few weighty and sober articles have appeared, most of them from the pens of soldiers and none of them better worth reading than those which were printed in the *Morning Post* in succession a little time ago. Their example will, I hope, prove a sufficient excuse if I recapitulate here certain elementary points common to the whole of military history. Their appreciation can only have a negative effect upon civilians. But it seems from a recent experience that such a negative effect would be still worth attaining.

The first leading principle is this. No one can judge of a

military situation unless he is possessed of four kinds of knowledge relating to it:

- (a) *The nature of the ground.*
- (b) *The numerical disposition of his own and the enemy's forces.*
- (c) *The conditions of supply for his own and the enemy's forces.*
- (d) *The moral of his own and the enemy's forces.*

Now "ground" does not only mean a knowledge of the map—and yet a knowledge of the map, even in its largest lines is not a thing which most people easily acquire—it means also an appreciation of the state of the soil in various weathers; a good guess at the rate at which it will dry; of the effect snow will have upon it; of what will happen to watercourses after a thaw or exceptional rain; and, in general, a whole volume of knowledge which men concentrated upon their profession can, when they are exceptional men, acquire with a certain degree of rapidity, but which most men do not attempt to acquire; and which most men, if they tried to acquire it, would fail to acquire.

Of all men in all professions there are perhaps two kinds least fitted to compete in such knowledge; the first is the man who has lived by limelight and intrigue, and the second is the man who has lived by making sensations. Such careers, beyond all others, dissipate the power for concentrated, solid and, above all, rapid brain work; and those who are corrupted by such careers are the least capable of criticising soldiers. If we ask ourselves why, being the least fitted to interfere with military things, they are none the less the first to do so, the answer is that such interference lends itself particularly to public show and to sensation and to intrigue against individuals. Of intellectual basis it has none.

Erratic Criticism

If it is difficult to master ground, it is in a sense, even more difficult to master numbers and disposition. The politician may be told in the way of business, the journalist may be told by an indiscretion, the numbers and the order of forces upon either side in any part of the field. That either will remember these under the strain of public advertisement, and forced excitement is doubtful, but at any rate, that kind of knowledge is at least available. When it comes to the meaning of such numbers and of such dispositions neither of these two kinds of critics has any standing whatsoever. Why, it is the test of excellence in a commander that he should be able to read even partially the riddle presented by concentration and dispersion of forces. If he has an excellent Chief of Staff, and therefore an excellent Bureau piecing together intelligence and reporting accurately what there is in front of him and how it changes—even so he has to interpret the will that is behind such grouping, what part of it may be intended to deceive, what part may be used, and why. The greatest masters of war have, if you will read their memoirs, particularly remembered what they did not grasp in the enemy's plan. That is their interest in the whole affair. They know that there will always be a very large margin of error; their interest is to see how far it can be reduced. But your unmilitary critic works on quite another principle. He always knows—*after the event*—what the enemy was intending, and why such and such a concentration was made in one place, and such and such a withdrawal of forces from another; how this disposition would be used, and with what effect. He always knows, I say, after the event, what these things mean, but he will also, unfortunately, presume to know beforehand what should be done, although he eliminates in this forecast any knowledge of the enemy's dispositions or of the counter-dispositions on our own side.

In the matter of supply the contrast is more striking still. Supply is the great material preoccupation of all commanders. It is the one great material factor which governs everything. A man can rest upon his oars and forget movement for many days at a time; he can forget for some hours disposition and ground; but supply occupies his thought in every waking moment of the day; it conditions everything. That is what supply is to the soldier. The other person, who wants to tell the soldier what to do, has a very simple way of treating supply—he leaves it out altogether. He will propose the reinforcement of the Russian front with two million Americans, or the moving in a day or two of a score of divisions over 700 or 800 miles of railway. He vaguely thinks of the rolling stock as infinite; he vaguely attaches the same miraculous quality to the condition of rails, the number of sidings, or of tracks, the stores of coal and of petrol, spare parts, repair shops, and the hundred other things of which he has not so much as heard.

Lastly, in the fourth element, that of moral, you have yet another kind of disaster. The soldier judges it with difficulty and as a highly complex, sometimes slightly changing,

sometimes rapidly changing thing, peculiarly difficult to estimate in the enemy's case; difficult enough to estimate in his own, needing daily observation and care, daily reinforcement, correction and change. It is for the soldier a large complex field of many factors, upon the whole stable, but only stable because every point is carefully watched and supported.

For the critic of the soldier it is something quite different. He does not leave out moral, but he simplifies it in a childish fashion, and, true to the traditions of sensation and advertisement, he exaggerates it wildly. He is the recipient of all the silliest rumours, of all the wildest descriptions whether of panic upon one's own side, or of despair upon the enemy's. It is from him we get all the stories of exaggerated intrigue. If the civilian interfering with soldiers is negatively and relatively dangerous in the other three parts of knowledge, he is here actively and positively dangerous. He spreads panic or false report about the enemy in a fashion which soldiers punish sometimes with death, but which the civilian busybody indulges in as though it were a normal excitement.

The Second Principle

The second leading principle is this! That military operations require for their success *competent* unity of command.

The word "competent" in this definition is essential. The words "unity of command" does not necessarily signify a mechanical unity; it signifies a unity of intention and plan.

When the outsider interferes with military affairs under the plea of producing unity of command he breaks this canon in two ways. First of all the unity which he proposes being derived from himself, is not competent. He is not competent to judge a military situation or to decide upon it.

Secondly, by his very action he disturbs, modifies, and may disintegrate that very unity of command of which he speaks.

Unity of command does not necessarily mean the directing of all military operations, in no matter what field (so long as they are contemporary), by one brain. That is, indeed, an ideal state of things which, when it can be accomplished; leads to prodigious results, first of success, and soon afterwards, in most cases, of disaster. For this ideal with its fruit of immediate success, often followed by corresponding disaster (because authority has to be too distantly delegated, and the field becomes too great for one man—Napoleon is the leading example) is not the essential test of unity of command. That test is to be discovered in co-ordination of operation, and particularly is this true of an alliance.

It is even true of separate operations, conducted by one power: for instance, the separate operations conducted by the generals of the French Republic in 1796, or the separate successful operations conducted by the Roman State at the end of the Second Punic War. But in the case of a true alliance, that is, of an alliance between Powers more or less equal, an essential unity of command is not obtained as a rule by subordination to one head. It is attained more easily, and certainly as history goes more successfully, by agreed balance between two or three men each responsible for his national army. An alliance is, of its nature, weaker in the matter of unity than a single Power or than a single Power controlling subject vassals. But granted that inevitable condition, the essential quality of unity of command is discovered in its best by co-ordination.

When the operations of an army are successful, no one doubts this, and if we consider the classic instances of a true alliance succeeding in the field, we shall find that it is usually conducted after this fashion. You have in our own military history alone the examples of Eugene and Marlborough, and the still more striking instance of Wellington and Blücher. There was plenty of the friction inevitable from double command, but although the operations of the Waterloo campaign were all within one narrow field, dual command was maintained. Had the campaign failed, we should have heard for a hundred years that the cause of its failure was this dual command—although that dual command was inevitable. As a fact, it succeeded, and no one remembers the disability under which it suffered. It was not Wellington who ordered the retreat after Ligny. Wellington had doubted the value of the Ligny position; Wellington grumbled badly about the delay of his ally on the critical afternoon of the 18th. The Prussians, I fancy, might equally have complained that they were the first to meet and to understand the moment of the invasion. But the thing to remember is that the alliance succeeded. That alliance would have failed had it been possible for a third civilian party to intervene, discuss, modify, or even disturb the action of the two generals.

The Third Principle

There is a third principle attaching to all military operations equally repugnant to a certain type of politician and journalist,

and with that I will conclude. This principle is the principle of secrecy, secrecy for the common good and with a military object. It makes the accounts of operations dull; it prevents the speaker or the writer from getting his "effect"; it badly dims the limelight. Nevertheless, it is essential. The difference between success and failure, other things being equal, is the difference between your knowing more of the enemy than he knows of you, or the contrary.

It shows a strange lack of intelligence that men should complain of such a necessity even in detail. It should surely be evident that the smallest and apparently most insignificant detail may be just what the enemy's Intelligence Department requires in order to piece together evidence hitherto undecipherable.

We have just had in the field one of the very best examples—I think the best in the whole war—of what surprise can effect. We owe it entirely to the soldiers. One piece of vain talk

by a politician, one uncensored line in an article pretending to prophesy, and the victory in front of Cambrai would have been ruined. It all pivoted upon the element of surprise.

Whether it be possible to enforce those three principles—the incompetence of non-military advisers; the necessity for maintaining the integrity of command, and the necessity for secrecy upon men whose whole mode of life is the antithesis of the soldier, it would be difficult to say. But if the public will appreciate the importance of those things, then general opinion will have some remaining force and perhaps render the recent follies, of which we are all so ashamed, less frequent.

H. BELLOC

Mr. Belloc, who has recently returned from France, will write a special article on the American Effort next week.

Rhodes' Imperial Dream

By Lewis R. Freeman

The death of Sir Starr Jameson and the concluded campaign in German East Africa makes this comprehensive review of Central African railway construction very apropos.

Dreamer devout, by vision led
Beyond our guess or reach,
The travail of his spirit bred
Cities in place of speech.
So huge the all-mastering thought that drove—
So brief the time allowed—
Nations, not words, he linked to prove
His faith before the crowd.

HOW well these lines of Kipling epitomise the character of the men who strove so hard to teach the British Empire to "think imperially" it has taken the present war to bring home to the people of that Empire. "So much to do, so little done," were the dying words of a dreamer passing with his dream but partly fulfilled; for the uniting of the South African states, and the making that union an integral part of the British Empire was only the first step towards the ultimate bringing of the whole of East and Central Africa—from the Mediterranean to the Cape of Good Hope—under the British flag, and binding the several regions together with bands of steel by building a railway which should run from the mouth of the Nile to the Indian Ocean, on a "Red" map all the way.

Fate was never more capricious than in the irony of her decree that it should be the very thing—the ruthlessness of Teutonic territorial ambitions—which appeared to Rhodes to make the fulfilment of his dream impossible, which has ultimately operated to bring that splendid conception within the range of imminent possibility. The way will be open for the ringing up of the curtain on the second and greater tableau of Rhodes' "Imperial Vision" when the campaign in what was once German East Africa is finally finished.

When Rhodes first "dreamed his dream" of the "Cape-to-Cairo" railway probably nobody knows, but it well may have been on the occasion of his first visit to the Victoria Falls of the Zambesi, some time in the eighties, when it is known that his mind was already busy with his "Union of South Africa" scheme. A friend of mine—a prominent American mining engineer who has spent many years in South Africa and been much in the company of Rhodes—related to me, on the occasion of my last visit to Johannesburg, an illuminative and prophetic incident in connection with the great man's first sight of Victoria Falls. He prefaced his account by mentioning that the natives of this region have long had a belief that in the heart of the great rainbow, which is formed by the drifting mist of "The Smoking Waters," may be seen visions of the future. The tribal witch-doctors, he said, went there to learn the issue of impending battles, and even the brave Scotch missionary and explorer, David Livingstone, professed to have seen faking shape in the iridescent mists a vision of a white man carrying a lamp in the darkness—the Church bringing the Light of Faith to the tribes of Africa, according to his interpretation.

"We had trekked across to the Falls from Bulawayo," my friend went on, "principally with the idea of getting a line of the territory which was shortly to be named Rhodesia. It was the first time that all but one or two in the party had seen the great cataract, and for several days we had been in camp there, literally lost in the wonder of the most stupendous natural spectacle ever given to the eye of man to behold.

"Rhodes, his mental activity seemingly stimulated by the play of the primal forces, lived like a man in a dream, his

mind evidently engrossed with his colossal schemes of Empire. His total obliviousness to all that was going on about him while thus wrapped in thought had already resulted in his being lost on several occasions, and it was on this Victoria Falls trip that those of us nearest him formed the plan—afterwards followed through all of his treks about the veldt—of never allowing him to wander beyond the sight of at least one armed white man.

"This was how it chanced that, on the day I have in mind, I tailed on behind Rhodes when, just before sunset, he strolled absently away in the direction of the Falls. He walked aimlessly for a while, with hands clasped behind him and head bent in thought—a characteristic attitude—but at the first touch of spray from the wind-blown drift of the 'Smoking Waters' he seemed to shake off his lethargy, and started at a quicker pace along the path which led through the 'Rain Forest' to the cliff above the 'Boiling Pot.'

"Soon we were drenched to the skin (it is now the custom to wear waterproofs in the passage of the 'Rain Forest'), and as the sun-shot mist grew thicker little rainbows began forming about the birds and swaying trees and all moving objects and I saw Rhodes and his Kaffir boy walking, like saints of old, with shining halos about their heads.

"Onto the very verge Rhodes pressed, while I hastened to push up abreast of him lest he should fail to discern that the cliff rim was the dead-line between vision and reality and step off into the mist-choked gorge. He started at the touch of my hand on his arm, but—except for the fact that he was shouting above the deafening thunder of the waters—his manner was almost matter of fact as he roared: 'Thanks, S—. Glad you came. Worth getting soaked for?'

"Then, as his eyes wandered back to the sheer 400-foot drop of the 'Leaping-Water Fall,' the far-away look that I knew so well returned, and he was off again with his dreams. Yet it was not to the white brocade of the face of the fall that he was looking, nor yet (where my own eyes were irresistibly drawn) into the boiling depths beneath, but straight across to the opposite cliff, where the largest and last of a long arch of a dozen or more rainbows spanned the gorge in vivid mother-of-pearl.

"S—," he thundered (he spoke without lowering his eyes, and I caught the words only by bringing an ear close to his lips and putting a hand over the other to shut out the roar of the Falls), 'Do you know that the Kaffirs claim that they can see far into the future by looking into the depths of that big rainbow? No? Well, they do.'

"And what do you think I can see there at this very moment? Two lines of shining steel—a railway—running from one end of Africa to the other, and crossing this gorge right over there where the spray from the Falls will beat upon the faces of the passengers, just as it beats upon ours.

"To east and west I can see branches running—maybe a dozen; maybe a score—picking up business for the main trunk all the way from Cape Town to Alexandria. And look, S—, do you see that bar of red?' (Through the rainbow glowed a segment of dusky rose, where the light of the setting sun struck through the smoke of smouldering veldt fires). 'That means that it's going to be an "All Red" railway; that it will run in British territory all the way!'

"The piercing eyes under the beetling brows were shining as we turned to go, and I knew that tears of enthusiasm were mingling with the clinging mist of the 'Smoking Waters.'"

* * * * *

That the railway Rhodes dreamed of was to be an "All British" route undoubtedly weighed more heavily with him

than the fact that it was to be the first through trunk line to traverse one of the great continents from end to end; and perhaps the bitterest disappointment he ever knew was when his country, in 1889, acquiesced in Germany's entering into the possession of the region between British East Africa and Rhodesia, and at a single stroke, creating an apparently insurmountable barrier many hundreds of miles wide, athwart the route he had decided that his railway should follow. Whether, in the clearness of his vision, he realised even then—a decade or two before the ominous truth began to sink home to even the most far-seeing of his countrymen—the sinister import of Germany's designs I have never heard. He never did give up working for the consummation of what he was firmly convinced was the *sine qua non* to the success of his great plan, and at the time of his death it is said he had negotiations pending with the Kaiser by which some sort of a British zone—across the west end of German East Africa—could be purchased or leased. If it is true that Rhodes was really willing to build his railway over so precarious a right-of-way, it is all the evidence we need to be reasonably certain that even his eagle-eye had not pierced to the cloven hoof beneath the German jack-boot.

Rhodes was too much of a man of action to allow the question of right-of-way through a region which, at best, could not be entered by rails for many years to hold up the whole project. The thing to do was to get construction under way; the matter of route could, he hoped, be arranged later. His plan was to utilise the 2,000 miles of lake-way and river-way which occur almost exactly upon a straight line drawn between the two termini, and to build the intervening railway links, totalling 4,000 miles in length, as rapidly as the financial and physical difficulties could be overcome.

The First Railways

South African railway construction in early days was almost entirely directed toward one objective—the great mining and consuming centres in the north. First Kimberley and its diamonds, was the goal; then the Rand, with its gold. The magnet of the diamond mines had taken the railway to Kimberley in 1884 and by 1890 the gold mines of the Rand had carried it on to Johannesburg, somewhat to one side, however, of the direct Cape-to-Cairo route. The beginning of the Rhodesian railways was the tangible expression that Rhodes gave to his "All Red Route" dream. When his Chartered Company took over Rhodesia, the nearest railway was at Kimberley, 600 miles from Cape Town; and one of Rhodes' first acts was to get it extended to Vryburg, near the border of the vast region which had been made subject to his direction. From here was started the Rhodesian trunk line, which reached Bulawayo, 600 miles to the north, in 1895.

Construction on the line from Bulawayo to the Zambesi was inaugurated before the outbreak of the Boer War, but the disturbed condition of the country preceding and during that struggle made it difficult to make much headway during these years. After the restoration of peace, Rhodes, by persistence, arranged the difficulties of finance. Construction was started anew in Rhodesia, but before the railway had reached the gorge of the Zambesi, the hand that was driving it forward relaxed, and grew cold in death.

But what was in many ways the most difficult part of the undertaking—the financing of the Northern Rhodesian portion of the line—was already done. For that the enthusiasm and the indomitability of a Rhodes was imperative; the rest was a matter of time. Victoria Falls was reached in 1904, the Broken Hill mines in 1906, and in 1909 rail-head rested on the Congo Border at Bwana-M'kubwa. Here all idea of carrying the line up through German East Africa was abandoned, and the survey was carried across the Belgian Congo to Elizabethville. This latter point was reached in 1911 when it was expected that the 300 miles of comparatively easy construction between there and the southern end of Tanganyika would be finished by the end of 1915.

We have been told but little regarding railway construction in this region since the outbreak of the war, but we will probably be fairly safe in assuming that military exigency has accelerated rather than retarded work on any line or lines calculated to improve communications in the direction of German East Africa. It may well be, therefore, that the lifting of the war curtain will reveal not only the whole of the 2,600 miles between Cape Town and Tanganyika completely bridged by railway, but that a more westerly line may have been carried up through Northern Rhodesia to and across the borders of "German East" along the route Rhodes first projected for the "Cape-to-Cairo" route.

The location of the great Victoria Falls railway bridge furnished a striking example of the golden vein of sentiment which streaked the iron purposefulness of the Empire Builder. There were other points where it is said the gorge of the

Zambesi could have been crossed at less expense and in easier conformity to the limiting grades of the railway, facts which were clearly demonstrated at the outset by the engineers. But when they confronted Rhodes with the drawings and estimates, he only set his square jaw and issued a decree that the bridge was to span the gorge at "The Cliff of the Rainbow," and that no other point was to be considered.

"Nowhere else can a bridge be built within view of the Falls," he said, "and I am not going to incur the reproaches of generations yet unborn by allowing it to be run in another place. If the British can't build it, give the Americans a chance. Never mind who does it; only see that it is done!"

Although the contract for constructing the bridge was not let until a year after Rhodes' death, his wishes in the matter were scrupulously respected. There was no difficulty in finding a British concern ready to undertake the unprecedented task, which was completed in 1905. It is what engineers call a "two-hinged spandrel-braced arch," a type which, both architecturally and from the engineering standpoint, is best suited to its peculiar purpose. It is 650 feet long, and its 100 feet of height above the waters of "The Devil's Boiling Pot" makes it the loftiest bridge of its type in the world.

* * * * *

By a happy chance something like ninety per cent. of the main-line railway in the British controlled parts of North Africa is available as a section of the Cape-to-Cairo trunk railway. The Nile hardly varies a degree from the 32nd parallel in its whole course from the Victoria Nyanza to Cairo, and the fact that the narrow strip of cultivation along the Nile is about all of Egypt and Sudan worth reckoning with has been responsible for practically all of the railway line outside of the Delta being run in a north and south direction.

The first northern link of the Cape-to-Cairo railway is that formed by the main trunk of the Egyptian State lines, and the second is that of the main line of the Sudan Government Railways. The former ends just above the First Cataract, near Assuan, and the latter begins at Wady Halfa, below the Second Cataract. The intervening distance—ultimately to be bridged by rail—is a two-days' steamer voyage up the Nile. The 575 miles of line from Halfa to Khartoum—one of the wonders of the railway world—is the first extensive piece of desert construction ever attempted.

Three decades ago, when Rhodes' visioning eyes first saw in fancy two glistening bands of tie-bound steel reaching from the Cape to the Mediterranean, he was told that, even if there were no others, one insurmountable difficulty in the way of realising his dream would be found in the impossibility of maintaining a line across the drifting, waterless sands of the Sudan. For the want of such a line that other dreamer, Gordon, watched from the housetops of ringed Khartoum for the glint of sun on British bayonets that were fated to arrive too late to save him from the Mahdi's wrath. Because there was no such line the fanatical hordes of the Mahdi's successor, the Khalifa, blackened the sands of the Sudan with fire and blood through the ten awful years, while the British Lion, rallying his might in Egypt, gathered himself for a spring.

"The Khalifa cannot be destroyed without a railway," said Kitchener.

"Build it," said Cromer.

"But there is no water either above or below ground," protested the railway engineers.

"Then carry it with you," replied Cromer.

"But even if we succeed in building such a line, it will disappear under the drifting sands within a few months," said the engineers. "There is no precedent—"

"It will justify itself a dozen times over if it enables Kitchener to come to grips with the Khalifa," retorted Cromer. "Build it: And build it faster than ever a railway was built before."

And so, as there was no alternative offered, the engineers went ahead and did as those two men of iron Cromer and Kitchener decreed. Carrying their water with them as they went, even as the camel caravans had done for thousands of years before them, they laid twin lines of burning steel across the blistering sand wastes at the rate of a mile, two miles, and—once or twice—even three miles a day. It was not much of a railway to begin with, but it gave Kitchener's mixed force a very substantial lift towards the field of Omdurman. As a result of this whirlwind campaign the power of the Khalifa was destroyed, Gordon was avenged, the peace of Upper Egypt was assured, and the "one insurmountable obstacle" on the Cape-to-Cairo route was bridged for all time.

But the end of the wonders was not yet. This desert railway was not overwhelmed with sand at the end of a year (they found ways to guard against that), but it was overwhelmed with something else—almost the last thing in the world that had been expected—traffic. First came the old

caravan trade between Sudan and Egypt, and then, through the building of a branch to the Red Sea and the creation of a modern port, a new gateway between Sudan and the outer world was opened up, and traffic was still further increased. Rhodes' "Cape-to-Cairo" was beginning to realise his dream of "picking up business all the way."

The building of a great bridge across the Blue Nile at Khartoum made possible the continuation of the trunk line Capeward to Wad Medani and Sennar, from which latter point a 250-mile branch line was opened shortly before the outbreak of the war to El Obeid, the capital of the province of Kordofan. Even this latest 500 miles of line was expected, in the language of the General Manager, to "justify itself on commercial grounds independently of the very important strategic considerations which demanded its construction."

The Sudan system had just over a thousand miles of line in 1906, and nearly twice that length in 1911, while something over 200 miles a year were added from the latter date up to the beginning of the war. At that time projected extensions were to open up the country to the east of the Blue Nile by a line from Sennar to the Red Sea, link up the Takkar Delta

with a line from Port Sudan to Suakim, and push the main trunk on south toward Uganda and the beckoning finger of the "north-bound" extension of the "Cape-to-Cairo" beyond Lake Tanganyika.

The Sudanese programme called for carrying the rail-head to Gondokoro, just over the border of Uganda, as rapidly as possible. Uganda was then to take up construction, probably building the main line to Lake Albert, with a branch to the outlet of Victoria Nyanza, where connection could be established with the railway from Mombasa. The main trunk from Victoria Nyanza or Lake Albert may take any of several routes, but this will hardly be decided upon until the war, with the re-delimitation of African frontiers which must follow it, has been fought to a finish. The direct and natural route for the line is the one Rhodes originally had in mind through what was then German East Africa. It is devoutly to be wished that nothing may occur which will render it necessary to follow any other. If that hope is fulfilled one may ultimately look forward to "seeing red" from the windows of the Cape-to-Cairo express throughout the whole 6,000 miles of its run.

Auguste Rodin

By Arthur Symons

I.

I MET Auguste Rodin in Paris, 182 rue de l'Université, in May, 1892. The last time that I saw him was at a dinner given in Old Burlington Street in 1907. No one who has seen him can ever forget his singular appearance. There before me stood a giant of genius, with the timidity of the colossus: with a face in which strength struggled with passion; with veiled blue eyes that dilated like the eyes of a parrot when he spoke of anything that interested him deeply. He made few gestures; only when he sat, with his great hands folded on his knees, the gestures he made were for a purpose, never for an effect. I was struck by his quietness, his simplicity, a certain caution which comes from a suspicion that he is not being taken simply enough. When he talked of books or of his art or of nature there was always the same freshness and profundity.

It was in Meudon, in 1903, that Rodin spoke to me about Gustave Moreau. He said Moreau was a man of science, one of a generation which was taught to study art in the galleries, and not from nature. He was a great combiner. He took colour from Delacroix, his figures from the antique. He was not a genius, not a creator, not the great artist some have called him, but he belongs to the second rank. His greatest defect was that the figures which should be the principal part of the composition were uninteresting; the detail and the surroundings took up most of his interest. *Il était froid au fond*, said Rodin.

He spoke to me of Stéphane Mallarmé's conversation and his way of writing—full of foreshortening—"many people don't understand foreshortening." Certainly Mallarmé, whom I met later, used in his later work this artistic heresy. Imagine his poem written down, at least composed. With this most writers would be content, but with Mallarmé the work has only begun. He works over it, word by word, changing a word here, for its colour, which is not precisely the colour required, a word there, for the break it makes in the music. A new image occurs to him, rarer, subtler than the one he has used; the image is transferred. By the time the poem has reached, as it seems to him, a flawless unity, the steps of the progress have been only too effectually effaced; and while the poet, who has seen the unity from the beginning, still sees the relation of point to point, the reader, who comes to it only in its final stage, finds himself in a not unnatural bewilderment. Pursue this manner of writing to its ultimate development; start with an enigma, and then withdraw the key of the enigma; and you arrive, easily, at the frozen impenetrability of those latest sonnets in which the absence of all punctuation is scarcely a recognisable hindrance.

He spoke to me also of modern dress; what could be done with it? It all depends on the suggestion of the nude underneath the clothes. The beauty of woman's costume is that the woman is underneath, and lends it some of her life. It makes him sad to see old clothes hanging in shop-windows—they seem so empty of life, waiting to become alive. He spoke of the way in which the nude is suggested here, simplified by some fine sweep. He has not done it because he has been engaged in other work and so has had no time even to attempt it. It can never be as great as the nude, but the eighteenth century had shown that it can be delightful.

When I first saw him he said to me that his secret consisted

in exaggeration: that in this way he gets his effects without any of the hardness of other sculptors. As he showed me his mysterious little statue—the man kneeling so strangely in adoration before the woman in whom is imaged the sphinx and the child—he said to me: "Tell me what it means—what is your impression?"

"*Le mystère de l'amour*," I said.

I saw the *Danaïd* slightly enlarged, with its wonderful flesh, the palpitation of the very dimples. Certainly no one but Rodin has been so tender with women in his exquisite creations; none has ever caught so much of the eternal feminine as this sculptor of Hell. I saw the bust of Puvis de Chevannes, in marble, wonderfully modelled: the lines of the neck coming out like real flesh, the modelling of the ear, the lines of the face. Yet in so wonderful a poise of the head one saw the ability of the expression of nullity: the look of a man who goes through a crowd and sees nothing.

When one has realised what is called the *colouring* of his statues, in a sense like that of painting, the cunning employment of shadows, the massing, the conception that begins them, the achievement that ends them, one sees little enough of the infinite secrets of this man of genius. Let me choose, for instance, the exquisitely enlaced couple where a youth and a maiden are clasped in a virginal embrace—the shadow of the hair falling along his cheeks—with so lovely and discreet a shadow, when the lips press the hair of the maiden; her face is blotted out under his cheek: one sees it, lost in ecstasy, behind. And in these who lie in a space of small rock, one sees the exquisite purity of the flesh, the daring of the pose, foot pressed amorously on foot: the very down of the flesh.

Rodin told me that the inspiration for *La Porte de l'Enfer* came to him in 1875. When I saw it it covered the entire space of one vast wall; there was the great door, and on either side of the door climbed up and down tormented creatures, climbed and crawled and coiled: all one headlong flight and falling, in which all the agonies of a place of torment, which is Baudelaire's rather than Dante's, swarm in actual movement. *Femmes damnées* lean upward and downward out of hollow caves and mountainous crags, they cling to the edge of the world, off which their feet slip, they embrace blindly over a precipice, they roll together into bottomless pits of descent. And all this sorrowful flesh is consumed with desire, with the hurrying fever of those who have only a short time in which to enjoy the fruits of desire. Their mouths open towards one another in an endless longing, all their muscles strain violently towards the embrace. They live only with a life of desire, and that obsession has carried them beyond the wholesome beauty of nature into the violence of a perversity which is at times almost insane.

Le Penseur is seated in an air of meditation in the middle of the frieze. On one side of it a Dance of Death; a skeleton, a Menad, with lifted throats and hands; figures shameless and hilarious, dancing, lying on the ground, lifted on one another's shoulders. Some writhe in agony, move tumultuously, swarm round the Thinker. Below are larger groups. Here is one figure falling backwards—a great figure of a man—who falls right out of the composition, beyond the line of the frieze. A winged figure falls horribly; creatures creep out of holes, climb rocks, grovel, mount and descend in an agony of useless effort. A desperately faced woman flings herself on the body of her lover, as if to guard or save or help him.

Some stand, lifting desperate arms; a woman sits, doubled up on herself, the head hanging below the knees: and always there is beauty as well as terror; the lines are the lines of beauty.

In the work of what might be called (perhaps wrongly) a modern Michelangelo, one finds the anatomy at times extravagantly visible, at times forgotten in the suavity of still suffering flesh; the charm of perversity, the joy and the beauty of hell are there: and everywhere one sees marvellous effects of colour, of light and shadow: always a sense of movement. Never did any sculptor so adore woman's back and loins; and always there is simplicity in his approach to art by way of nature; even in the profile of the bones. And in these wave-like, flame-like, wind-tossed, *tourmentées* figures, one sees the sexual delight of sex and the terror of their abominable depravities.

And all this is an art of nerves, modern nerves, perverse and malign, and yet always in the classic tradition; seen always in the beauty of the lines, in the human harmonies; where the beauty in all cases comes from the colour, the modelling. Nor was there ever an art which conquered more difficulties. In the intensity of expression, in faces and forms alike, one finds the extremes of strength and of sweetness: stupendously, where one sees limbs and figures, some partly seen, legs emerging from a human crowd: the wonderful figure who leans forward, clasping the right foot before him in a nervous agony; in the lovely little group of Sirens, caught in the hollow of a wave, the wave humanised.

So, in the two qualities I have named, sweetness and strength, he is allied with Michelangelo. "For to his true admirers," wrote Pater, "there are sweetness and strength, pleasure with surprise, an energy of conception which seems at any moment about to break through all the conditions of comely grace, recovering, touch by touch, a loveliness found usually only in the simplest natural things—*ex forti dulcedo*."

Yet, in this epic in stone, stone becomes song, becomes music. And in its perfect proportions, in its harmonies, in its balance (composed of so many exquisite poems massed together) how lyric art becomes a great drama! And there is a definite reason for comparing this creation of Rodin's with both the lyrical and the dramatic arts. Did he not say to me, did he not write, of the architecture of the human body, "that it is architecture, and that architecture is comparable with it?" "Moving architecture," as he calls it in his book, "and so simple, if one possesses the secret of it, that it hurts one's eyes and yet one must see it." But, he said to me with his deep laugh, "instead of giving me my due as a sculptor—as to the quality of my work—they say I am a poet. Of course, when one is inspired one is a poet. Yet when they say that my inspiration gives a certain value to the theory of the poet neighbouring on folly, there they are wrong. *Je suis le contraire d'un exalté*."

In regard to this saying I asked him why he had represented Hugo naked, and he said: "*C'est plus beau*." Then he said: "It is for the Pantheon—a man in modern dress would not be in keeping there." I give here the stanza I wrote on *Le Penseur* :—

Out of eternal bronze and mortal breath,
And to the glory of man, me Rodin wrought;
Before the gates of glory and of death
I bear the burden of the pride of thought.

II.

In *Orpheus and Eurydice* there is shown the majesty of sorrow, the very passion of life (as in the Keats-like face), and in one who descends upon him like a wind or a flame, and in the marvellous suggestion of a body which weighs nothing. One sees in it the smoke of hell rising about them in the hollow of the cave, and in Orpheus' gestures as he cover his face with his hands, a sign of exquisite despair. The Alcestis, held in the arms of Admetus, as Mercury, seated beside her, waits to take her with him, is superb: the faces seen in a great gulf of shadow.

Take, for instance, two figures that I saw in his studio. One, a woman, rigid as an idol, stands in all the peace of indifference; the other, a man tortured with desire, every muscle strained to exasperation, writhes in the ineffectual energy of a force which can but feed upon itself. She is there, before him, close to him, infinitely apart, and he could crush but never seize her. In the exquisite rendering of the Temptation of Saint Anthony the saint lies prostrate, crouched against the cross, which his lips kiss feverishly, as he closes his pained eyes: the shoulders seem to move in a shuddering revolt from the burden which they bear unwillingly; he grovels in the dust like a toad, in his horror of her life and beauty which have cast themselves away upon him. And the woman lies back luxuriously, stretching her naked limbs across his back, and twisting her delicate arms behind her head, in a supple movement of perfectly happy abandonment, breathing the air; she has the innocence of the flesh, the ignorance of

the spirit, and she does not even know what it is to tempt. She is without perversity; the flesh, not the devil; and so, perhaps, the more perilous.

The artist should never consciously aim at strength; but, conscious of his strength, he should aim at the utmost subtlety of strength. What I mean will be quite clear if I recall two Greek marbles which I once saw in a private exhibition in London. In one, the head of an old man, strength went as far as strength could go without being changed into some further and higher substance. The truth and energy of the head, gnarled and wry, with its insistence on all the cavities and disgrace of age, are only to be compared, in Greek art, with the drunken old woman in Munich, or in modern work, with *La Vieille Heaulmière* of Rodin. The drunken woman is indeed a more "harrowing lesson in life" as she sits hugging her wine-jar. In the old man you have the restraining strength of a will which endures age and pain with gravity. There is strength in it and truth, and there is the beauty which grows up inevitably out of a sufficiently powerful truth. But let us look across at another head—the head of a woman, which does not seem clever at all; which seems curiously simple, as if the difficulties of the art of sculpture had been evaded rather than conquered, yet which ravishes the mind into a certain quiet and fullness of delight. You do not notice it for strength, for any ingenious mastery out of any evident difficulty. Venus rose out of the waters, when human beauty came consciously into the world, not startling anyone, but like a dream that has come true. The forehead and cheeks are no subtler than a flower; the neck in its breadth from chin to nape has no refinements on an actual neck in which one has felt life rather than seen beauty. And you will see what is not in the other head, the lack of which leaves it where it is: a something incalculable, something which begins where truth leaves off, something which transforms truth.

And I am not sure that you will find this something in the bronze of *La Vieille Heaulmière* in the Luxembourg gallery. Wasted, ruinous, "lean, wizen like a small dry tree," this piteous body remembers the body it had when it was young, and the beauty is still there, in the lovely skeleton that shows right through the flesh, in the delicate contours of the almost hairless head, in the indestructible grace of the profile. This "poor old light woman" is more tragic than the old drunken woman in Munich; but as one looks at the old drunken woman, one sees only the sordid pity of things as they are, while *La Vieille Heaulmière* is saying "Thus endeth all the beauty of us," as it can be said by those who have fastened "the sweet yoke" of beauty upon the necks of the world.

Whatever may be the precise economic position of Germany at the present time, the condition of the people is gravely occupying the public mind. The following appeared recently in the well-known Berlin paper, the *Vossische Zeitung*:

"When the Reichstag reassembles in December it will have to consider questions of social policy, which have already been gone into by the Reichstag Committee concerned. It is probable that the proposals for the protection of mothers and children will be accepted without much alteration, as the parties are already unanimous as regards them. The proposals mainly concern young working women. It is suggested that, during war-time, there should be an eighth-hour shift, where there is regular day and night work, and elsewhere a ten-hour shift as a rule; every second Sunday at least to be a complete holiday; ten weeks' rest after child-birth, and special regulations for the protection of those working with poisonous or explosive materials. Expert committees to deal with the wages question are to be established without any delay.

There is also to be adequate factory inspection, and extensive provision for cases of accidents, as soon as possible. It is proposed to extend the committees for the settlement of disputes. The following improvements are strongly recommended: Extension and better financial endowment of consultative bodies for the care of infants, care of school children, children's homes, the supervision of crèches and infant schools (Kindergarten), and establishment of inspection of private homes for the care of children whose mothers are increasingly employed in factories and elsewhere during the war.

Finally, the Federal Governments are to be requested to provide more homes for illegitimate children of tender age, and make the conditions for their reception easier. The question of general guardianship will be regulated.

A recent article in the *Hamburger Fremdenblatt* states that ordinary people in Hamburg have had no eggs for five weeks. The preserved eggs of the Hamburg War Supply Bureau are reserved for civil and military hospitals, children under three years, and sick people in general. For these no less than 150,000 are needed weekly, and it is often no small source of anxiety to the War Supply Bureau to provide this number continually. In spite of this, before Christmas there is to be one general egg distribution, and three distributions of egg-powder prepared from eggs under the supervision of the War Supply Bureau, eggs which remained over in previous general distributions, and had to be made into powder to prevent them from going bad. Each packet of this egg-powder has the full value of one egg, and will be specially welcome to housewives at Christmas.

Industrial Self-Government

By Jason

IT was well put in the *New Statesman* the other day that competition was the nineteenth century substitute for honesty. Men like Brougham believed that so long as the wants of the world were supplied by a great number of individual traders and producers, each trying to outbid the other, the consumer was bound to get the benefit in cheapness and efficiency. Some who preached this doctrine went so far as to think adulteration was a form of competition and therefore innocent if not actually beneficent. The spectacle of waste was positively encouraging when the waste took the form of the reduplication of effort and the multiplication of services. For though it might seem absurd that twelve small shops should all turn out the same commodity, employing six times as much energy as was needed for the purpose, this struggle was a guarantee that the commodity would be cheap and good.

This philosophy had, of course, broken down before the war. For it happened in many important instances, particularly of course in America, that the consumer found that he was getting the waste without the benefits of competition, for it was possible for traders to eliminate competition and to secure that the advantages of the resulting economies accrued to themselves, and not to the consumer. The big Trust represented from many points of view an improvement on the old chaos of competition. As an industrial organisation it was vastly superior. It could buy and sell with much less labour, and it could take larger and longer views than the individual producer or the individual trader; it could appreciate the importance of research, education, and pay regard to the permanent as distinct from the transient interests of an industry or trade. But the very fact that the Trust was more powerful for good than the individual and isolated trader meant that it was also more powerful for evil. The Trust thus became a danger to the world in proportion as it became a weapon to those who were directing it. In the United States, as everybody knows, the tyranny of the Trusts was the chief domestic problem before the war.

Organising Power

It is quite clear that after the war the tendency of industry will be more and more to organise its power and resources, and that the habits of the age of competition, to which our individualist temperament has clung so jealously will go out of fashion. This development will be encouraged by many influences. For one thing, the war has taught the necessity of organisation in the face of the organised competition of other countries. We know now a great deal more than we knew four years ago about the methods of peaceful penetration by which German industry pushed its way in the world. Some of those methods are creditable to the country of their origin; some are not. But of their effectiveness there can be little question. It is believed by many good judges that if Germany had had the sense or the self-control to remain at peace for another ten years, her industrial power would have reached an extraordinary perfection.

Let anybody picture those methods to himself and then let him turn to the account given of our pre-war system by Mr. Ernest Benn in his able and interesting little book *Trade as a Science* (Jarrold and Sons):

I recently had an opportunity of inspecting the stock list of a well-known carpet manufacturer, which contained two hundred and fifty items. Fifty of these were specialities, and two hundred were regular lines which, except for trifling differences, were common to the whole trade. I found a standard pattern of stair-carpet, which I was informed was made by at least twenty different makers, in stock to the extent of £2,000. Now note exactly what this means. Supposing that each of the twenty makers had the same amount of stock in this standard line, you get at once £40,000 worth of capital sunk in this one pattern of carpet, certainly ten times as much money as is justified by the demand for this pattern, or any use that it is to the trade. But this money is locked up in obedience to the dictates of the fetish which we call competition. And then without asking the reader to bother himself with too much arithmetic it is perfectly obvious that if these twenty mills could agree among themselves to divide up the two hundred and fifty patterns and organise between themselves a selling staff which would cover the world, we should do three things: We should first of all dispense with a considerable portion of the machinery and plant used in that industry; we should next reduce the stock, which is one of the most expensive items in connection with the conduct of a business, to one-tenth of its existing proportions; and, in the third place, where one thousand men are now engaged selling the product two or three hundred could do everything that is required.

I shall be told that I am killing competition, but I do not agree. Is there any justification for twenty travellers representing twenty mills running to Inverness because some small buyer wants a few rolls of stair-carpet?

Obsolete Methods

It is certain that the experiences and revelations of the war in this regard will strengthen Mr. Benn's plea. Nor is this the only direction in which industry has been taught that the methods of the past are obsolete. We hear a great deal about the need of Government help and guidance, but Government help and guidance imply the existence of organisations with which the Government can deal. A Department cannot spend its time issuing circulars to hundreds of firms, giving separate interviews to hundreds of manufacturers or traders on every topic on which its help is sought. Effective co-operation between a Government and an industry is only possible when the industry has some representative organ. During the war there has, of course, been a great development of industrial organisation for this very reason. The Government found it necessary to interfere with one industry after another; to curtail supplies here, to divert energy there, in a third case, to change the uses of machinery, and perhaps in a fourth to modify the whole structure. This could only be done where there was some body that could speak for the industry and discuss its arrangements and circumstances, and the best means of adapting them to the emergency. In the case of munitions, of cotton, of wool, for example, the need for the direction of energy and resources by the Government has led to the forming of groups and representative committees. This has been specially important in the case of the woollen industry, for here organisation was in a very imperfect and elementary stage, and the old individualist regime was particularly tenacious.

In these two ways, not to mention others, the war has made it certain that organisation in the form of trade associations will be the leading feature of the industrial developments of the future. Industries are not going to unlearn everything the war has taught them at a time when the need for combined action will be more apparent and more urgent than ever.

The general function of such an association will be that of eliminating waste, securing the maximum production in quantity and quality, providing for the true and permanent interests of the industry as a service—that is, as an association of producers and merchants who are providing something that the world wants. When industry is so regarded, it has a noble aim and should have a correspondingly high standard of duty. Take such a matter as research and technical improvement. It is obvious that an industry as a whole is profoundly interested in adding to the knowledge of mankind on the questions that affect industrial progress. An individual trader may not so conceive his personal interest. He is perhaps in the industry to-day, but he means to clear out tomorrow. His routine methods bring him in decent profits and he sees no reason for spending money or labour on improving them. If he has a secret, so much the better. He has no wish that his friend and neighbour, who happens to be a rival, should share his secret or have one of his own. In this respect an individual producer or trader may be in the position of the individual citizen in regard to vaccination. It is clear that universal vaccination is a gain to the community as a whole, but a particular individual may think that it is not worth his while to go to the trouble of being vaccinated, for the risk he runs of getting smallpox in a country where vaccination is general is very slight. So the individual trader may have no objection to industrial progress and yet be unwilling to go to trouble or expense on his own account to promote it.

Representation

But a body that represents an industry will take pride in the care and success with which industrial methods are discovered and perfected, and it will appreciate the importance of endowing skill and research. The individual trader may say in the spirit of a famous declaration, that he has no need of chemists, but the body responsible for an industry as a whole will not be guilty of such folly. For it will be at once an injury and a disgrace to that industry that it should find itself short of some necessary material because Germany or America has known the worth of the chemist and England has not. So with all the waste that comes from bad organisation. A Trade Union leader with experience of war arrange-

ments remarked to a friend the other day: "We have learnt that bad trade is another name for disorganisation."

If we look at any particular industry as an organised society for producing a particular thing, we see at once that a great deal of energy and a great deal of capital are simply squandered for the reason that the principle of the division of labour is not applied in any scientific sense. It would follow if that principle was applied that the different establishments in an industry would produce the particular variety of article for which they were best fitted, and that there would be a governing sense of perspective in the arrangement and structure of its organisation. The old economists thought that the system of *laissez-faire* would secure this, and that if trade were left alone, each commodity would be produced in the place where it was easiest to produce it. This was a very rough law and in practice it does not prevail. It is not true, in fact, of the economy of the world, for it does not take account of the ambitions and the prejudices of nations. A people is often reluctant to admit that geography has determined once and for all the limits and the character of its production. Inside the boundaries of a nation there is a similar impatience of the laws of economic predestination, even if those laws are clear and unmistakable. But the discovery of those laws depends on a comparative survey of different facts of the industry, and such a survey was as a rule impossible under the old charter conditions. During the war it has been a matter of life and death to find out where and how this or that article could be produced with the least waste of energy and plant, and that guiding criterion will not disappear after peace.

Buying and Selling

Look again at the whole machinery of buying and selling. Our experience in industry has been not unlike our experience in agriculture. It is distressing to contrast the plight, we may almost speak of it as the wilful plight, of the English farmer with something to sell and that of the French or Italian peasant. In the one case there is no organisation; individual sellers deal with individual middlemen; there is waste of transport, and men whose business it is to produce spend time in the quite different function of marketing. There are, in the various stages that separate producer from consumer, intermediaries who serve no useful purpose, making their profits out of consumer or producer or both. In the other case, the peasant belongs to a co-operative society which collects his produce, carries it to market and sells it with full knowledge of the special business of the market. In industry there is something of the same contrast, for our producers send out armies of competing travellers to little towns on the Continent to collect single orders for single firms, whereas one man fully equipped with knowledge of languages and foreign customs could take the place of a dozen and do their work more effectively.

But if we merely get a number of trade organisations, working on sound and modern lines to increase production and eliminate waste, are we not merely putting ourselves into the hands of a number of Trusts? How can we secure the interests of the consumer?

It is here that the experiments of the war are full of instruction and guidance. The first principle in those experiments is the public ownership of the raw material. The great example of course is the purchase of the wool grown at home and in the Australasian Dominions.

Now the immediate effect of this policy is to eliminate one demoralising feature of trade: the gambling in the raw material, with its sinister consequences to industry and to the consumer. The policy of public purchase was dictated by national necessity. So momentous a departure from custom could not have been taken under any other conditions. But it is becoming quite clear that national necessity will survive the war, and that after peace it will be essential to our safety to continue this policy, at any rate in certain cases and for a certain time. With a greatly reduced shipping service for the world, with a scarcity in food and raw material, we cannot possibly trust ourselves, our industries, our fortunes to the rough scramble of the market. Organisation will be just as necessary, at any rate for some time after the war, as it has been during the war, to ensure supplies and to prevent irregularity and waste. Here then is one principle of fundamental importance, for if the State buys the raw material, it helps to that extent to control prices, and it acquires at once a right to some say in the distribution and use of that material. It would be as unreasonable after peace, as it would be during war, to say that the different industries that require a particular raw material or the different producers in a single industry are to fight it out among themselves, and that the State is quite indifferent whether or not this industry, or this district, or this group of establishments finds itself without any share in the necessities of production. We don't want

civil war between Yorkshire and the Midlands, between the cloth manufacturer and the hosier, between the man who uses leather to make saddles and the man who uses leather to make boots. The system known as rationing will therefore continue to be necessary as between industries, districts and individuals after the war.

An Important Innovation

There is another important innovation during the war which strengthens the hands of the Government as representing the consumer in dealing with a trade association. There has been many experiments in fixing prices, some of them more successful than others. But the most important system that has been tried is the system of costings. This system is well established in America, but in England it is quite modern, and if it had not been for the shock of the war, it would probably have been slow in development.

It is notorious that before the war a great many men of business took no trouble whatever to ascertain or understand the details and distribution of their expenditure. When the Ministry of Munitions set up in business the application of some standard of costs was imperative, for it was obvious that the strictest economy would be necessary if the nation was to prosecute the war with energy and success. When millions of men and great quantities of plant were to be diverted from productive to unproductive work, the waste of energy or plant or public money became a serious crime against the nation. The Department had the advantage for this purpose of its own experience as a producer, for it set up national factories, and at the same time it had the advantage of its opportunity of comparing costs and processes in the different establishments to which it gave contracts. What it has been learning gradually has been how much a particular operation should cost if undertaken under the best conditions, and thus it has discovered not only where that particular operation had better be performed, but how much it should cost. If a particular manufacturer said he could not make a shell at the fixed price, the Department could examine his costs with him and give him the benefit of the experience of other manufacturers and the experience of the factories administered directly by the Ministry.

The principle has been adopted in other industries and notably in the woollen and worsted industry. Its introduction serves two purposes. It helps to teach manufacturers the importance of costings, and it helps to protect the State from extortion. But it is obvious that this device enables the State to protect the consumer as well as the taxpayer, and that it is practicable in greater or less degree to control prices by this method. A trade association which takes its raw material from the State, allocates it on some recognised principle of justice and public convenience, and is prevented from forcing up prices by a control exercised by means of a system of costings and a public audit, is a very different body from the kind of Trust that menaces society. Such safeguards are imperatively necessary, for an organised industry collecting into one volume the energy and power both of employers and of workmen, would be able to apply a dangerous pressure if the consumer had no effective means of defence. And yet the industry loses nothing of its effective power as a producing organisation. It has every encouragement to promote research, efficiency, economy and good administration, for the stimulus to the pursuit of these objects is not the speculative profit of the individual trader, but the general sense for the common interests of the industry.

The war has taught us that there is a type of relationship between the State and industry which avoids the evils of a crippling State control on the one hand, and those associated with the dangerous power of a Trust on the other. In a further article it will be interesting to examine the light thrown by these experiments on the prospects of the Whitley Councils.

Poland may yet cause trouble between Germany and Austria. The *Tagliche Rundschau* describes the proposed Polish settlement as "an astonishing demand upon the nerves, patience, and good humour of the German nation." It continues:

"If the Hapsburg Kaiser of Austria is, with our approval, to be crowned King of Poland, then the last trace of any German rights or influence in Poland will have vanished. We shall ourselves have done what no Power in the world could have otherwise done, and our troops in Poland will only be Hapsburg police and our three years' sacrifices will have been made, not for ourselves, but for other people. Our position in Poland at the general peace conference will have been completely thrown away. Who has the courage to do this fateful thing? Not a Chancellor, for in reality we have no Chancellor, but only an irresponsible Foreign Secretary. It is he, Kuhlman, who during the interregnum of twilight between the old and the new era, has been busy with his friend Czernin deciding Germany's fate. What could be more fatal than a Hapsburg Poland strengthened by a Hapsburg Galicia? It would, too, be a thorn in the flesh between us and Austria-Hungary."

Psychology of the Spiritualist

By Dr. Charles Mercier

IRA *furor brevis*. A man in a violent rage is not at the top of his form in reasoning, and is apt to do things that appear at the time foolish to other people, and that in his own subsequent cooler moments he regrets. So it is if he is under the influence of terror, of panic, of jealousy, or of any other emotion. This, as we see from the Latin quoted above, has long been recognised. It has certainly been known for two thousand years: it has probably been known for two hundred thousand. No doubt the aphorism was scratched upon their copy-books of reindeer horn by the children of Mousterian and Aurignacian man in the early Pleistocene age. It holds good, not only of the violent emotions of anger, fear, jealousy, and so forth, but also of the milder emotions of amusement, awe, and wonder. Emotion and reason are mutually antagonistic, and tend to exclude one another. We could desire no better instance than the ludicrous inability of the Germans, in the intensity of their hatred for America, to recognise that Americans, in supplying munitions to England in the present war, are doing precisely what the Germans did in the Boer War.

People who are emotional, that is to say, whose emotions are easily aroused and under little control, are bad reasoners. The vitiation of their reasoning by their emotions extends over a wide area of their thoughts, and is readily brought about. They are swayed by moods and impulses, and as far as they reason, their reason is the servant rather than the master of their passions. In the presence of what is unusual, for instance, they give free rein to the emotions of wonder and awe, and under the dominance of these emotions they become incapable of reasoning upon the matters that arouse the emotions.

Contrasted with persons of emotional temperament are those whose feelings are under control, and are the servants or auxiliaries rather than the masters of their reason. Their proclivity is not to the passive indulgence in feeling but to the active exertion of intellect. In the presence of what is unusual and mysterious they do not surrender themselves to the passive enjoyment of awe and wonder, but rather seek actively to investigate, discover, and explain. Persons of emotional temperament are by nature spiritualists—the investigators are the scientific.

Desire for Explanation

Whatever his temperament, whether emotional or scientific, man ardently desires explanation; and especially in the presence of what is unusual, he is not content until he has an explanation of some kind. Spiritualism is explanation by the short cut. It is the explanation of those who are too impatient to untie the knot, and prefer to cut it. To untie the knot, to seek the natural causes of events, is often a slow, laborious business. It is an intellectual exercise requiring thought, care, patience, and industry; and during the exercise of these faculties emotion must be put on one side. To ascribe events to the direct action of spirits is the easy explanation of the lazy man: it is also the crude explanation of the unintellectual man. It needs no thought, no industry, no care, no patience. Anyone can do it. It is within the competency of the idlest and most ignorant of men.

In the earliest stage of the history of our race, every event was explained by the agency of spirits. Spirits caused rain and sunshine, storm and flood. Spirits blighted the crops or ensured their increase. Spirits gave or refused success or failure in hunting and fishing and all other undertakings. Spirits guided the arrow or the spear to the mark, or caused it to miss. Spirits produced aches and pains, injuries and diseases. Spirits upset the canoe or guided it to its destination; gave victory or defeat in battle; made the fire burn or go out, and were the arbiters of good fortune and ill fortune in everything. The whole progress of mankind from ignorance to knowledge, from savagery to civilisation has been marked by, even if it has not consisted in, the gradual wresting of causation out of the hands of spirits and ascribing it to "natural," by which we mean non-spiritual, agency. The degree to which man has advanced in the intellectual scale may be measured by the magnitude of the field in which events are ascribed to natural causes, and the restriction of the domain of spiritual agency. *Prima facie* the ascription of any event to the action of spirits is a relic of savagery, is the outcome of the impulsive, emotional, unregulated ignorance characteristic of primitive humanity.

In the physical universe, friction, that is to say, interference with the free action of any mode of motion, always produces heat. In the mental world interference with the free play of

any emotion always produces anger. The analogy is so close that it is recognised in common speech. We speak of the interference of one man with the action of another as friction, and we often speak of anger as heat. Questioning of our convictions and opposition to our convictions arouses our anger in proportion to the lack of reasonable ground that we have for our conviction. It would be very difficult to arouse the wrath of a mathematician by disputing the accuracy of the multiplication table. He might be amused, but he would scarcely be angry. No astronomer would lose his temper if you contended that the earth is flat and that the sun circulates round it. His conviction is too securely rooted in reason. As a matter of fact, it is the flat-earth crank who loses his temper when his conviction is questioned; and the reason is clear: he feels the ground of his conviction insecure. Judged by this criterion, the conviction of the spiritualist that the marvels he ascribes to the spirits are really due to spiritual agency, is not very firm. He protests a little too loudly; he is too easily roused when his conviction is questioned. No doubt his emotional temperament is largely responsible for this. As with the rest of his emotions, his anger is easily evoked; but still, even his anger would scarcely be evoked by questioning the accuracy of the multiplication table. No. He resents your doubts of the spirits because he is not quite sure of them himself. He would deny strenuously that he has any doubt of them, but if he has no doubts, why do yours make him so angry?

Spiritual Action

The hypothesis of spiritual action is a rough and ready pseudo-explanation of occurrences that are for the time being and to the spiritualist, unaccountable by natural causes. As soon as the natural cause is discovered, as according to all precedent and all analogy it must be eventually, the spiritual hypothesis must give way and suffer abolition in these matters as it already has had to suffer abolition in numberless others. In the minds of rational persons, that is of persons whose emotions are well under control, a rational explanation is accepted as soon as it is shown to account for the facts; but emotional persons are not thus convinced. Their intellects are the servants of their emotions, and, instead of acting to reconcile the new and unusual occurrence with the general order of nature, they are employed to show cause why the general order of nature should on this occasion be interrupted and falsified, and very curious and amusing some of these reasonings are.

In 1864 the Davenport Brothers made a great commotion in this country by performing a number of tricks, which they declared were produced by the aid of spirits, a declaration that found many fervent believers. Messrs. Maskelyne and Cooke were convinced that these tricks were produced by natural means, and after a little study and practice, succeeded in imitating them with complete accuracy, excepting only that they took a little longer. In these circumstances, what line were the true believers in spirits to take? It was clear that if the one pair could produce the effects by natural means, the other pair might have produced them in the same way, and there was no call for spiritual intervention. The spiritualists did not hesitate. They declared that it was not the Davenport Brothers but Messrs. Maskelyne and Cooke who were lying, and that while the latter pretended to perform the tricks by natural means, they were, in fact, mediums, and performed their tricks by the aid of spirits, whom they deceitfully refused to acknowledge.

Ten years after, a photographer named Bugnet drove a roaring trade in spirit photographs. He was eventually prosecuted in the French Courts for fraud, and made a full confession. He used plates which had already suffered a brief exposure, the sitter to this preliminary exposure being at first one of his assistants, and subsequently, as the business increased, one of a number of dummy heads fitted on to a lay figure. Even so, however, his business was so large that the same head had to do duty as the sister of one sitter, the mother of a second and the wife of a third. Notwithstanding this confession, in which Bugnet revealed his whole *modus operandi*, and the production in court of his lay figure with a large assortment of heads, his victims refused to believe, or at any rate to confess that they had been imposed upon. Witness after witness of good social position, with, of course, some professors amongst them, testified that no trickery had been practised. It was impossible. The portraits of their dead friends and relatives were unmistakable.

At one time a popular exhibition by spiritualistic mediums

was "materialisation." It has so often been exposed that it is not now much resorted to. The medium was tied in a chair, or locked in a cupboard, or only perhaps merely hidden behind a curtain, or even took his place in a circle round the table; then, the room being dark, or almost dark, spirit forms would be seen gliding about, spirit hands would pat and slap the sitters, luminous hands and faces would hover in the air, and so forth. Over and over again the spirits were seized by a sitter, or an unexpected light was turned on, and the materialised spirit was found to be the medium himself or herself. The medium sometimes owned up and confessed the fraud; sometimes the fraud was too palpable to need any confession; but in either case the devotees did not give in. They were ready with a spiritualistic explanation. This was that the spirit form was an "emanation" from the body of the medium. When it had shown itself, it went behind the curtain or wherever the medium was, and reunited itself to the medium. When, however, the spirit form was seized, the material body of the medium was compelled to come out of its trance and unite itself with the spirit. Even when the reunited spirit-and-medium was searched, and in its pockets were found false beards, bottles of phosphorised oil, yards of muslin, and other make-up materials matching the appearance of the spirit-forms, the spiritualists unblushingly asserted that the medium had been controlled by a bad and lazy spirit, who had brought the muslin, etc., to save himself the trouble of "materialising"

it. Again, when mediums have confessed to hoaxing their sitters, and have explained how the hoax was effected, the sitters have accused the mediums of lying, not when they performed the hoax, but when they made the confession.

The latest manifestations of mediumship are ingeniously contrived so as not to be open to rude, sudden, and dramatic exposure. The mechanism by which raps and taps are produced may be and often has been identified, and the raps and taps put a stop to. The way in which the spirit-photographs are faked, and spirit materialisations produced may be discovered and exposed; but if a medium talks or writes, and says the talking or writing is done, not by him, but by a spirit that possesses or controls him, and that he, the medium, knows nothing of what the spirit says or writes, it is manifest that we cannot expose the imposture. As no trick tables, no false beards, no phosphorised oil, no properties of any kind are used, none can be discovered, and the medium is safe from exposure. The only safeguard against deception is common sense; and experience shows that this is not to be relied upon, at least, its existence in spiritualists cannot be relied upon or even discovered. It is manifest that reason does not appeal to their minds. They are governed solely by emotion. They enjoy being deceived; why attempt to deprive them of an enjoyment so highly appreciated and so easily attained? Let me end as I began, with a Latin tag—*Populus vult decipi: decipiatur.*

The Sewing Machine

By Etienne.

WE all know that in the Early Days we were very short of those munitions of war which at the moment of writing are being showered with prodigality upon the Hun in Flanders. In those early days light cruisers sometimes found themselves in harbour for two or three days. It wasn't much of a harbour, its chief advantages being that in one corner was a hulk in which mails and parcels accumulated, and that the sea inside the harbour was appreciably better behaved than the sea outside. The edge of the harbour was a long way off, and looked its best at a distance. The attractions on the beach were nil to anyone who had the least feeling of citizenship—that is, to a lover of cities.

It was generally blowing a bit and anchor watch absorbed 25 per cent. of one's life. Hence a large number of officers found that after the restful effects of the first twenty-four hours in harbour had passed off, a feeling of boredom supervened. Some clever person suggested that perhaps the Navy would like to make munitions in its spare time. The Navy said it would be charmed, and it was decided that we should make gromets to protect the driving bands of shells.

So successful was this venture that the Ministry of Munitions wrote a little letter in which they patted us on the back and then said: "If we give you a sewing machine, will you make lifting slings for shells?" We said we'd do our best, and shortly afterwards a storeship came alongside us and dumped a large packing case on our quarter deck.

The supply note described its contents as "Singer Treadle Machine Sewing, Patt. III., No. 1567." A carpenter's mate split open the packing case and the Duty Hands reverently carried it down to the smoking-room. The news soon travelled round "Morality Row" and "Paradise Alley," our two streets of cabins, and the occupants, delighted to hear of the arrival of the strange instrument, hastened to the smoking-room. When I got there, the visitors to the exhibition included the Engineer Commander, his Senior Engineer, the two Doctors, the Paymaster, and a couple of watch-keeping Lieutenants, Brown and Williams.

We were gingerly fingering its various parts and speculating on their functions when "the Irrepressible" burst into the smoking-room. "The Irrepressible" is our Sub, and he rather fancies himself at impersonating gunners' mates, and drill instructors. True to his habit he immediately let off:

"Now what 'ave we 'ere—'ere we 'as a sewing machine. Now the object of this 'ere himpliment is to sew, and I'll tell yer the reason fer why, Class T'shun!"

"Dogs of war, out Sub!" remarked Brown.

As one man, every one below the rank of three stripes hurled themselves on the Sub, and a Homeric struggle was in progress when the arrival of the Commander restored comparative peace.

"I understand the Service Sewing Machine has fetched up," said the Commander.

"Yes Sir!" replied the Sub. "We 'ave been fortunate 'nuff in this 'ere ship to secure one of the latest Marks, this 'ere magnificent hinstument operating at 'igh pressure can sew

thirty-five yards of No. 11. canvas to a similar piece in hunder one 'our, or halternatively it will sew seventeen and 'arf yards of canvas in 'arf a similar period."

"Always supposing we find someone who can work it," remarked the young doctor. "Now when I was at Barts, I had quite a lot of experience with stitching, and I think I could drive this gadget!"

"I may as well say without further delay," remarked the Commander, "that by virtue of my offices as Commander of the ship, and Mess President, I am going to dig the first sod, or drive the first stitch, or whatever one does when one christens a sewing machine. Meanwhile——"

"Thank you, Chief, you have divined my innermost thoughts. I was just going to ask you to agitate the line of communication between this spot and the pantry. We have before us a task which cannot be tackled without stimulants. Now, Sub, give me a chair."

A chair was placed in front of the machine, on which the Commander seated himself. Amidst breathless silence he placed his feet on the treadle and started the machine. His action was faintly reminiscent of a great organist trying a few preliminary chords. After a few revolutions he stopped the machine and leaning back in his chair remarked with much satisfaction: "So far, so good, it seems to have its gearing connected up all right."

"Don't you think, Sir," said Brown, "we'd better trace the lead of the thread?"

"Good idea," replied the Commander. "I take it, it goes like this—from the reel——"

"Or bobbin," interjected the Sub.

"I said from the reel," continued the Commander.

"I believe the best seamstresses invariably refer to it as the bobbin, Sir," said the Sub in an aggrieved tone.

"If the Sub puts me off my stroke again, sit on him, Brown," said the Commander. "Let me see where was I? Oh, yes, it leaves the bobbin—damme! I mean reel, which presumably revolves on this vertical spindle. Thence by a leading block——"

"Do you mean this small pulley?" enquired the Chief.

"Yes, I do!" replied the Commander pugnaciously; "it leads the thread along doesn't it? And doesn't a leading block lead a wire along the upper deck?"

"Well, I suppose you could call it a leading block," admitted the Chief.

"From this block it proceeds," continued the Commander "to er—er—er, let me, see, oh, yes—to the head of the machine."

"The where?" asked the Paymaster.

"The head of the machine, Pay, this left-hand part, containing this piston-like apparatus, on the end of which the needle moves up and down."

"Ah! But how does it get to the needle?" triumphantly asked the Pay.

"How does it get there?" scornfully ejaculated the P.M.O. "Why, any fool can see it goes down through these little rings."

41 Generals and 8 Admirals!

Impressive Facts about "Pelmanism."

THE remarkable extent to which the new movement—Pelmanism—is being adopted by officers and men affords impressive reading.

There could, indeed, be no finer or more convincing evidence of its intensely *practical* value than the fact that over 10,000 British officers and men (Naval and Military) are studying it whilst on active service. All correspondence being confidential, no names can, of course, be published.

From time to time the announcements made by the Pelman Institute have included some of the more interesting letters from officers at the Front or with the Grand Fleet, giving more or less precise particulars of the direct benefits accruing to them from the adoption of Pelman principles. Promotion, distinction, increased efficiency, a keener zest for work: self-confidence, individuality, judgment, decision: a perfect memory (most valuable of qualities in this super-scientific war), concentration—these are some of the benefits daily recorded. Small wonder that a distinguished General writes that the value of the Pelman Course cannot be exaggerated. His letter, with others of special interest, will be found below.

Business and professional men are equally appreciative. The benefits of Pelmanism are so clearly apparent (and so invariable) that scepticism and prejudice have vanished. The facts recorded, *by students of the Course themselves*, dispose of all doubt or question as to the value of "Pelmanism."

If there is a reader of *LAND & WATER* who has not yet received a copy of *Mind and Memory*, in which the principles of Pelmanism are explained at length, and in which a full synopsis of the Course is given, he (or she) should write for this *brochure* to-day. It will be sent, *gratis and post free*, together with a full reprint of *Truth's* outspoken report on the work of the Pelman Institute, upon application to the address given at the foot of this page.

A Distinguished General's Verdict.

One of the most emphatic endorsements that the Pelman Course has ever received comes this week from a distinguished General with the B.E.F. He says:—

"The value of the Pelman Course can hardly be exaggerated. I agree it should be nationalized."

Following upon the remarkable letters recently published, in which Colonels, Majors, and Captains (both Army and Navy) have attributed their promotion, *and, in some cases, their distinctions*, to Pelmanism, the General's pronouncement is of special significance.

For the benefit of those readers of *LAND & WATER* who have not already seen the letters referred to, they are reprinted here.

"The Unsoldierlike Sub."

The first is from a Captain with the B.E.F. We give his letter in its entirety:—

"I should like to call your attention to the facts of the story of my Pelman Course.

"When I began I was looked upon with disfavour by the C.O. of my battalion at home as being a sleepy, forgetful, and unsoldierlike sub. When I began your Course my star began to rise—I had the ability, but had not been able to use it. I left the home battalion with my C.O.'s recommendation as being the best officer he had had for more than a year, and came to France.

"I was then appointed as a second lieutenant to command a company over the heads of four men with two 'pips,' and have now three stars and an M.C.

"That I was able to make use of my abilities so successfully I attribute entirely to the Pelman System."

That his is not by any means an isolated case is shown by the next letter, which is remarkable for its brevity. It is also from a Captain, who, in response to the question, "What have you gained from Pelmanism?" replied:—

**"Three Stars
A Military Cross and
A Clearer Head."**

Another officer suggests that the announcements made by the Pelman Institute err on the side of modesty. He writes:—

"One great point in favour of your system which, if I may say so, you do not make enough of in your advertisements is the cumulative benefit accruing.

"As far as I can see, once having got on the right track and rigidly following the System, there should be no limit to the ultimate mental capacity attained."

Each letter supplies its own adequate comment. Take the epistle of a Lieutenant-Colonel, who, writing from Salonika, says:—

"As a direct consequence of Lesson Two I have got a step in rank."

Similarly, a Major attributes his promotion *and his D.S.O.* to Pelmanism; the Captain of a fine cruiser thanks Pelmanism for his command, having been promoted by selection over the heads of senior officers!

There is, in fact, a bewildering mass of direct personal testimony to the value of the Course from every rank and from every unit of the British Army and Navy.

It is not always promotion that is the object of those who take up the Pelman Course. Here is a letter which presents another phase:—

"The Course has prevented me becoming slack and stagnating during my Army life—this is a most virulent danger, I may add. It inculcates a clear, thorough, courageous method of playing the game of Life—admirably suited to the English temperament, and should prove *moral* salvation to many a business man. 'Success,' too, would follow—but I consider this as secondary."

Easily Followed by Post.

To the uninitiated it may well appear impossible that such remarkable results can be attained in a short time as a consequence of half an hour a day for a few weeks spent in studying lessons. Yet it is the bare truth, and it should help readers to realise what a tremendous force for personal betterment "Pelmanism" is.

As a student of the Course recently wrote:—"If people only knew, the doors of the Pelman Institute would be literally besieged by eager applicants."

Following the intensely interesting lessons and exercises the students of Pelmanism rapidly develop a brilliant Memory, strong Will Power, complete power of Concentration, quick Decision, sound Judgment, an ability to Reason clearly, to Converse attractively, to Organise and Manage, and to conduct their work and social duties with Tact, Courage, Self-Confidence, and Success. All mental weaknesses and defects are, on the other hand, eliminated—such as Mind-wandering, Forgetfulness, Weak Will, Aimlessness, Bashfulness, Self-consciousness, the "Worry Habit," etc., etc.

Over 250,000 Men and Women.

The Pelman Course has already been followed by over 250,000 men and women. **It is directed through the post, and is simple to follow.** It takes up very little time. It involves no hard study. It can be practised anywhere, in the trenches, in the office, in the train, in spare minutes during the day. And yet in quite a short time it has the effect of developing the mind, just as physical exercise develops the muscles, of increasing your personal efficiency, and thus doubling your all-round capacity and income-earning power.

A full description of the Pelman Course is given in *Mind and Memory*, a free copy of which (together with *Truth's* special supplement on "Pelmanism") will be sent post free to all readers of *LAND & WATER* who send a post card to The Pelman Institute, 39 Wenham House, Bloomsbury Street, London, W.C.1.

Overseas Addresses: 46 Market Street, Melbourne; 15 Toronto Street, Toronto; Club Arcade, Durban.

**In 14 Months we saved
the lives of 7,000 of
Belgium's Little Ones!**

**WILL YOU NOT HELP
US TO SAVE OTHERS?**

THE BELGIAN CHILDREN'S FUND in Holland, (under the Presidency of H.S.H. Princess A. de Ligne) APPEALS FOR HELP in the work of bringing sick and debilitated children from Belgium into Holland, where they are fed, clothed, and medically cared for, and when restored to health returned to Belgium, for funds do not permit more.

Unless YOU Help, this Life-Saving Work in Holland cannot be continued, and many Children must perish.

Remittances to HON. TREASURER, "Working Men's Belgian Fund," (Registered War Charities Act, 1916), 32 GROSVENOR PLACE, LONDON, S.W.1.

Earmarked for the "Belgian Children's Fund."

On the Western Front 1914-1917.

BY

Capt. ED. HANDLEY-READ

(Machine Gun Corps),

With a Foreword by

HILAIRE BELLOC.

"THE Pictorial Records of the Great War are few. It is possible and even probable that they will remain few. . . . Of those who have attempted the task the artist whose work is here presented is among the most successful."

From *The Foreword.*

All particulars will be sent on application to:
THE PUBLISHER,
"Land & Water," 5 Chancery Lane, W.C.2.

MESSRS. LONGMANS' LIST

Strictly limited to 550 Copies. **RHODODENDRONS** in which is set forth an account of all species of the genus *Rhododendron* (including *Azaleas*) and the various hybrids.
By J. G. MILLAIS, F.Z.S.

With 17 Coloured Plates by MISS BEATRICE PARSONS, MISS WINIFRED WALKER, MISS E. F. BRENNAND, and ARCHIBALD THORBURN: 14 Colotype Plates, and numerous Illustrations from Photographs.
4to. 16 in. by 12 in., 28 Ss. net.

NEW EDITION OF THORBURN'S BRITISH BIRDS.

BRITISH BIRDS

Written and Illustrated

By ARCHIBALD THORBURN, F.Z.S.

New Edition, with 82 Plates in Colour, showing over 440 Species.
4 vols., 4to, gilt top. 48 Ss. net.

Vols. 1 and 2. Now Ready.

Vols. 3 and 4 will be ready between January 1 and April.

Orders can only be taken for complete sets, but each volume may be paid for when delivered at 12 2s. net each.

Two additional Plates with the accompanying letterpress will appear in Vol. 4, and will be issued separately, priced 6s. net, in the ordinary size, and 15s. net in large paper. The new plates will contain illustrations of several birds which have been added to the list of British Birds since the First Edition was published.

IRISH MEMORIES

By E. G. SOMERVILLE and MARTIN ROSS.

Authors of "Some Experiences of an Irish R.M.,"

"The Real Charlotte," etc.

With 23 Illustrations from Drawings by E. G. SOMERVILLE and from Photographs. 8vo, 12s. 6d. net.

The Story of the Declaration of Paris (concluded). By Sir FRANCIS PIGGOTT
(late Chief Justice of Hong Kong)

London: SPOTTISWOODE, BALLANTYNE & Co., Ltd., 1 New Street Square.

"Look here!" indignantly remarked the Commander, "who is giving the detail of this machine, you or me?"

"You are, Sir! I am not," pointedly replied the P.M.O.

"All right, then perhaps everyone will let me get on. To summarise then, it seems to me the following theory fits in with observed facts. As soon as motive power is applied to the system by means of this treadle and crank underneath—"

"I tell you what, Sir," jubilantly exclaimed Williams. "we could do away with the treadle, and gear up a neat little ½-horse power electric fan motor. We could use the one in the Pay's office; they love a fugg and never use it, and as a development of the idea we could fit a little indicating device with red and green lamps which would show us the number of beats of the needle per second."

"Nothing of the sort," said the Commander. "You, in your enthusiasm for that most unpleasant stuff electricity, would make this machine a fruitful source of shocks; you wait until you've been through the long course at the 'Vernon,' and then we'll allow you to monkey about with the electrical fittings of the ship. Till then you're a danger."

"Why not try and sew some canvas, Commander?" suggested the P.M.O.

"Good idea. Sentry, ask the Bo'sun to come this way, and to bring a couple of yards of canvas with him."

A few minutes later the Bo'sun, a certain Mr. Bolt, appeared on the scene. In the background lurked a hardy and ancient three-badged able seaman; a bunch of keys attached to a lanyard round his waist proclaimed him to be the Bo'sun's Yeoman. His secretive and miserly cast of countenance were also indications that he belonged to that great band of robbers, the store-keeping fraternity. In his horny fingers he clutched a small strip of the thinnest canvas supplied to H.M. ships. The strip was about two feet long. As soon as Mr. Bolt entered the smoking-room, he stopped dead as his gaze rested on the sewing machine.

"My Sewing Machine!" he gasped.

"I beg your pardon, Mr. Bolt," frostily remarked the Commander.

"I was only a-saying Sir, or in a manner of speaking, expressing surprise at seeing my—or I mean the sewing machine, which is one of my unconsomable stores, standing like this 'ere in the smoking-room."

"Well, Mr. Bolt, it's standing here because I intend to work it. Now, did you get my message about the canvas?"

"Yessir: And I have brought two feet of canvas as you sent along for, but if I might make a remark, Sir—"

"Well?"

"I should say, Sir, as 'ow it would be 'ighly injudicious to operate this 'ere machine before the 'and book on the subject arrives."

"What hand-book, Mr. Bolt?"

"Well, Sir," continued the Bo'sun, making a gallant effort to retrieve the situation, "in all the thirty years I've been afloat, I never 'eard tell of a new instrument arriving without a 'and-book of instructions, and more often than not an 'appendix as well."

"Do you mean to suggest seriously, Mr. Bolt, that I, as Commander of this ship, need a hand-book to tell me how to work a simple sewing machine?" indignantly demanded the Commander.

"No, Sir. Of course not. I was only 'azarding an opinion in a manner of speakin'."

"Very well, that's settled. Now let's have the canvas."

The canvas was produced and placed under the needle. A reel of cotton was put in position and the threadled along to the needle, through which after numerous unsuccessful efforts the young Doctor succeeded in threading it. His prestige rose so suddenly that he was emboldened to make another attempt to oust the Commander from his position of operator. It met with no success, the Commander taking refuge in the general statement that no bachelor could be permitted to try.

The canvas was divided into two strips, they were superimposed on each and placed under the needle. The Commander treadled vigorously, and the needle rose and fell and continued to rise and fall.

"It don't seem to be sewing, Sir," said Mr. Bolt in a voice from which he could not conceal satisfaction.

"Thank you, Mr. Bolt for the canvas. I think that's all we want," pointedly remarked the Commander.

Mr. Bolt is no fool, and rightly interpreted this as a signal for him to withdraw. It was, however, soon plain to the whole party that the Bo'sun's remark was only too true. The needle rose and fell in a most encouraging manner, but beyond puncturing the canvas, there was not the slightest sign of the two pieces being sewn together. A council was held, and after some discussion it was decided to reeve the needle "on the light." This accomplished, the Commander started

operations again.

He had been pedalling for about two minutes, again without result, when a piercing yell followed by a torrent of invective brought the padre hot foot from his cabin. He arrived just in time to see a Commander in the painful position of being pinned to a piece of canvas by a needle through the side of his thumb. The Sub did not improve matters by turning the machine in the wrong direction when the Commander called on him for help.

Our Commander is an obstinate man and believes in the adage, "There is nothing the Navy cannot do." This contretemps increased his determination to conquer the machine. In a moving little speech, delivered while the P.M.O. was bandaging his finger, he accepted a cocktail from the Chief and called on all present to give their joint opinion.

"There is only one thing for it," said the Chief, "and that is to strip her right down."

"Yes, that's the best thing to do; strip her down thoroughly," agreed the Senior Engineer.

"We will strip the perisher," announced the Commander with an air of a surgeon deciding on an operation, in a case of life and death.

"I'll send along for one of my artificers at once," announced the Senior Engineer. An interval of a few minutes elapsed during which period the officers gloomily surveyed the refractory machine.

The artificer arrived armed against all contingencies with a hammer, cold chisel, foot rule, screw driver and an assortment of spanners. He threw himself into his task with enthusiasm, and soon the proud machine was lying in pieces on the smoking-room floor. Each part was carefully examined by everyone, and it was whilst this was taking place that the quartermaster entered, and handing a small parcel to the Commander said:

"A small boat has just come over from the store ship, Sir, and they says as 'ow they forgot to leave this when they dumped the packing case aboard a couple of hours ago."

The Commander looked at the parcel, then looked at the label, emitted a faint groan and sank into the nearest chair. The P.M.O. gently withdrew it from his nerveless grasp and read out the superscription on the parcel. It ran as follows:

For Singer Treadle Machine Sewing Patt. III., No. 1567—Shuttles. Two in number—one spare—Patt. Va.

* * * * *

In the Warrant Officers' mess Mr. Bolt was remarking to his friend the gunner:

"Wot I sez is, stores are stores, but, Lor bless you, that don't make no difference to Ward Room Officers, they does wot they likes." It reminds me of a poetry my dear mother used to versify with; it was a pretty little piece and went:

For the rich gets all the pleasure
And the poor gets all the blame
It's the same the whole world over
It is a blinkin' shame."

British Birds

THE magnificent volumes of *British Birds** written and illustrated by Mr. Thorburn, F.Z.S., are already a classic. They have passed through two editions and the third edition is now being issued by Messrs. Longmans, Green, in four volumes complete. The first of these is ready; the second will appear very shortly and the third and fourth early next year. There are only a limited number published. In his preface Mr. Thorburn writes: "Being more familiar with the brush than with the pen it was at first my intention that this book should be simply a sketch book of British birds practically without letterpress, but as the work proceeded I was induced to write a short description of each of the various species represented, giving rough notes as far as possible of the distribution, nest and eggs, food, song and habits of the different birds." These descriptions are a fitting accompaniment to the wonderful plates. Never have the birds of the British Isles been portrayed with such exact similitude, and even the least observant person with these exquisite paintings and precise facts before him can have no difficulty in being able to identify any specimen.

Mr. Thorburn has given his life to this work; he has spent hours in studying birds in their natural habitats and the strength of his work lies in the extraordinary manner in which he reproduces not only the exact plumage, but the true poise and carriage of each. To glance at these plates carries even an amateur back to the country sets their music ringing in his ears. The painter has done splendid work for British ornithology; and one cannot be too grateful to him.

**British Birds*. Written and Illustrated by A. THORBURN, F.Z.S. With 82 Plates in Colour. In 4 volumes. 3rd Edition. Longmans, Green: 78s.

Life and Letters

By J. C. Squire

Sidelights on the Victorians

"BUST by Woolner." This phrase is familiar enough in catalogues and guide books, but very few people know who Woolner was or what sort of person he was. Nevertheless, Woolner was one of the original seven members of the Pre-Raphaelite brotherhood. As such he must necessarily be of some interest to the historian of nineteenth century art. And one opened his long-delayed Biography (*Thomas Woolner, His Life in Letters*, Chapman and Hall, 18s. net), in the expectation of learning something new about the Victorian era. By something new one does not mean something really surprising: such as that the great Victorians had blue beards or walked on their heads. What one means is that one expected something more than the tiny dribble of unknown letters that one usually gets in a book published so long after the event as is this one. One has not been disappointed. Woolner's daughter has had the extremely sensible idea of giving us an idea of his life through the letters he wrote and received instead of telling us in the first person, and at prodigious length, what her father said to her mother at breakfast on November 22nd, 1870, and recording at length the births, careers, deaths, and tombstones of the various dogs he owned in his life. Woolner corresponded with many of the most eminent men of his time. His most profuse correspondent was Mrs. Tennyson—whose husband, usually referred to here as the Bard, was evidently too lazy to write letters himself—and amongst the others were Rossetti, Coventry Patmore, Carlyle, Mrs. Carlyle, Vernon Lushington and others of the Pre-Raphaelite and Tennysonian sets. The book is a sort of tail-piece to the existing literature of the period, and all future writers about the Victorian age or its principal figures, will find something in it which they will have to quote. It is a noticeable thing—and one that throws a genial light upon Woolner's character—that almost all the hundreds of letters given are familiar and homely in tone. There are very few rhapsodies and there is very little fine writing; when communicating with Woolner people did not pour out their inmost souls, but, on the other hand, they refrained from anything forced or in the nature of humbug. The book as a whole, therefore, though uninspiring is amusing throughout.

* * * * *

Woolner was born in 1825 and died in 1892. In his early stages he was the friend of Rossetti, at his death he was an honorary member of a City Company. So it is to be expected that his early correspondence would be more interesting than his later, and the expectation is fulfilled. Especially good are the letters he received from Rossetti when, having despaired of earning his living as a sculptor, he was seeking his fortune in the gold fields of Australia. Later disciples of the Pre-Raphaelites tended rather to forget that the Pre-Raphaelites were the most robust of men. The apparent discordance between their characters and their works is not difficult to explain. They were artists, they were living in a smug, materialistic world which ignored the finer impulses of the spirit, and they went to extremes. It might almost be said that since the world around them thought of nothing but money, they deliberately painted and wrote about people who could not conceivably earn their living, and because they saw around them a generation peculiarly gross and bustling they were forced into the extravagance of creating ideal figures who might be deemed incapable of eating, and who in no circumstances could be conceived of as jumping a five-barred gate. But the languorous and swan-necked women of Rossetti, the attenuated, almost transparent, princesses of Burne Jones, the gentle Utopians of William Morris, were merely the escapes, as it were, of full natures starved in actual life. Burne Jones was one of the wittiest and jolliest talkers of the nineteenth century, and filled his letters with uncomplimentary caricatures of himself. The most characteristic story about William Morris is that which records the horror of a high ecclesiastic who, after standing a quarter of an hour in the poet's waiting-room, heard a loud voice come down the stairs: "Now send up that bloody bishop." Rossetti, until he took to drugs, was another of the same mould; and it gives one peculiar pleasure to find from Woolner's biography that, even at the beginning, when the Pre-Raphaelites stood to gain everything from the commendation of so celebrated a man, Rossetti could not stand the humbug of that pompous though well-meaning pontiff, John Ruskin. "As," he writes, "he is only half informed about art, anything he says in favour of one's work is, of course, sure to prove invaluable

in a professional way." Then very shortly afterwards Woolner sub-joins the following remarks:

I should like Ruskin to know what he never knew—the want of money for a year or two; then he might come to doubt his infallibility and give an artist working on the right road the benefit of any little doubt that might arise. The little despot imagines himself the Pope of Art, and would wear 3 crowns as a right, only they might make him look funny in London!

Add to this Rossetti's description of his own early and much photogravured *Annunciation* as "my white abomination," and the gentleman who bought it as "an Irish maniac," and we get a fairly good indication of the essential healthiness of the Pre-Raphaelite movement.

* * * * *

All through the book there are supplementary scraps for the biographers. In 1857 Woolner wrote to Mrs. Tennyson:

I was grieved to hear the death of Mr. Barrett, not on the old gentleman's account, but because I know the distress it will occasion to poor Mrs. Browning, who quite worshipped the old man, however unworthy of it he was. He never would be reconciled to her after her marriage, but adopted the somewhat odd plan of hating her for the deed. Poor Mrs. Browning bribed the butler to let her father's dining-room blind remain up a little way that she might obtain one glimpse of him from the street before she started for Florence. She was so weak the poor little creature had to hold on by area rails while she looked her last at her cruel father, then went home and spent the evening in crying.

Another of the old gentleman's whims was not to allow either of his sons to learn any business or profession.

There is a very typical letter from Carlyle (1864) beginning:

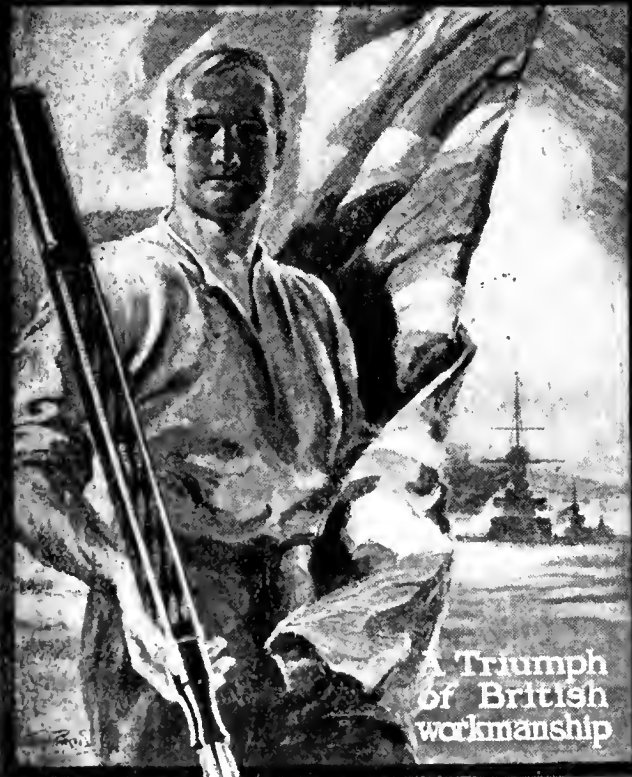

DEAR WOOLNER,—I at once sign and return;—I would even walk in suppliant procession to the Hon. House (if necessary) bareheaded and in sackcloth and ashes, entreating said Hon. Long-eared Assembly to deliver us from that most absurd of all Farce-Tragedies daily played under their supervision.

The House of Commons we have always with us. That some politicians have their feelings is, however, shown in the story about Mr. Gladstone and "Granny" Granville weeping, in unison, over one of Tennyson's *Idylls*. This subject is suitable for the pencil of Mr. Max Beerbohm, as is also that other picture, given in a letter from the present Lord Tennyson (then a child) of The Bard painting a summerhouse. He did it, we are assured, "all by himself." The best story in the book, however, concerns a notability whose name is, unfortunately, not given. He took the sculptor's wife into dinner and almost completely ignored her. After dinner, in the drawing-room, he came up to her and said: "Mrs. Woolner, if I had known who you were I should have paid you more attention." Can it have been Sir Willoughby Patterne?

* * * * *

But what of Woolner? The truth is I have been shirking him. He was evidently the friend of great men and himself a model of all the virtues. He could certainly make good busts and his early portraits of Tennyson—before the poet became a prophet and covered his beautiful mouth and chin with a Pentateuchal beard—are masterly. Some of the best are reproduced in this volume: of Sidgwick and Cardinal Newman no stronger or more informative portraits exist than Woolner's. But busts are one thing. Imaginative sculpture is another. Woolner, with something interesting before him, could see what was there and model what he saw, though he usually began pouting when he was doing a medallion—which he always, irritatingly, called a "med." Genuine creative faculty he had none: no powerful thoughts or passions insisting on expression: nothing more than a taste for the drooping, and a mild affection for the softer virtues. His statues of blind boys, bluecoat boys, Heavenly Welcome, Achilles shouting from the Trenches, Feeding the Hungry, Lady Godiva, and (good Lord!) The Housemaid, are not Pre-Raphaelitism, nor anything else except sheer undiluted, uninspired, smooth, sentimental, degenerate Victorian descendants of Flaxman. Mr. Dombey might have bought any of them in his softer moments, and one is forced to admit that the most interesting thing about Woolner is his diary of two years in the early Australian diggings. It is vividly and vigorously written and, unlike most stories of the sort, it does not conclude its depressing record of failure with the discovery of a nugget as large as a baby's head. Woolner came home richer by nothing save experience, and of that, to all appearances, he made little use.

For the Nursery People

Christmas being a time more especially set apart for the younger generation, no mere grown-up dares to disregard the question of their presents, or treat it with anything but the consideration it merits. There will be lamentations in the nursery world, also, if they don't duly welcome the Christmas idea of a well-known furrier—fascinating sets for dollies in most artistic combinations of velvet and fur.

These adorable little sets are made up from left-over pieces of fur, such as every furrier in the course of the year is bound to accumulate. They include cap, muff and tie, a trio of garments which will enhance tenfold the look of any dollie, and fill the heart of the small owner with pride. Children love these sets as can readily be imagined, and they are selling literally in dozens, so great is the demand for them.

Being sold as soon as they are made, it is difficult to pick out any one set for special mention. Delightful results, however, are gained with all sorts of fascinating coloured velvets; blue, green, grey, brown, mauve being combined with grey, brown or white fur as the case may be, each tiny garment of the set being thoroughly *en suite* with the others.

A little set like this enables a child to play all sorts of alluring games with its doll, and pass many engrossing hours, besides a happy Christmastide. And this big happening can be gained for a little cost, the price varying from 3s. 6d. to 8s. 6d. the complete set, postage being 4d. extra.

Invaluable Leather Undercoats

As the winter goes on the problem of keeping warm is an ever-growing one, especially now when women are engaged on a host of outdoor activities that prior to the war never entered their calculations at all.

One of the methods, of course, is an additional garment of sorts, and amongst the very best propositions of the kind are some sleeveless undercoats. These are really much like glorified waistcoats—only they are fuller and built upon more capacious lines than the stereotyped waistcoats usually are.

These leather undercoats are of the softest most pliable leather, and the warmth they give is considerable. Made as they are, they slip under any coat in the easiest, most simple manner in the world, at once making all the difference in the well-being of the wearer. A belt gathers the fullness together at the waist, two large side pockets bear witness to the fact that in these utilitarian times a woman can hardly be too pocketed, and the whole thing is a masterpiece as far as workmanship is concerned.

The firm in question as a matter of fact, are leather experts, having been mainly responsible for recent developments of leather garments. Owing to ruling conditions leather of all kinds demands—and gets—its price to-day, and these sleeveless coats cannot be bought for a song. They are, however, so entirely reliable and so needed that they are amongst the few things fully warranting their increased price.

The Vogue of the Scarf

This year there is certainly a great liking for neck scarfs, lots of well dressed people wearing them in the country and even claiming a war-indulgence for them in town. And neck scarfs of the super-character a famous London shop is now showing are in very truth *sans égal*, something for which everyone loving pretty things should be duly grateful.

They are artistic to the very last degree, wide, long, warm, soft and infinitely becoming, a long step on from the narrow tape-like affairs with which in times past we have been regaled. To call them neck scarfs is too limiting a term, they are much more of a wrap-scarf than anything else—the very last cry in undeniable charm. With one of these a fair wearer is kept most delightfully warm. A beautiful scarf is much more distinctive than an indifferent fur, besides which there are countless days when for some reason or other one would

rather not wear a fur. Then a scarf of this character appeals as a most commendable substitute.

Some alpaca wool scarves are irresistible in this connection, of such superfine character they are worth every farthing of their twenty-five and sixpence. Softness and lightness itself, yet withal most astoundingly warm, they are in most ordinary as well as some wonderful "art" shades of colour—peach colour, sea blue, lavender and rose.

Use a Shopping Bag.

With notices perfectly rightly asking us as much as possible to be our own parcel carriers, and with Christmas rather more than in the offing, some delightful leather shopping bags appeal. These, indeed, though useful at all times and seasons of the year, are quite invaluable now.

Very light, very commodious, durable and attractive withal, these bags are the precise thing that is wanted. They are really like an open leather satchel, silk lined, and with a good strong handle. Inside all kinds of small parcels can most conveniently go, safe and sound until at last brought home through the bag's good offices.

They are kept in dark blue, green, purple and two shades of red, costing from 13s. 6d. upwards—remarkably cheap, considering the price of leather.

A Boon to Drivers

From all accounts, many a girl motor-driver is finding her work the coldest thing she has done in all her life before, and will be glad to hear that a well-known firm has been specially concerned on her behalf. The result of their reflections is all to the good, for they have introduced slip-on overboots—the most commendable affairs.

These boots slip on like a well-fitting sheath over the ordinary boot and draw up the leg. Here they can be secured below the knee by a strap or over it by a running tape.

A word of praise, however, is certainly due to the maker of these overboots for the excellence of their shape and general design. They are already being hailed with delight by women drivers in all directions, and though they are of necessity not particularly low-priced, it is emphatically better to buy them and keep warm and well than to suffer perfectly needless agonies from the cold by continuing on in the old way.

Cold Weather Corsets

People who really feel the cold will be delighted with some particular corsets so well suited to their needs that they might almost have been designed for their special benefit. These are of tricot, so comfortable and cosy that they are almost like an additional bodice, the difference in warmth between them and the customary type of stay being quite immense, as all their wearers prove.

Apart from these properties their shape is all that can be desired. For war workers they are an ideal stay, since being of the well-liked medium length they give abundant freedom, besides being the very reverse of cumbersome.

They are kept in shell pink and white, the pink ones being the wholly reasonable price of 11s. 9d., the white a few shillings more. Corsets will always gladly be sent on approval by the obliging firm concerned, their name having been a synonym for long years past for the utmost courtesy to customers.

Very few people knowing anything at all about the matter think that cleaning the teeth begins and ends with tooth brush and tooth powder. Something in the nature of a mouth wash is fully as important a detail. Welcome then to Sotol—the mouth wash with a difference. Most mouth washes are liquid, but Sotol is nothing of the kind, being infinitely more convenient for travelling in consequence. It is put up into tiny effervescent tablets, one of which dropped into half a tumbler of moderately warm water promptly dissolves, the most hygienic and refreshing mouth wash being the result. Anyone once using Sotol cannot do without it, its benefits being too prompt and great for that. It keeps the mouth delightfully fresh and clean, with the result that teeth and general health alike improve. Most chemists stock Sotol, forty tablets costing 1s. 6d., or one hundred 2s. 9d., while they can also be got direct from the Western Dental Manufacturing Co., Ltd., 74, Wigmore Street, W.1., post free for 1s. 9d. and 3s. Samples will be sent on receipt of two penny stamps.

NOTEDLY SUCCESSFUL BREECHES-MAKING

We have long been notedly successful in breeches-making, and we maintain this good repute by guaranteeing *all* the essential factors — fine wear-resisting cloths, skilful cutting, careful, honest tailoring-work; and our experience, ninety-six years, is certainly adequate beyond question.

We keep on hand a number of pairs of officers' riding breeches, and are therefore often able to meet immediate requirements, or we can cut and try a pair on the same day and complete the next day, if urgently wanted.

Patterns and Form for self-measurement at request.

TRADITION—

Although the organisation known as the B.S.A. Company is a brilliant example of modern efficiency in manufacturing, yet it is steeped in tradition. Founded on an ideal—the production of the finest rifles in the world—the principles of the founders have been zealously guarded and nurtured in the succeeding generations so that now the whole corporation is saturated and imbued with the maxim—

QUALITY FIRST.

It is not too soon for all sportsmen and rifle enthusiasts to send their names and addresses to ensure the earliest information as to the Company's, post-war productions in

B.S.A. CARBURETTER

A POINT of special interest in the B.S.A. Variable Jet Semi-Automatic Carburetter is the ease with which it lends itself to economical motor cycling. Without dismantling, the rider can alter the jet by a slight turn of the adjusting screw, and regulate the amount of petrol vaporized to suit any condition from walking pace to full power for hill climbing. The B.S.A. Carburetter is of the well-known B.S.A. quality, material and workmanship, and the B.S.A. system of perfect interchangeability is strictly adhered to.

OXO

AT THE FRONT.

Hot OXO is an inestimable boon to the fighting forces at this time of the year.

It takes up little space, is easily carried, and can be converted quickly into a hot nourishing drink which, with bread or biscuits, will sustain for hours.

From France:—

"We are a unit of the 'Old Contemptibles' and so are just embarking on our fourth winter in the field, and I assure you we are very thankful for a cup of hot OXO during the cold wet nights. The winter appears to have set in very early this year out here, and it is extremely wet already, and I am afraid the mud, etc., will be worse than last winter."

From Mesopotamia:—

A correspondent kindly writes us as follows:—

"You may be interested to know that I have been sending OXO to my son in Mesopotamia, and he writes: 'The OXO you sent made many meals worth eating. If you had seen the number of fellows who asked me for some, and whom I had to refuse, you would be inclined to write OXO a stirring testimonial.'"

THE SPIRIT OF VICTORY

SIGNS are not wanting—there is no necessity to go into particulars—that this winter will witness the most critical stage of the Great War. So has it been well named, for it is a great war—the greatest of all wars, for it is not only armies arrayed against armies, but nations against nations, and it will be fought to a finish both through the courage and skill of the fighting men and through the resolution and stern determination of the people. On another page of this issue there appears an admirable article by a distinguished French journalist, M. Coudurier de Chassigne, President of the Foreign Press Association in London, which explains the present spirit of the people of France, their dauntlessness to continue the struggle until definite victory is attained, and their determination not to be "haulted of the end half-won by an instant dole" of peace, negotiated by faint-hearted politicians or by cosmopolitan financiers.

It is always urged by autocracy, that democracy being many-headed and many-stomached, does not possess the nerve and self-abnegation to carry through a long struggle to a finish. If that be true, it would be the death-sentence of democracy. The liberty of the individual on which the Briton prides himself would become a fantastic fraud, and it could only be a matter of years or at most of a generation or two before the old fetters of the Pharaohs and the Babylonian Kings, now represented by the modern irons of the Hohenzollern, were again forged about the limbs of the free peoples of Europe. But is it true? We do not believe so for an instant. Freedom has not been won in England easily; men, generation after generation, have suffered and died for a principle, often when the cause seemed hopeless, but it won through at last.

Nineteen hundred years and more ago a pitiful cry rang out over the roofs of Jerusalem, that sacred city of the East, which only this week has been won back after a thousand years to the higher civilisation, to the nobler humanity that had its birth there in that very hour. It sounded in men's ears as a cry of despair: "My God, my God, why hast thou forsaken me!" As we know to-day it was wrenched by pain and torment from the lips of One who sacrificed everything for the purpose. He had lived on earth to fulfil and by that sacrifice had lifted man to a higher level than he had ever approached before. The occupation of Jerusalem seems to us a splendid omen, one which it would be foolish to ignore. Much as we object to *pro forma* joy-bells, we do believe it has been right to sing Te Deums for the capture of Jerusalem, for that city is the true mother-city of Christian civilisation and of Judaic faith; and let it also be remembered it was esteemed a sacred city by the Arabs, who were animated by a far higher culture—the English language bears testimony to this—than the Turks have ever been, for the Turks among Mahomedan peoples represent, in their brutal and inhuman

qualities, the Germans among Christians.

But to return to Europe and the facts of the moment. We have to face a difficult position both in the firing-line and at home, which needs not merely courage but good sense and a co-operative spirit among all ranks of the nation. President Wilson, in his Address to Congress, rightly defined the enemy "as the German power, a thing without conscience or honour or capacity for covenanted peace which must be crushed and if it be not utterly brought to an end, at least shut out from the friendly intercourse of the nations." Dr. Jacks, in the Christmas number of *LAND & WATER*, demonstrates, on the authority of the German philosopher Kant, that Germany represents bad will and the Allies good will among the nations. And he proceeds: "One would think that good will *ought* to parley, *ought* to try the effect of reasoning with its antagonist before proceeding to extreme measures. But this is utterly impossible from the nature of the case. For the bad will has no reason to reason with. It is sheer unreason, naked and unashamed, so that if you employed reason to bring it round to your point of view, it would not understand one word you were saying." The case against Germany, against her rulers with whom her people seem well content, has never been better phrased; it is that which makes the very idea of negotiations a symptom of weakness. We have only to watch carefully the present German dealings with the Bolsheviks to realise how futile and foolish it is at the present time to employ reason towards Germany.

No living man has beheld this truth more clearly or has given a more distinct and lucid expression to it than Mr. Asquith, a statesman whom we are convinced will be more honoured by posterity than by the present generation whose vision is blinded or distorted by the mists and miasms of party politics. Over three years ago at the Guildhall, in his famous speech in which he declared we shall never sheath the sword until Belgium is free and the military domination of Prussia wholly and finally destroyed, he said, "sooner than be a silent witness, which means in effect a willing accomplice, of this tragic triumph of force over law and of brutality over freedom, I would see this country blotted out of the pages of history." A few months later he declared that we should "fight to the end—to the last farthing of our money, to the last ounce of our strength, to the last drop of our blood." Again a year later and again at the Guildhall, referring to peace, he spoke of "peace, but on one condition only—that the war with its waste and sacrifices, its untold sufferings, its glorious and undying examples of courage and unselfishness, shall not have been in vain." The same resolution, the same note of victory rang through his speech at Leeds last night. "A clean peace! That is what the people of this country and all the Allied peoples desire. And that it may be attained—nothing more but nothing less—they are unflinching in their resolve and in their willingness to go on making the necessary efforts and sacrifices." These sacrifices to-day leave untouched not a single household in the land, and it is for this reason that we have for several weeks urged compulsory rations, to put an end to unevenness of distribution, to stop the painful queues in poor districts and to create in one respect, at all events, a unity of sacrifice.

More than once on Tuesday evening Mr. Asquith referred to Mr. Wilson's Address to Congress, and always with approval. He pointed out that Germany has a right to her own form of Government, and as we have on several previous occasions observed, there is no evidence forthcoming so far that the present military despotism is contrary to the will and desire of the German peoples. They still believe that the Kaiser and his advisers can give them victory, and they continue to accept, on the whole in good part, the heavy sacrifices they are called on to make. Here let us quote Mr. Asquith:

What we of the rest of the world are concerned with is not a people but a system—a system which has used as its instrument first in Prussia, then in the rest of Germany, "that two-handed engine"—the military and the bureaucratic machines carefully and cunningly interlocked. It is that system which has enthroned Force as the sovereign authority; which has held itself at liberty, in the pursuit of its supposed interests, to falsify, to deride, or to supersede (according to the exigencies of the hour) the most solemn pacts, which claims in effect a more than Pontifical power of self-absolution from the engagements and restraints which safeguard the rights of the peoples of the world. This must come to an end.

The Battle of Cambrai

By Hilaire Belloc

THE Battle of Cambrai, up to the moment of writing, has passed through three phases:

(1) On Tuesday, November 20th, the British Third Army under General Byng broke the German front by an action of surprise, including a new tactical use of the tanks, and formed a great salient in front of Cambrai, about four miles deep and some six or seven miles long. Further fighting gave the offensive possession of Bourlon Hill, the continued holding of which would destroy the value of Cambrai as the meeting point of the German communications upon this front. A continued elimination of the nodal point of Cambrai in the enemy's communications would have involved a shifting of his whole line.

(2) After the salient had been more or less stabilised and at points slightly reduced by local enemy action, but with Bourlon Hill still secure in British hands, the enemy, upon Friday, November 30th, attacked with the greatest violence the northern and the southern limbs of the salient with a special effort at their extremities in order to cut off the neck of the salient and encircle and destroy all the forces within it. This plan bid fair to succeed from the fact that the enemy undoubtedly effected a surprise against the southern arm of the salient, at the extremity of which he broke through into the neck of the salient for some thousand yards. But his pressure against the northern arm was met with a determined resistance; his eruption upon the south was partly beaten back; the encircling movement failed. Its result, however, when the very heavy fighting of this main counter-offensive died down, was to leave the salient with a boundary no longer tenable. The enemy had come down between Mœuvres and Bourlon Hill to the neighbourhood of the main road, thus leaving Bourlon Hill itself in a very pronounced, awkward and untenable angle. Masnières, with its crossing of the Scheldt, had been evacuated. The enemy from the top of Bonavis Height at the branch roads, which he securely held, and from La Vacquerie, had observation over all the lower ground to the north. Whence, after a second enemy effort on December 3rd, followed the third phase.

(3) On Tuesday night, the 4th-5th of December, the British line was withdrawn, Bourlon Hill evacuated, and a retirement

begun upon new positions. It appears to have taken up two days, to have been most successfully accomplished, and to have ended on December 6th or 7th upon a much flatter-out-line, which ran from the main Bapaume Road over the height of Flesqueres, and thence apparently straight to Welsh Ridge, then south to points west of Villers-Guislain, and Gauche Wood. The line cannot be accurately described because we have not received anything but a vague account of it. But it seems to be roughly of this nature.

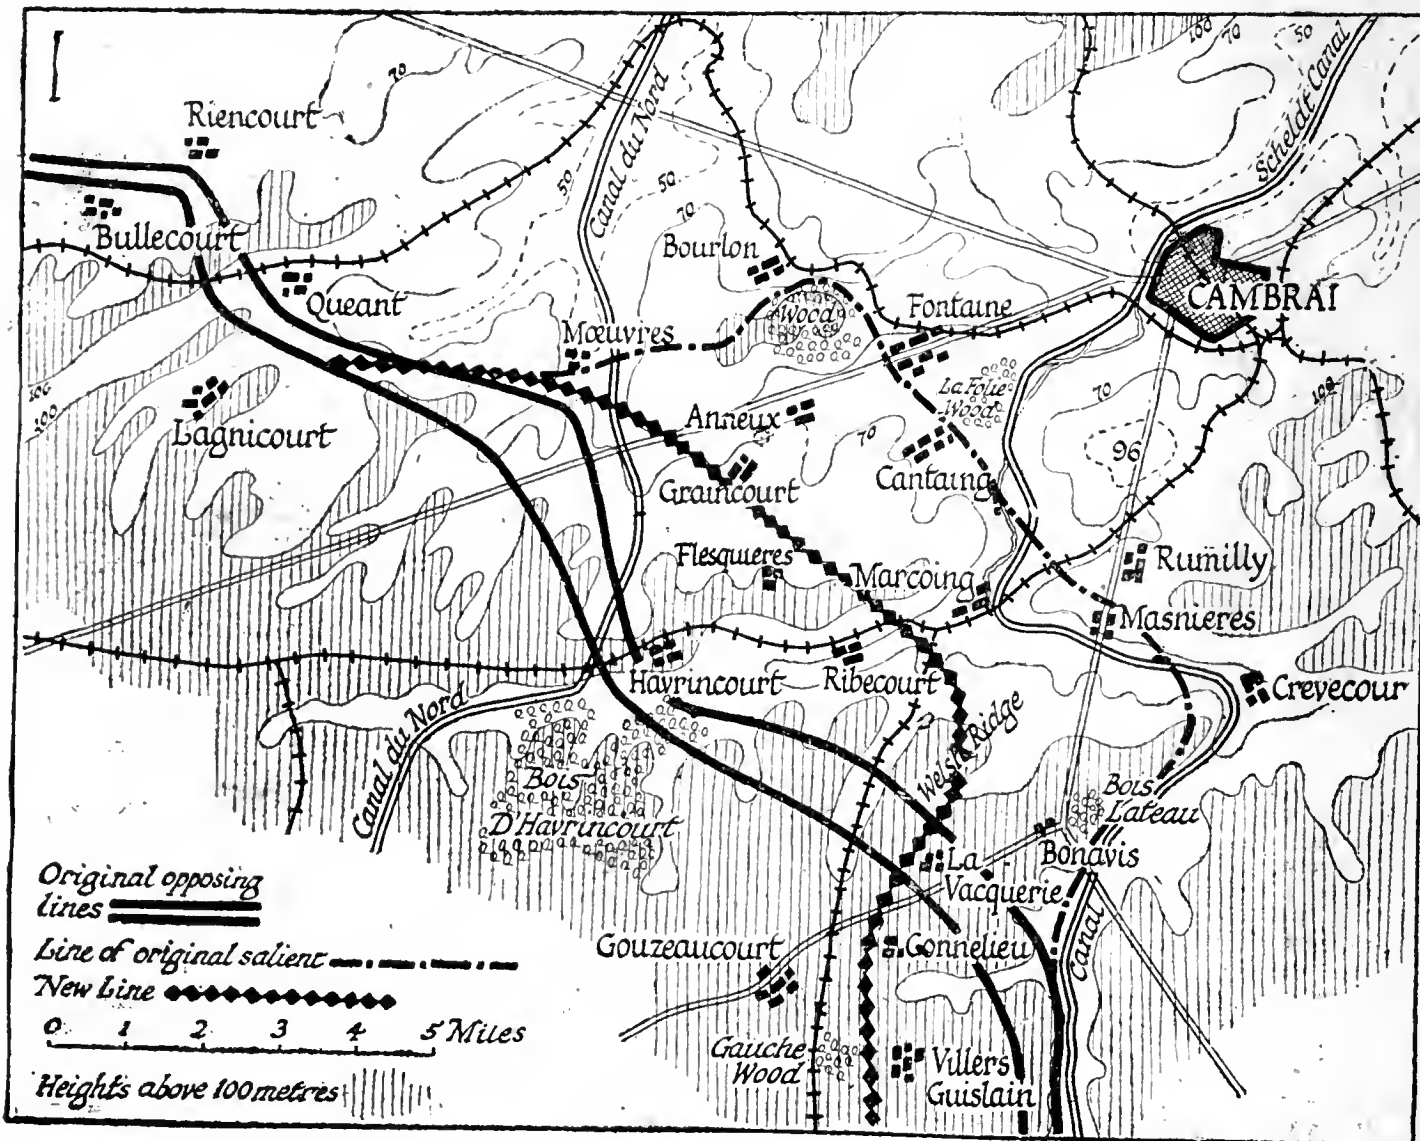

La Vacquerie is still claimed by the Germans, but the last despatches to hand indicate some improvement of our line in this neighbourhood. We are not given sufficient detail upon this to be able to describe it.

It will be seen that the new line has a solid hold upon the heights overlooking the Cambrai hollow. It is obviously strong in position, and its artificial strength must have been greatly consolidated in the last few days, while its trace is too flat to allow of any part of it being taken in reverse.

Meanwhile the value of Cambrai as a centre of communications for the enemy has been restored, and the main end of the original advance is unattained.

* * * * *

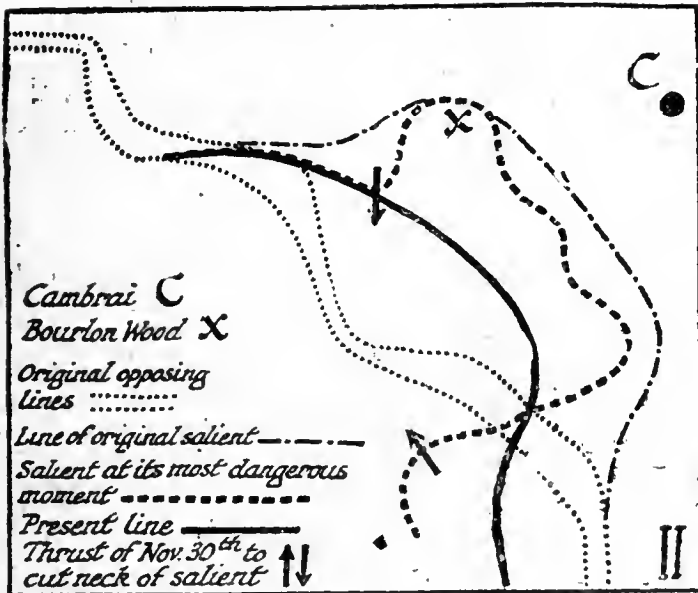

The story, as a whole, is quite clearly one of a superior concentration. It means that against the forces originally employed in the advance of November the 20th and 21st, against the further forces and guns that were thrust into the salient afterwards, and against the successive reinforcements that may have come up to hold the salient against the great counter-attack, the enemy total concentration was superior. He brought in a greater weight of men, and probably a very much greater one. What the proportion was we do not know, because we cannot be told what the total was upon the British side. But we have it estimated that the enemy's attack upon November 30th alone, quite apart from his original divisions which had been standing the first strain before, was made in a force of not less than ten and possibly twelve divisions; while it is probable or certain (for we have as yet no official information upon the matter) that he put in a number more during his second great effort on December 3rd.

Unofficial estimates have suggested as many as 25 German division in action upon this front, and certainly there have been more than 20. Although there was an element of surprise, therefore, upon the southern limb of the salient in the first day of the great counter-offensive, November 30th, the main factor in the German success was the weight of numbers, and this in its turn leads back, as does everything that has happened during the last three months, to the betrayal of the Allied cause by the gang of International Anarchists which has seized power in what was once the capital of Russia.

No serious commentary upon the war can now be of any value that does not make this feature the pivot of all that is to come. The enemy through the latter developments of the Russian Revolution has acquired, for the first time in two years and more, a definite and increasing numerical superiority upon the West.

It is not possible to state, save upon the very broadest lines, what this transformation of the war means, but upon those very broad lines an attempt can be made.

The Eastern front, in its old conditions, accounted for about one-third of the German and about one half of the Austrian forces in men. In artillery we must suppose that the field pieces were heavily diminished in number compared with their concentration upon the West, and we may be certain that most of the heavy pieces were withdrawn during the

summer, for it must have been far more clear to the enemy's Intelligence Departments than it was to general observation in the West that the internal condition of Russia made the transport and accumulation of heavy material by the Russians impossible, apart from the fact that there was but little heavy material to accumulate or to transport. The enemy may be regarded, therefore, as already in possession upon the West of that superiority in heavy guns to which his very large captures in Italy have so considerably added. The immediate future will increase his munitionment for those pieces, but hardly their number. The principal change, therefore, is in numbers of men. Now, so far as these are concerned, we have first the unknown factor of the Russian Civil War. It is clear that the Eastern front cannot be wholly disregarded by the enemy. One may describe it in a general phrase as being "eliminated" in the sense that there has been no pressure there for many months, that over great portions of it an armistice has been concluded; that during the course of a civil war certainly no attack upon the enemy will take place, and that even if the National forces should overcome the Anarchists with their international— or rather anti-national— leadership, it would be a long time before even a local pressure could be exercised. It is none the less incredible that a state of affairs should soon arise in which the enemy shall be able to leave this line completely. What has he to spare from it? It is a mere vague estimate, pretending to nothing more than guess work, if one may suggest sixty divisions or their equivalent as a maximum reservoir of man-power—and Heaven knows that is a great enough weight in the balance! The Germans had, when the movement began, about eighty divisions in the East, and of these eighty perhaps one-half were of material they could safely use for active service against the Western Allies. The Austrians had about half as much again, a larger proportion of which, however, were of good material, partly because it was upon the southern Austrian end of the Eastern line that the greatest danger of new fighting existed, and partly because political considerations demanded special precautions here. If we allow a total of half these numbers, it would seem a reasonable estimate, though over what time such a drain would last and whether it would be carried on to its maximum of exhaustion, only the future can show. Nor do we know how much may not already have appeared against Italy or in France, and consequently what reduced balance may remain.

Beyond these very general considerations there is really nothing to be said. The rest is rhetoric which is worthless, or vivid descriptions of incidents in fighting, which are the functions of eye-witnesses and correspondents, and not of a general survey of the campaign.

The Capture of Jerusalem

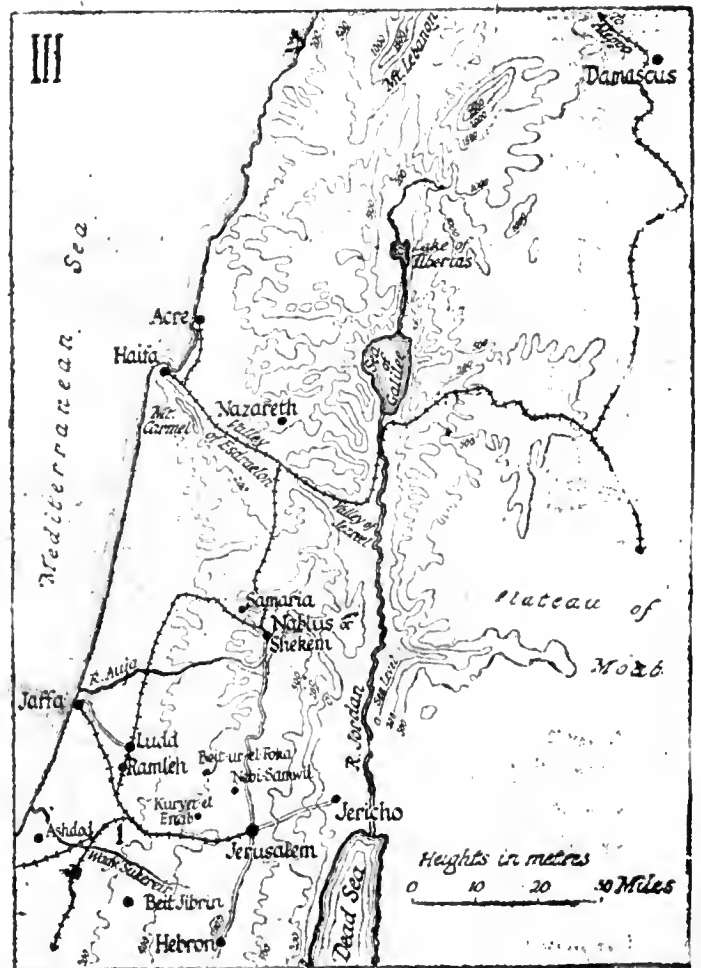

General Allenby's entry into Jerusalem has, even more than most other events of the war, a political aspect sharply divided from its military aspect. The political aspect is sufficiently obvious, and it is comforting to add, sufficiently important. The two towns which, for widely different reasons, stand out in the Eastern imagination as representative of the extended Turkish power, are Baghdad and Jerusalem. Both are now in British hands; and the latter is a symbol of far higher significance than the former, because it appeals not only to the political imagination of men, but to their religious traditions and to the whole of their past. Further, it appeals not only to the Eastern world, but to the whole of Europe.

All, however, that can be said upon this political aspect of the matter has been said in our press and does not strictly concern a commentary upon the military side of the war.

The military aspect of the event is this: After he had lost the railway the enemy held the road leading northward out of Jerusalem to Shechem until he had evacuated his stores, men and guns from the south. It is only subsequent to his evacuation of these southern points, including Jerusalem, that the British force has entered that town; but the success is the fruit of that local decision obtained by the British army on the line Gaza-Beersheba, the consequence of which was that rapid advance all along the sea-plain which gave us the railway, and with the railway the ultimate occupation of Southern Palestine.

We must not forget in this connection that this fine work has reposed upon the excellence of the British engineers. As in the case of the corresponding success in the capture of Baghdad, the foundation of the whole thing has been the supreme excellence of this branch of the British Service, and the reader may mark that when the story of the campaign is written, the way in which supply was rendered possible across the desert and continued up, closely following a large force moving with considerable rapidity, will be the chief part of the story.

It remains to be conjectured where the next Turkish line

will lie, and I would suggest, as I have previously suggested in these columns, the rather obvious line which for centuries has been the road for armies and is to-day an excellent lateral communication—the depression which runs across the Samarian highlands, marked to-day by Shechem, and forming the backbone of the old kingdom of Israel. It might properly be called "the line of Samaria." There is here not only a road, but the railway from Damascus (of which a branch goes to Carmel Bay) forms an excellent avenue of supply, the hill positions in front of which are high and fairly continuous; while it may be presumed that the river Auja, the most considerable stream after the Jordan in the Holy Land, will continue the line to the sea. But in connection with this latter point we must remember that the Turkish flank upon the sea will always be somewhat insecure. The Turks clearly intended twice to rest their flank upon the sea during General Allenby's recent advance up the Philistine plain, and each time were turned, apparently by naval action from outside.

THE ITALIAN FRONT

Upon the Italian front this pressure of superior numbers has also had its effect, just as it has had its effect before Cambrai. There is a group of high peaks making a sort of knot to the north-east of Asiago. Their most important summit was that

of Castel Gomberto. They formed a very acute angle thrust out from the general line, an accident common in mountain warfare, because in that sort of warfare superiority of height is so important that a defensive line takes every advantage it can of crests, even at the risk of holding difficult salients. This awkward projecting angle was reduced by the Austrians in the course of last week in a series of attacks upon the heights which encircle Castel Gomberto. As a result they captured in its entirety the garrison upon it, the enemy claiming as the total of his operations, not only the flattening out of the line, but some 15,000 Italian prisoners. Meanwhile, we are officially informed that British troops are now in line just west of the Piave, upon the height called the Montello, which dominates that stream by about 1,000 feet. The information is necessarily of a very vague kind, and we know nothing of the proportionate strength of the opposing armies upon the critical mountain sector which forms the flank of the Piave line. Everything still depends upon whether that sector holds or no, for if it does not hold the Piave line is turned. Roughly speaking, the Allies are in this mountain sector forced back to the top of the wall overlooking the Plain in its eastern part, while in its western part they are still holding positions from three to seven miles northwards of that edge. The future here depends upon whether this wall can be permanently held or not.

Crisis of the War and the Advent of America

THE two great factors of the war in its present phase are revolutionary in their character and novelty. They are the elimination of the Eastern front on the one hand, and the junction of the United States with the Allies of Western Europe on the other.

The significance of the first factor has been emphasised in LAND & WATER in a fashion only restricted by political necessity. The full truth with regard to it has not yet been told, and certainly could not be exaggerated. It is, as has here been consistently pointed out for a long time past, catastrophic in the true sense of that word, which signifies not a final disaster, but an upturning of all pre-existing conditions. The elimination of the Eastern front through the Russian Revolution gives Prussia and her dependents an active superiority over Western civilisation, that is, France, Great Britain and Italy. It gives the enemy a superiority in men and material. The war ceases to be a siege and becomes a duel. So have things been potentially since the Russian State collapsed nine months ago; so have they been actually since the Revolution destroyed the remaining power of the offensive in the Southern Russian Armies five months ago; so have they been in practice and manifested in example after example since the tremendous blow on the Upper Isonzo now nearly two months old. The Central Powers, on account of active treason to the Alliance by the international gang in the capital of Russia, and on account of the popular passions this gang has played upon, are now in a military sense concerned with Western Europe alone, and Western Europe, immeasurably their superior in value, is their inferior in numbers. That is the position in one phrase. We no longer contain the enemy. We must, upon the contrary, nerve ourselves to withstand a new pressure, the success of which (still more a political truckling to which) would destroy our inheritance. Our Eastern ally has failed us altogether.

But to such a situation there comes in the promised help of the United States. That is, of a polity itself the offspring of western civilisation and inheriting its traditions. This second factor in the situation follows closely and point by point the first. The declaration of adhesion to our cause made by the authorities of the United States comes but a few weeks later than the news of the Russian Revolution. The first appearance of American units, Naval and Military, and the various measures taken by our new Ally to make real its power in aid of us, correspond with the summer collapse of the last Russian effort. The presence of a serious American force under training in France and of its growth from an original nucleus corresponds to the first great active results of the new state of affairs in the West: this autumn and winter—which have seen the tremendous enemy blow against Italy and the enemy concentration in front of Cambrai—have also seen the new American force in training upon European soil for the new tasks of trench warfare, and its rapid and continual increase.

The tremendous changes, therefore, which this war has brought about, presents us now with another and perhaps the last turn of the wheel. The West is definitely united, and has for its sole antagonist Prussia and her dependents. One of the two will conquer. It is a mere substitution of words for things which talks of a "draw" or regards as stable any solution in which an unconquered Prussia shall still remain

in Europe. All the phrases about not desiring to crush the enemy and the rest of it are excuses for surrender. One or the other in the two camps will control not only the material fortunes of the world, but, what is much more important, its spirit in the next generations. And which of the two will do so depends upon the fortunes of that battle line which stretches from the Adriatic to the North Sea, interrupted only by the neutrality of the Swiss Mountains. Upon that battle line civilisation is now upon the defensive so far as Europe is concerned. The United States have come in as a last reserve. Let us appreciate what that effect may be, putting first what must always be provided in any such estimate, the determination to see things exactly as they are and not to follow the always detestable and to-day mortal habit of emotionalism whether it tend to exaltation or to panic. Let us weigh as exactly as we can the advantages for and against both sides.

The enemy, as we have said, has a clear advantage over the Western European Powers in material and in numbers of men. So long as the Eastern front stood he was not only at a disadvantage in both these matters, but he was strategically under a state of siege. He was confined in his fighting to a particular area pounded upon every side. To-day that has gone, and all that is connoted by a state of siege has gone with it.

Let me repeat for perhaps the fiftieth time that the word "siege" and the word "blockade" (in its general: not its technical, legal, maritime sense), have nothing in common except that siege often also permits a blockade, though a blockade can exist without a siege. A siege is, properly speaking, the confinement to a limited area of manoeuvre of a military force. It has certain consequences attached to it, inevitably adverse to the besieged though not necessarily (as history can prove in a hundred cases) leading to their defeat. The chief of these circumstances is the fact that under a siege the process of attrition can be calculated, while the element of surprise is eliminated in as high a degree as is possible. The siege of the Central Empires which could not be raised by relief—for there was no one marching to their aid—has been raised by a political accident, to wit, the dissolution of what was once the Russian State. There is a siege no longer.

The Central Empires now thus massed against the West, and to be massing more and more against it as time proceeds, have another advantage beside the numerical advantage in men and material. They have advantage in communications.

(1) Their communications are wholly by land and therefore rapid and simple, while those of the Western European Powers are largely by sea and therefore slow and complex, involving a few congested points and at least two transshipments.

(2) They are working within an arc of a circle and the Western Powers are working outside the arc of that circle. Therefore, even if the communications of both were entirely by land the advantage in rapidity and concentration would be with the Central Powers.

(3) Their communications being by land and within their lines are invulnerable. Much of our communications being maritime are highly vulnerable and subject to an increasing strain.

The Central Powers have this next advantage in such a duel, their supply of material, especially of coal and iron,

are nearly central to their effort; their three great centres of production (Westphalia, Silesia and Bohemia—to which may still be added the Belgian field) are secure from interruption. The centre of production of the Western Allies on the other hand is, so far as coal is concerned, almost entirely placed in this island, to which much of the iron ore must be imported, and from which supplies must go out to the other Allies, both under the modern risks of maritime communications.

Next, the Western European Allies are dependent upon maritime communications for mere subsistence. Coal for warming and transit must come from Britain; most of her food and raw material must be got into Britain from beyond the sea.

Lastly, the Central Powers have this advantage, that they are all the appanage of Prussia, whereas their opponents are a coalition of equals. Hence the complete unity of command with them, the impossibility of realising it with ourselves. One might digress here to show why the nearest approach to unity of command with the Allies must be of a federative character, and why complete direction under one centre is not only impossible to them, but is a misleading ideal—but the digression would divert attention from the main thesis of this argument.

Such are the elements in favour of the enemy. They are very formidable. That they should be everywhere appreciated is essential to our future conduct of the war.

Enemy Handicaps

Now let us look at the other side. The enemy is blockaded so far as goods from oversea, and especially from the tropics and sub-tropics, is concerned. He is and will long remain grievously handicapped in the matter of lubricants for his machinery, of fats for his food and of such material as india-rubber and of such articles of ordinary consumption as tea and coffee and rice and cotton. He is very short of everything. He lacks wool. He is rationed far more strictly and suffers in daily life far more heavily than his opponents. The statistics of sickness and death among his civilian population are beginning to cause him grave anxiety. He is therefore both on the civilian and on the military side under an exceedingly severe strain which cannot be relieved, and that only in some few departments, for a very long time to come.

Next, he has suffered in men after a fashion comparable to none of the Western Allies, except the French, and even the French losses are not quite as heavy in proportion as his own.

The effect of this point is both moral and material. It has compelled the enemy to draw upon his very youngest lads and to put into the fields boys from a year to a year and a half younger than those used by his opponents. It means that in one way and another there are still great reserves of human material among his opponents which he does not possess, and it means that the moral strain is greater with him than with most of those whom he still has to meet. Great Britain, for instance, has lost in proportion to her numbers, perhaps one-third of what the German Empire has lost in proportion to their numbers. For one woman widowed or orphaned in this country there are under the Hohenzollerns *population for population* three—in actual numbers over five. The strain is of a sort which has never been properly set forth in this country, and the importance of which it is essential to recognise. With equal tenacity and equal will, the margin is here most heavily against the enemy.

Lastly, the enemy has the worst before him or, to put it in another way, the chances of the near future mean for him not an alternative between victory and a difficult defensive—as they do with us—but an alternative between victory and complete disaster. That is a point which the length of the war with its consequent dulling of initiative has obscured. People forget that an invasion of German soil, even a serious disturbance through aerial work of security behind the German lines, would be something novel and productive of an intense strain upon the enemy. The Allies have known such things and have known them if not at their worst, at any rate, as now familiar trials. We have no gauge of the way in which the enemy's social organism would stand similar trials, save our general knowledge of its psychology and the little object-lessons we have had of his panic during the temporary and slight invasion of Eastern Prussia, and of what we know to be the conditions of the few extreme Western towns which have as yet alone suffered from our bombs. The civilians of the Allies have been murdered by scores in their beds and in the course of their peaceable labour. Women and children have been wantonly destroyed by land and drowned at sea. Their civilian sailors have suffered the same fate. Sections of their people have been carried off as slaves, and their buildings, including their most cherished monuments of antiquity, have been wrecked. There have been organised massacres staged

in certain devoted spots and innumerable outrages of every sort less than—if they be less than—murder itself.

Nothing of all this has happened to the enemy, but there stands between him and a just punishment nothing but the strength of his Western line. Put yourself in the shoes of his authorities and ask yourself whether he does not fear the risk of such experiences after a fashion which we, who have passed through them, no longer do.

This summary of the points that are against him at this moment does, it is true, not counter-balance the points immediately in his favour. These weigh heavily upon our regard for the future; we should be foolish to undervalue them, but the truth is that our present tendency is rather, if anything, to over-value them. The great factor remaining in our favour is the advent of America. Let us see what it means.

Of the main numerical proposition no one is ignorant. There is a tendency, precisely because it is so well known, to misread it altogether precisely, though for very different reasons, as the Russian position was misread for a full year after the outbreak of the war. America has a reserve of men which quite overshadows the exhausted forces of Europe. She can certainly take part in this war for two years without approaching the exhaustion even of those specially selected drafts which form so comparatively a small proportion of her total mobilisable power. On the material side she has resources in fuel and minerals and in skilled labour far superior to that of the whole enemy combination, while in the not measurable factor of mechanical inventive capacity and mechanical development, she is the superior of us all.

Further, and perhaps most important of all, she enters the lists quite fresh, for even those of the belligerents who have not lost men upon the scale of the originally mobilised Powers, have suffered the terrible strain of more than three years.

What, then, are the limitations to so formidable an asset upon our side? They are almost entirely contained in the one word "Communications." There was indeed for some months, and will continue for a few months more, the limitation of training—the building up of an army out of very small beginnings—but the more formidable and permanent limitation is the limitation of supply. And supply is a function of communication.

The limitations of an American force to be maintained in Western Europe upon the present line of fighting, proceed from these three things: First, that all the supply whatsoever must be found from the Home base. Not only strictly military supply, but food and indeed everything. Next, that the main communications are maritime; and lastly, that both the main communications and the last stages by land are each in their own kind of great length. The former vary between $2\frac{1}{2}$ and three thousand miles, the latter between 200 and 300 miles. To these general and chief considerations we must add the facts that the Ports of Disembarkation are few and will also require a very considerable expansion of quay-room; that the communications by land after transshipment will also require expansion; that the length of a sea voyage, apart from the numerical disabilities affecting it, weakens men and horses in more than a proportion to its duration, and that the tonnage it requires is also greater in proportion to its duration.

There may be set down in this calculation certain rough rules of thumb which, if they are not strictly accurate, serve well enough for an approximate judgment. Every man maintained by the United States upon French soil means some six tons of shipping to maintain him—this calculated, of course, in gross tonnage, not in tonnage of displacement. Further, of two men thus supported upon the European side, we must not count upon more than one being present in an organised fighting unit upon the immediate front. These two rules of thumb, in our judgment of the position, show us at once how severe are the limitations imposed. Experts differ, and published estimates will differ also as to the number of months in which could be provided—quite apart from the making good of losses—a tonnage sufficient for the maintenance of one million men. It is enough to say that such a force cannot be aimed at until very far into the fighting season of 1918 and more probably towards its close; while in this calculation—which would mean but half a million men organised in fighting units, or say not more than double the German troops actually engaged the other day in front of Cambrai—we are eliminating an unknown factor of loss at sea. We must strictly bind ourselves by these limiting conditions under pain of letting our judgment go wildly astray.

On the other hand, there are factors in our favour which a calculation of this sort does not cover.

The first of these factors is the continual power of replacement enjoyed by our new ally.

Suppose, for the sake of argument, six million tons of shipping available, a corresponding million of men present in Europe with half that number engaged upon the fighting line.

That amount of tonnage presupposes the power not only of maintaining the force statically, but also dynamically, that is, the perpetual stream of recruitment to repair wastage can go on pretty well indefinitely, the reservoir of man-power behind it being, for the purposes of this war, inexhaustible. In other words, though the constant of one million may be maintained, the actual numbers employed throughout a given period served by no more tonnage will be, according to the length of the period, a million and a half or three-quarters or two million and so forth. It is an important point, simple as it is, because when people first hear of the limitations imposed upon American numbers in Europe, they nearly always regard this as a fixed figure independent of the element of time.

The next factor to our advantage is the fact that the advent of the United States gives us (subject again to the power of carrying) an additional material advantage.

Here comes in a criticism which I have often heard made, and which is partially, but only partially, true. Men will say (and the enemy press has been saying it for a long time past) that the material resources of the United States were already at the disposal of the Allies in the shape of a neutral market from which they could draw, and that, therefore, the industrial effort our new ally could make in our favour would not be much more than the same effort which he might have made as a commercial client whose services were obtained by way of exchange and credit.

This criticism is a useful reminder to those who argue as though the Alliance meant in material what it would mean in the case of a doubtful European neutral, and as though forces hitherto refused or husbanded were suddenly let loose upon our side when the United States entered the war. It is not so. A great part of American productive power has been at our disposal for a long time past through our command of the sea. But the opposite idea, that the States entry into war is therefore no new material advantage is subject to two very important modifications. The first is in the word "credit." The Allies have more and more been obtaining material from the United States, not in exchange for existing goods, nor even metal, but in exchange for the promise to produce such goods in the future. In other words, the supplies have more and more depended upon a credit.

Now, there is all the difference between a credit established through the mere play of commerce and the mere degree of confidence or delay, which private firms extend, and the same not only backed by the national government, but fostered by

it, and if necessary, supplemented by it.

The second modification is equally important. The material resources of the United States can and will, now that the Government of the country is in Alliance with us, be co-ordinated for the purposes of war. There can, and will be a common direction, dependent upon a single motive where before there had been no more than the resultant of separate commercial forces. An example of this is the programme of ship-building. You would never have had such a programme and you never could have had it with the United States still neutral.

The last point in our favour is less definite, but to be noted, none the less. It is the advantage which America gives us in what may be called "Special Services," that is, in the factor of brains and mechanical skill as distinguished from mere quantity of production. How far this factor is increased by the fact that the United States is at war is a question which cannot be answered accurately, because there is no way of measuring these moral forces, but it certainly is largely increased. Those elements which do not require very great numbers in comparison with the whole army are now specially at the service of the Allies, and are little hampered by the difficulties of communication. This is true of the Medical Service and numberless other auxiliary elements, and it is partly true of the Air Service, though, of course, the proportion of this to the whole is now-a-days considerable, and the problem of transport enters into it very largely.

We shall not forget, in conclusion (for the popular press has made everybody familiar with it) the exceedingly important element of blockade.

During all the criticism of the Foreign Office, English critics omitted the essential point that the United States was a neutral. This was the great governing difficulty in the whole affair. It was treated patiently and skilfully, and partly, but only partly, overcome by a number of devices each of which in turn tended to provoke friction, and nearly all of which had to be modified after they had been put into practice. But the moment that the neutrality of the United States ceased the nature of the blockade went through a revolution in our favour. It became as nearly as possible absolute, and what every member of our Administration had desired it to be from the beginning. Such, in a brief summary, would seem to be the main points for and against us in this very critical moment when the enemy has found so much new strength through the anarchy in Russia and the Allies are awaiting the development of American aid.

H. BELLOC

M. Malvy and His Judges

By J. Coudurier de Chassigne

FOR a man who loves his country to allege even the possibility that one of his compatriots has betrayed that most sacred thing, *la patrie*, is extremely painful, the more so when the citizen accused of this heinous crime is not only a man of good education and easy circumstances, but also an elected representative of the people in Parliament, and a Minister entrusted in time of war with the safety of the country. Moreover, I am discussing this painful subject in a foreign country, in a foreign paper. In ordinary times I should have declined to do so, but to-day I consider that England and France are one, that during our common struggle against the common foe no distinction should be drawn between us.

This is why I have already written in LAND & WATER what I knew then to be the truth about that great Frenchman and patriot Léon Daudet, at a time when his name was unknown in England and held in contempt and hatred by a great number of his compatriots. To-day I have the melancholy satisfaction of knowing that every word I wrote on his admirable campaign against the traitors who were jeopardising our cause, has been proved true.

But there were other Frenchmen as brave as Léon Daudet, whose leader in Parliament was M. Clémenceau. He it was who on July 22nd denounced at the tribune of the Senate the deplorable attitude of M. Malvy, to whom he said before a full house: "You are betraying the interests of the nation." Léon Daudet went further in *L'Action Française* when he repeatedly called M. Malvy a common traitor, who was bought by the Germans and represented them in the Councils of the Government.

However much I admire Léon Daudet, I cannot bring myself to believe that M. Malvy actually betrayed his country by selling secret documents to the Germans, or by giving them information of a military or a political nature. The word "traitor" means many different things. You can betray your country by being negligent in the fulfilment of your duty as a private or a public man. A Minister, for instance, may surround himself, as M. Malvy is alleged to have done, with unworthy collaborators. Or he may adopt a weak policy

towards anarchists like Sébastien Faure, and destroy, as M. Malvy did according to the same allegations, political documents concerning anarchists in order to win over to his side their benevolent neutrality. This in itself is a crime which will entail for M. Malvy, if these accusations are proved in Court, the heavy penalty of several years' hard labour. But to this last charge M. Malvy will doubtless reply that in so doing he was actuated by political motives, and not by any personal interest. And in invoking the *raison d'Etat*, he would most likely find many parliamentary colleagues ready to absolve him.

At the start M. Malvy's nerveless policy appears to have been fairly successful, but in the long run it became evident that to favour the scum of the population, and to grant excessive facilities to revolutionaries of all descriptions, had merely given the country a fictitious tranquillity. Whatever his object was in doing so, M. Malvy became the protector and friend of Vigo-Almeryda, of Landau, of Paix-Séailles, and of all the pacifist traitors who, with Bolo and his accomplices, did their best to prepare the success of the pro-German manoeuvres which were to pave the way for a premature peace. At the same time, he gave his full confidence to his private secretary Leymarie, whose dealings with Bolo's partners and other German agents have led to his being officially accused of trading and communicating with the enemy. This same Leymarie ought to have been turned out of all official positions, and arrested, as soon as the Minister of the Interior became acquainted with the behaviour of his subordinate in the case of the Duval cheque. M. Malvy not only did not do so, but promoted M. Leymarie to the responsible post of *Directeur de la Sûreté Générale*! And there he remained until under pressure of public opinion he was obliged to relinquish a post which had made him one of the most important wheels in the whole French administrative machinery. I only quote these incidents, and I might, alas, draw up a much longer list, to show the heavy responsibility which M. Malvy incurred as Minister of the Interior since the war began.

Possibly one might find extenuating circumstances in the

origin of M. Malvy and his past career. The son of an unknown *bourgeois* family belonging to Souillac, a small town in the South of France, he had enough private means to come to Paris as a young man and to study for the Bar at the Paris University. But as he had no real need to make money, he was able to spend the better part of his youth in the cafés of the Latin Quarter playing cards, having a merry time, and working as little as possible for his examinations. In those days none of his fellow students ever took him seriously. For us he merely represented one of the most unsympathetic types of Southerner, a shallow sort of a good fellow, what we called *un pilier de brasserie* (a pillar of the public-house), who talked a great deal and accomplished nothing.

One day, when he was still a young man well under thirty, he was elected by his native town as its Member of Parliament. That day he found his real profession. This rapid promotion he owed to his father, who was a well-known politician in his little provincial centre. Thereafter young Malvy did in the Chamber what he had done in the Latin Quarter. Being mediocre and easy going, he quickly made friends in that extraordinary agglomeration of log-rollers which is called the Chamber of Deputies.

It is almost impossible to explain in a few lines that composite assembly which we owe to the democratic regime. Genius, talent, and honesty are to be found there, but they are of little avail against the all-powerful influence of the little coteries of comrades, old and young, who in turn come into power for no definite reason, and with no definite purpose, and who go as easily as they come. This instability of all political combinations in France has been the great curse of the republican regime. We lack large, powerful and well-disciplined parties to insure a minimum of fixity in the tenure of office. And after the war the Republic will have to reorganise its very foundations, and to find a way of putting an end to this perpetual making and unmaking of Governments, if it is to survive and to reconstruct the country so that it may fulfil its new and glorious destinies.

M. Malvy, well-gifted for intrigue if not for serious work, lost no time in attaching himself to one of the coming men of that period. He became the satellite of M. Caillaux, who started, and up to the very end maintained M. Malvy in his career during the past seven years. M. Caillaux it was who obtained for him, before he was thirty-five, his first ministerial post as Under-Secretary of State to the Ministry of Justice in the Monis Cabinet. M. Caillaux it was who has backed his protégé since the start of the war, who has imposed him as his friend and representative upon all the ministries which have lived and died during the last four years.

Ultimately, M. Malvy came to be considered as one of the minor lights of the Radical Socialist party of which M. Caillaux is the brilliant luminary, and which for so many years has dominated the Chamber. This is why all its most influential members are making desperate efforts to avert the catastrophe which will extinguish, let us hope for ever, the stars, great and small, of that party which has assumed so large a share in the responsibility of making this Republic what it is to-day.

However distressing it may be to realise that there exist in my country groups of politicians who, in spite of their loud declarations, put party interest before everything, whenever they dare, I cannot help being proud of belonging to a nation where hypocrisy is of so little account. For a time corrupt legislators may throw dust in the eyes of their electors. This happens everywhere. But with us the comedy does not last very long, for as soon as French public opinion becomes conscious of having been duped, every political and social barrier is overthrown before the violent pressure of the popular demand for fair play and justice. Of course, this method of punishing the culprits openly may produce a bad impression abroad. Foreigners are too apt to remember the Panama scandal, the Dreyfus affair, and to flatter themselves that such things could not happen in their own land. The truth is that one of the greatest qualities of the French nation is that when a cancer is discovered in the body politic, it is drastically treated. I need no other proof that its health is not really undermined, and I only wish all our Allies had the courage to treat their Bolos as bravely and as frankly as we do.

Obviously the Malvy affair reflects no credit on the actual political institutions of our regime. An unbroken period of democratic administration has come to this, that the whole fabric of its power now rests on the shoulders, however strong, of a man of seventy-seven years. If he fails in his tremendous task, things may happen which one hesitates to contemplate, and this situation is sufficient in itself to condemn our present political system. On the credit side there is the French people who have once more saved France, and will always save her. If M. Clémenceau does not represent Parliament, and there is no doubt about that, he stands to-day for the majority of the nation, and he is the Prime

Minister of Public Opinion. He and President Poincaré are backed by the real France, the France of the trenches and the France of those honest citizens who are determined to fight the enemy to the end, as well at the front as behind the lines.

Mode of Procedure

Meanwhile, M. Malvy has to appear before his judges. Had he been an ordinary citizen, he would most likely have prosecuted M. Léon Daudet before a Court of Justice, and submitted his case to a jury. Being a Deputy and enjoying thereby special immunity, he would in this event have had to renounce his privilege in order to meet his opponent on equal grounds. But M. Malvy, though a violent democrat, confesses that he has little faith in the democratic institution of the jury, and his friends agree with him. This is in itself a curious state of mind. Have they forgotten that M. Caillaux found before the war a democratic jury to acquit his wife who had murdered in cold blood M. Gaston Calmette, Editor of the *Figaro*, and his political enemy? However that may be, M. Malvy prefers to appeal to his peers, and as was his right, demands to appear before the Senate, which is the equivalent to the House of Lords sitting in judgment on a case of impeachment.

Here the trouble begins. The French legislators who drafted the Constitutional Laws of the Republic, though they admitted in principle that the President and the Ministers could be impeached by the Chamber of Deputies and were then to be judged by the Senate, forgot to add the procedure to be followed for carrying out paragraph 12 of the Loi Constitutionnelle (July 6th, 1875). By the law of August 10th, 1889, which was in fact prepared specially for the too-famous General Boulanger, everything was carefully settled in view of cases concerning individuals accused of plotting against the State, but nothing was said of Ministers impeached for crimes committed during their tenure of office.

I will not take my readers through the labyrinth of the legal consultations, discussions, and observations which have recently taken place on this subject, the variety of which puzzles even the clearest legal mind. The only thing that interests us is the decision arrived at by the Sovereign Assemblies. M. Malvy having asked the Chamber of Deputies to bring him before the Senate, the Chamber then elected a Commission of 33 members who, by 13 votes, against 4—26 members only being present, and nine including the President abstaining—agreed to submit to the Chamber the following resolution: "*The Chamber decides to impeach M. Malvy, ex-Minister of the Interior.*"

After a long and violent discussion, the Chamber adopted this proposition by 512 votes against two, on Wednesday, November 8th. Meanwhile the Senate was preparing ways and means to cope with the decision of the Chamber, when it should be transmitted to the Higher Assembly by M. Paul Deschanel, as President of the Chamber of Deputies. The first step was taken by a Senator, M. Simonet, who, seconded by M. Monis, ex-Prime Minister, put on the table of the House a Bill establishing the procedure to be followed in cases of impeachment of Ministers before the Senate.

A Commission of 18 Senators was then appointed to discuss this Bill in Committee, and in an incredibly short time it accomplished its work. In a few days the Senate will be able to discuss and adopt the Bill, which will also have to be discussed and adopted by the Lower Chamber. Finally, it will take a few hours for the Government and the President of the Republic to fulfil the necessary formalities for transforming the measure into law, which will be at once applicable to the case of M. Malvy. This done, the Senate will be at liberty to deliberate on, and certainly to accept, the patriotic task which the Chamber has entrusted to it.

Thus before the end of January it is likely that the law of April 10th, 1889, modified in some details, will be applied to the ex-Minister. If this is so, a decree of the President of the Republic will constitute the Senate into a High Court of Justice, which will meet at a definite date.

A magistrate, taken from among the permanent magistrates of the Supreme Court (*Cour de Cassation*), assisted by two *avocats-général*s (whose functions are similar to that of the Attorney General) will on this occasion fulfil the duties of the Solicitor-General (*Procureur-Général*). A Commission of nine senators—who are elected every year at the beginning of the regular session—will play the part of the "*Juge d'Instruction*" (examining magistrate), and after a full enquiry into the crimes imputed to the ex-Minister, this Commission will decide whether there is or there is not valid reason to impeach M. Malvy. In the event of an affirmative decision, the case will come before the full Senate, sitting as a High Court of Justice presided over by the President of the Senate, M. Anton

Dubost. The ordinary sittings will be open to the public, but when it comes to the vote, the High Court sits in camera.

These are the main points of the extraordinary, and at the same time very simple procedure which will in future apply to all cases of treason against the State when the accused occupies the position of President or of Minister. One can

only hope that the High Court, being composed of men of education and standing, may not be swayed, as a popular jury might be, by political passion, and that implacable justice will be meted out to whoever is convicted of having betrayed, for whatever reason, the sacred trust which the nation has, in the greatest crisis of our history, placed in his hands.

Such is the hope and desire of the whole French people.

Merchantmen Engineers

By William McFee

THE mood is on me, and I begin to write. My heart is full and, what is more to the purpose, so is my fountain pen. I am seated in the Engineers' Mess, a nice comfortable, well-upholstered, old-fashioned room about eighteen feet long by ten or twelve wide, with three port-holes open to the breeze of an electric fan sending a delicious artificial gale towards the ceiling where the electric light glows. On the enamelled white walls are instructions what to do when a submarine is sighted, when torpedoed, and so on. I am alone. The chief is in the Ward Room, whither I shall also wend in a short time, to have a drink. I have been nearly two months on a seaplane ship, and find the change agrees with me.

It is Sunday, and I have been working. Oh, yes, there is plenty of work to do in the world, I find, wherever I go. But I cannot help wondering why Fate so often offers me the dirty end of the stick. Here I am, awaiting my commission as an engineer-officer of the R.N.R., and I am in the thick of it day after day. I don't mean, when I say "work," what you mean by work. I don't mean work such as my friend the Censor does, or my friend the N.E.O. does, or my friends and shipmates, the navigating officer, the flying men or the officers of the watch. I mean *work*, hard, sweating, nasty toil, coupled with responsibility. I am not alone. Most ships of the naval auxiliary are the same.

I am anxious for you, a landsman, to grasp this particular fragment of the sorry scheme of things entire, that in no other profession have the officers responsible for the carrying out of the work to toil as do the engineers in merchantmen, in transports, in fleet auxiliaries. You do not expect the major to clear the waste-pipe of his regimental latrines. You do not expect the surgeon to superintend the purging of his bandages. You do not expect the navigators of a ship to paint her hull. You do not expect an architect to make bricks (sometimes without straw). You do not expect the barrister to go and repair the lock on the law courts door, or oil the fans that ventilate the halls of justice. Yet you do, collectively, tolerate a tradition by which the marine engineer has to assist, overlook and very often perform work corresponding precisely to the irrelevant chores mentioned above, which are in other professions relegated to the humblest and roughest of mankind. I blame no one. It is tradition, a most terrible windmill at which to tilt; but I conceive it my duty to set down once at least the peculiar nature of an engineer's destiny. I have had some years of it, and I know what I am talking about.

The point to distinguish is that the engineer not only has the responsibility, but he has, in nine cases out of ten, to do it. He, the officer, must befoul his person and derange his hours of rest and recreation, that others may enjoy. He must be available twenty-four hours a day, seven days a week, at sea or in port. Whether chief or the lowest junior, he must be ready to plunge instantly to the succour of the vilest piece of mechanism on board. When coaling, his lot is easier imagined than described. His department is the last to receive the benefits of modern science as regards tools and equipment. This is entirely due to the mania manufacturers have of insisting on the labour-saving virtues of their products. They always get an extra price by harping on the saving of labour obtained by using their patents. Which means that the unhappy engineer-officers of the ship are provided with another piece of auxiliary mechanism highly complicated, highly efficient (when new) and highly provocative of profanity when it begins to wear, and a depleted engine-room staff have to wrestle with its divagations. The ship-owner, happy in his purchase, reduces his ideal staff still further, or what amounts to the same thing, leaves it as it was ten years ago. He expects his engineer-officers to display loyalty, efficiency, sobriety, industry, tact, authority and many other nameless virtues, the possession of which in any other vocation raise their possessor to dizzy altitudes; raise him, at any rate, above the necessity of plunging into filth at all hours of the day and night.

Yet what alternative can one suggest? This is, as I have said, a tilt at a peculiarly massive windmill, having its foundations on the rock of tradition and cemented with conscientiousness. The genuine blown-in-the-glass engineer *must* see the

thing done himself, *must*, in most cases, do it himself. If he does not, he is haunted by the nightmare of that particular thing falling down on him while on watch. There is this to be said and suggested—his tools could be modernised.

Think for a moment that of all the ships at sea with electric current on tap, scarce one has an electric drill, a mechanism so common in America that everyone is familiar with it. Consider the denseness of intellect which sends ships to sea every day without a single tool specially designed for its work, without an electric torch, or a blow-lamp, or a telephone between bridge and engine-room.

I was privileged recently to inspect the stores and workshop placed on a ship for the use of air-mechanics, and I was astounded. Here was richness! Here were rows upon rows of neatly-made drawers and lockers, lathes, drills, grinders, saws, fans, motors—all the paraphernalia of a modern machine shop. In the same vessel the photographic apparatus and dark room were a miracle of modernity. In the sick bay I found swing cots, fans, porcelain sinks, X-ray apparatus, and every convenience of modern surgery. In the wireless room was a plant that out-marconied Marconi. And down below in the same vessel, the store was a dark and dismal chaos, with a few filthy shelves stocked apparently by an intoxicated tinker.

The tools for keeping the propelling mechanism in order were coeval with Watt and Fulton. With a dynamo of 60-kw. there was not a single electric fan or tool available. And the maddening thing about it all is that tradition makes the competent engineer look askance at modern machine tools. He must make good with the silly old things at his disposal. Here is his intellectual shame and his moral glory. For he *does* make good, in season and out of it, at sea and in port, fair weather and foul. The engines in his charge get there; and he, involved in grease and sweat and nastiness, retires to his primitive bathroom to divest himself of them and restore his bodily presence to a semblance of civilised decency.

Enough of this. As I look round the Ward Room at dinner to-night, I find some other things to think of. There are some engineers, some airmen, some watch-officers; I observe three D.S.O. ribbons. The gentlemen who wear these are neither engineers nor sailors. They are lieutenants R.N.A.S. When I and my shipmates were going through the mill, ploughing the ocean and qualifying for our certificates of competency, these young men were at school. At a bound, after a training of months instead of years, they passed us. We were ready. We were needed. We did not cost the country a single penny to fit us for the vital office of taking a ship to sea and keeping her there. We are sub-lieutenants or less than that. Here I am charging at another windmill!

At the same time, I must admit that a change is coming over the scene. Distinctions are reaching the engine-rooms of battleships and gunboats (*vide* the dispatch on the Tigris operations) so in due course the men who officer the auxiliary vessels of the Fleet and Transport services will some day come into their own.

There is no personal note in this. By virtue of the creative faculty I discover in myself but little liking for the outward trappings of heroism. There is, as a matter of fact, no scrap of the hero in me. I take other ground. An insatiable interest in humanity, cringing, foolish, scared humanity, diverts me from any rational interest in heroes and demi-gods. I find uniform an irksome restraint. I want to meander down Arab streets and talk to private soldiers in their tents and cafés and bars. I want to do a host of things no gentleman ever does! And that brings me to the delicate question, whether the older tradition of being "an officer and a gentleman" is entirely adapted to this war. I don't say for a moment that modern officers are not gentlemen. Only they aren't any more gentlemen for being officers.

I insist on this because I sometimes surreptitiously visit a certain tent which contains a couple of sergeants, both M.A. Oxford. I also meet ostentatiously an officer who was a clerk. Personally, I prefer visiting, if not dwelling in, what one of the sergeants calls the "tents of wickedness." And I'm very much afraid I shall lower myself in the eyes of the uniformed world by going there too often. Here at least is a windmill I can tilt at with some chance of success!

The Old Guard

By Centurion

"Notre armée avait recueilli les invalides de la grande armée et ils mouraient dans nos bras, en nous laissant le souvenir de leurs caractères primitifs et singuliers. Ces hommes nous paraissaient les restes d'une race gigantesque qui s'éteignait homme par homme et pour toujours."—De Vigny.

THIS is a plain tale—the tale of a West-country regiment and how it carried on in the first three months of the war. It is the regiment with a hole in its soup-tureen, but I'll tell that story another day. They went into the first battle of Ypres with four companies; they came out of it at the end of twenty-one days with rather less than two. During those three weeks they never took their boots off, but one of their officers believes he once had a wash.

But I must go back a bit. Their transport cast off her moorings and cleared a certain harbour on August 14th, 1914, at the going down of the sun. The quays were black with crowds who had come to wish them God-speed, but as the ship backed away the drum-fire of cheering which followed them suddenly fell to a dead silence, and the spectators held their breath; the stern of the great ship was within a hair's breadth of crashing into the bows of another. The captain ran to the telegraph. At the same moment a clear tenor voice from among the crowd of men on deck broke into a song; with the second note the whole battalion took it up, singing very softly and in perfect time. The song rolled away from the ship, echoed against the tall warehouses on the quay and died away upon the upper reaches of the river. It was "Tipperary." The crowd listened in silence, hanging upon every note; a woman sobbed hysterically; the waters churned with the thrash of the propeller, and slowly the transport as she answered her helm described a great arc until her bows were pointing towards the open sea. She glided down the river amidst a flutter of handkerchiefs, and the subdued cheers of people who had suddenly grown thoughtful. They watched her in silence as she diminished to the size of a ship's buoy, faded into a wreath of smoke, and finally sank below the red horizon.

Within a week they were at Mons, and on a Sunday afternoon under a blazing sun, they found themselves on the far side of the canal where they put out outposts and dug themselves in. As they watched the white road in front of them, small patrols of men in field-grey uniforms suddenly appeared upon it and, not liking the look of them, scuttled back. At four o'clock a solid mass of the enemy advanced towards a point which the battalion had carefully ranged on—to be precise, it was '500'; the battalion lay very still, each man with his eye on the sights of his rifle and his finger on the trigger, looking back occasionally at the platoon commanders who were standing up behind them, which is a way platoon commanders had in those days. There was a shrill whistle, a crackle of musketry, and amidst spurts of dust the grey mass ahead of them suddenly dissolved like smoke. The remnant of a German battalion fell back in disorder, and told a strange tale of the English "swine-dogs" having massed some hundred machine-guns on a front of a few hundred yards. The enemy believed that story for quite a long time, until they discovered that they were up against the finest marksmen in the world.

After that they were busy, learning many things—among others not to put their heads up, and that this wasn't manœuvres after all. Of the next ten days they have no very clear recollection, except that they lost nearly everything except their wits, their horses and first-line transport having been badly "strafed" at Le Cateau. They beat all records in somnambulism, but when the Germans trod on their toes at Crepy they suddenly showed themselves most disagreeably wide awake. This, I think, was also on a Sunday, and long after that the men would bet any odds every Saturday night on there being quite a big "scrap" the next day.

During those days they led a vagabond life, quite unlike anything they had ever known in barracks. It was very much to the taste of Private John Yeoman, the black sheep of the regiment, whose conduct-sheet covered six pages of flimsy. "No guard room, no orderly room, no morning parade—a bit of allright." Yeoman has succeeded where ambitious men of letters have failed; he has described the Great Retreat in a single sentence.

On the third Sunday at Tournaï they quite forgot themselves on parade when the C.O. read out a Brigade Order, of which they only heard the first three words: "Army is advancing...." The rest, which does not matter, was inaudible, and Yeoman threw his cap into the air. He was always a little premature.

The next thing they knew was that they were picking up

the trail. They followed a hot scent and pungent—the ashes of the enemy's bivouacs were still warm and they stank like dung-heaps. Yeoman, who had often incurred extra fatigues and pack-drill for appearing "dirty on parade," drew the line at offal and broken bottles, and he wondered what kind of enemy it was who could smash a child's toys and throw them into the street. There were other things at which he drew the line; it was near Fère-en-Tardenois, and the mother who had given him a glass of *vin rouge* showed him the body of her little daughter, with whom the Prussians had done their worst. Yeoman was a hard nut, but he wept. He emptied his pockets on to the table and bolted. They had halted there, and this made him late in falling in, for which he got "crimed" to the tune of three days' F.P. No. 1. He did not think it worth while to explain.

During those days they spent most of the time dodging in and out of thick beechwoods and climbing steep chalk cliffs, driving the Germans, who were uncommonly strong on the wing, before them like a line of beaters. They were advanced-guard and had to feel their way, with the result that they got into a very hot corner where they were held up by German wire and badly entangled. It was here that Yeoman lost his pal; having no crape he blacked the second button of his tunic and made certain resolutions, which may account for his getting the D.C.M.—but that comes later. The sun was very hot and the German dead lay where they had fallen some days before; and for the first time he realised the meaning of the words he had as a boy often heard in the parish church, before he fell from grace and went "mouching" on the Sabbath, words about a "corruptible body." He began to associate war with beastly smells. Most of the time he lay very flat on his stomach, clicking his bolt and emptying the magazine; at intervals he heard the order "Cease Fire! Advance," whereupon he advanced in short rushes and again lay on his stomach with his cap on the back of his neck to keep off the sun. He had a most amazing thirst, and sighed often for a pint of bitter. It was at this stage that he realised that the wants of man are really very simple, and although artificially multiplied by civilisation may be reduced to four:—Cover, Drink, Victuals and Sleep; later, in Flanders, he found there was a fifth, which was Warmth. Women he had always regarded as a luxury and unattainable, and on the last sheet of his Pay-book, opposite his M.O.'s certificate that his inoculation was complete, and below the words "IN THE EVENT OF MY DEATH I GIVE THE WHOLE OF MY PROPERTY AND EFFECTS TO....." he had written "Hannah Honey, whom I hereby appoint my next-of-kin," which was magnanimous, seeing that Hannah had refused him thrice. He sometimes wondered whether she knew about his conduct sheet. He did not know that it was Hannah who, recognising the tenor voice when he struck up "Tipperary" on the transport, had sobbed hysterically, for with all his faults, which were many, he was a simple soul and had a very poor opinion of himself which he felt sure was shared by the whole battalion.

He did not know that his C.O.'s sense of values was also undergoing a revision, and that just as Yeoman had discovered that on active service there were only four wants, so his C.O. had discovered there were only four virtues—truthfulness, courage, fortitude and unselfishness. All these Yeoman had, and although he did not know it, there were some who were beginning to take note of the fact.

On the night of September 9th, having run clean out of ammunition, they withdrew three-quarters of a mile, and the platoon sergeant called the roll; there were many who never answered it. Here they learnt for the first time that there had been a big "battle" and, with some astonishment, that they had been in it. The men themselves called it a "scrap"; and as it did not happen to fall on a Sunday they stuck stoutly to the opinion that it was a very minor affair. They were told later that it will be known to future generations as "The Battle of the Marne," but in the battalion it is always referred to as 'the scrap at Montrool.' "The place where I got stopped all them days' pay for losing my pack" gave it the dignity of history in the opinion of John Yeoman.

Up to this time the enemy, being in a hurry, had only got his field-guns in action, and they had encountered little but shrapnel, which, although surprisingly indiscriminate and deadly enough, is nothing like so intimidating as lyddite and much cleaner. Most of the men were under the impression, difficult to explain and hard to eradicate, that big guns were a private affair between opposing batteries; as Yeoman put it, "it bain't 'warfare,'" to use heavy guns against infantry.

He still cherished vague ideas that war was like a football match, and that somewhere in heaven or on earth there was an umpire who saw that the rules were observed, although he was fast coming to the conclusion that the Germans were generally "off-side" and that occasionally they did a "foul." But near M—, after they had crossed the Aisne on portoon rafts, they were undecieved.

It happened about nine o'clock one Tuesday morning, while they were waiting in the village in close formation for our artillery to open fire on a hill which they had been ordered to attack. A "Taube" flew over the heads of the men in the village and just half an hour later the church tower crumpled up suddenly and men were lying on their backs all over the street amid blocks of masonry, a cloud of yellow smoke, and showers of white dust fine as flour. Yeoman, more fortunate, looked round angrily to see who it was had suddenly hit him in the back. He coughed, wiped his nose and thrust his knuckles into his eyes; he saw that he was white as a miller from head to foot. From that time forward he began to associate war with sights no less than smells and equally beastly. Later on in Flanders these assaults on his senses were multiplied; his ear-drums rattled like a tambourine, his eyes smarted as though someone had thrown pepper into them, and his palate tasted the extremes of pineapple and chlorine, which is rather like almonds. Also his tactile sense was offended by lice. All this, however, was to come. The next five minutes gave him a glimpse of hell. The whole village was tumbling to pieces about him, and the streets were a shambles. He heard an order "File out by companies! No doubling!" Each company waited its turn with stolid equanimity. Later in the day on the hill above the village they got their own back. Yeoman was better at making history than at writing it; all he could ever tell you about the "Battle of the Aisne" was "It wur where I got a punch in the back from a German gunner bloke three mile away—hitting below the belt I calls it."

For five days afterwards they led a woodman's life in a forest where they lived in wigwams made of faggots and waterproof sheets. When the shrapnel came whining overhead they made a bolt for their "splinter-proofs," and lay in the burrows for what seemed an interminable time, after which first one head would pop out and then another. The weather was dry, the soil gravel, and the bracken made good bedding; later on, in the wet clay of Flanders, they looked back to those days on the Aisne and idealised them as a blithe pastoral. Here Yeoman set snares and caught rabbits, which rather raised his reputation in the battalion. They got to know the German ways pretty well—first a salvo, then a dead pause for five minutes by way of enticing the unwary out of their holes, and then five or six salvos again. This taught them another lesson, which is that there is such a thing as psychology in war or, as Yeoman put it, "There bain't no vlies on Vritz." One night when they were standing by for an attack, the French put up a "strafe" eight miles away at a place called Soissons, which they knew by its tall crag of a cathedral tower. There was the roar as of a thunderstorm in the air and the sky was one great conflagration so that you could read your watch by it and see the whites of the next man's eyes. At this stage they began to realise that the war was going to be rather a big thing, and that it might not be over by Christmas after all.

The leaves had hardly begun to change colour on the beeches when their trenches were taken over by the French, and they were on the move again for an unknown destination away up North. They did a great trek of 150 miles by way of Abbeville, where they stopped for the night; a journey chiefly memorable to Yeoman for the fact that there he got into trouble for being found by a prowling "red cap" in an estaminet after the hour of 8 p.m. This led to his being "told off." The C.O. asked him if he would take his award, and when Yeoman, who was of an obliging disposition said, "Yes please, sir," as he always did on these judicial occasions, he was astonished to be merely told not to do it again.

"Sorry to disappoint you, my man," said the C.O., with a mysterious smile as Yeoman waited for something more. "By the way, your platoon commander says you showed up well at Montreuil. I suppose you're one of those fellows who are always looking for trouble, and so long as the Germans provide you with it, you're content for the time being." Which was true.

Eleven days after they had left the Aisne they found themselves in a flat country where not a beech was to be seen, but pollarded willows grew thick as nettles. It reminded Yeoman of Sedgemoor, but he had never seen women in wooden shoes with towing-ropes round their waists before. Also the beer was thin as nettle-beer. It was a bad country for artillery observation, and for infantry it was heavy going, for the soil was clay and clung to the soles of your boots like yeast. At Bethune he gave his coat to a Belgian refugee, and got "crimed" for "losing by neglect certain articles of

clothing, to wit one overcoat." It was commonly said of Yeoman, whose father had been a poacher in days when a West-country labourer was expected by the gentry to bring up a family of ten on nine shillings a week, that he did not know the difference between *meum* and *tuum*—which may have been true, for he never could keep anything of his own if he thought others were in need of it. He sometimes "pinched" in the old days when in the society of his pal, but he did this largely from an adventurous appetite for mischief; he never indulged in the meaner form of larceny which is solitary theft. Moreover, since he had seen what the enemy could do, in the way of loot, he had ceased to take any pleasure in being light-fingered; he had a vague feeling that fellows who stole might find themselves doing worse things. Which in its way was an ethical discovery.

On the first day they took up a position facing North, but that night they changed it, and in the morning they found themselves facing the sun. The Division was, as a matter of fact, engaged in wheeling round with its left, swinging on their right as on a pivot while masses of French cavalry were operating on their left flank in an attempt to roll up the German right. It was the beginning of "the great sweep," and their objective was to cut the German line of retreat on Lille. It failed, as everybody knows, and from that moment their long thin line extending away North up to Ypres, was stretched to breaking point, for they had no reserves. They pushed forward and got astride the Estaires-La Bassée road; it was the extreme point of their advance. They were brought up against a wasp's nest of a sugar factory full of machine-guns. They could not see anything to fire at, and they dare not move to dig. The next morning their left company suddenly found themselves between two fires; the Germans had rushed the regiment on their left and driven it in. They knew this from a survivor who, covered with clay from foot to head as though he were a natural feature of the landscape, crawled in a little later. They had just one platoon in hand and this they rushed up. It checked the enemy's advance, who may have mistaken the platoon for a battalion. There was nothing theatrical about the old B.E.F., except that it was always on tour, but in one respect it *was* a stage army. It was always pretending to be bigger than it was.

Yeoman remembered that village as "the place where I lost my blooming pipe," which is all he did remember. He felt rather annoyed about it.

Then came a night which those who survived are not likely to forget.

* * * * *

But at this point I will let Borlase take up the tale. After all, Yeoman was in his company and he knew him better than I did, for Yeoman had poached in Borlase's preserves in the old days before he took the King's shilling, and he had always had hopes of him.

"The enemy made three attacks that night, beginning at seven in the evening and repeating themselves at intervals of about three hours. Their guns were busy all the time, first shrapnel in bursts of six or eight, then H.E. I was kept pretty busy dodging the shrapnel as I had to negotiate that street several times during the night—I was adjutant just then—to get down to the signal office and send messages to Brigade Headquarters. I didn't mind the shrapnel; it was the H.E. that troubled me. You know what a 'strafe' with heavies is like. You seem to be taking a long breath between each shell and you've no sooner ceased wondering where the first is going to burst than you start wondering about the next. Also you feel as if the enemy guns had all got you specially 'registered' and were concentrating on you personally. Which is rather egotistical when you come to think of it. Of course, one gets over that obsession after a time, and you make up your mind that some inscrutable Power has long ago determined that you're either going to get hit or you're not, and that whether you loiter or whether you hustle it'll all be the same in the end.

"The air above us seemed alive with frightened birds—first a flutter, then a scream, and then, as the enemy began to shorten their fuses, we got the shell-bursts right in the middle of the village—followed by a roaring landslide of falling masonry. And all along the line stretching right away up to Ypres the same thing was going on. A brick landed on my foot from nowhere as though thrown by a footpad. I must have looked like a ghost, for my face was running with sweat and the white mortar settling on it formed a sort of plaster-mask. There were hayricks and barns in the village, and as these caught fire one after the other, each rick glowed like a thousand red-hot needles. One patch of the street would be light as day, the next dark as night, and the 'walking cases' rushed the one and then paused to take breath in the other. Their figures made monstrous shadows against the wall as they hurried past. But there was really no cover anywhere, and along our line every man who moved was a mark for a German

ride. Looking down the trench—it was, as a matter of fact only a shallow furrow—you could see a row of gleaming bayonets and occasionally a white face as a man emptied his magazine and fingered his pouch for another clip. There was a most infernal orchestra of sound—machine-guns going like kettle-drums, the buzz, the crack, and the twang of rifle-bullets like stringed instruments, and at quick intervals the tremendous bass of the artillery and the crash and roar of falling houses. The only sound you never heard was a human voice. Odd, isn't it? The more resolute an English soldier is, the more silent he seems to become. The men must have had a raging thirst—you know how dry one's throat gets at these times—they had long ago emptied their water-bottles, and it was impossible for the ration-parties to get up.

"It was in one of these journeys that I met Yeoman. He was coming down from the firing-line, and when I saw him the lower part of his face was covered with blood—he looked just as if he'd cut his throat. As a matter of fact, half his left jaw had been shattered and the bullet must have just missed the jugular vein. I fancy it was a flat-nosed bullet. His left wrist was shattered too. He'd been sent back by his platoon commander. I didn't take much notice of him—there were too many other things to think about.

"I looked in at our First Aid Station, just beyond Battalion Headquarters where the M.O., half-dead with exhaustion, was working by candle-light in overalls amidst a strange smell of blood, iodoform, methylated spirit, and hay. It was a big barn; a row of men were laid out like mummies on the floor awaiting their turn—some had given up waiting!—with the soles of their boots upturned. It's odd how expressive a pair of feet can be—you heard very few cries of pain, but I noticed the boots of more than one man beating together while the rest of his body lay as still as a statue.

"About an hour later I met Yeoman going up to the trenches again, his face swathed in bandages. I asked what on earth he was doing up there, and hadn't the M.O. sent him down to a Casualty Clearing Station. I suppose he thought he was going to get "crimed" again for disobeying a lawful command, and he was horribly apologetic about it. I say horribly because he spoke thickly like a man who's forgotten to put his false teeth back. As a matter of fact all the teeth on the left side of his jaw had been knocked out.

"'Thorry, thir,' he said, 'but I heard we'd no retheryth left.'

"He went back to the firing-line. He was hit twice again that night, but he carried on and only retired with the rest at four in the morning, when we were relieved—not much relief about it—by the K.O.S.B. and went into support. He must have lost a lot of blood.

"In that one day—or rather night—we had four officers killed, eleven wounded and rather more than three hundred N.C.O.'s and men killed, wounded and missing. You know the rest. The long dreary winter near Richebourg. By the time spring came there were just fifty men left in the Battalion of those that embarked on August 14th at Avonmouth. The rest were all new drafts. Yeoman? He got the D.C.M. Also he got a stripe as lance-corporal, and what is much more extraordinary he kept it. Eventually he became platoon-sergeant. His character quite changed—No! it developed. He found himself. Perhaps he'd never really had a fair chance before. He'd had a rough time before he enlisted, poor as a church mouse and as hungry. D'you know, C—, I've come to the conclusion that there's something wrong with our social values in time of peace. We give a brute who kicks his wife a fine with the option of a month's I.H.L., and the man who pinches a pheasant gets three without any option at all. Why is it that the law of England has always been so damned tender to offences against the person and so 'shirty' about offences against property? Why is it that if a man steals a loaf of bread he gets 'crimed,' while if he grinds the faces of the poor by profiteering he gets—well knighted for a subscription to party funds. . . . My men brought nothing into the world and it's quite certain they took nothing out. The nation gave them a shilling a day and valued them accordingly but, my God! they repaid that shilling—paid it with usury. They're all dead. Or else they're maimed and broken for life. And there was a time before the war when not a damned potman would serve 'em in uniform; perhaps it'll be like that again! What is it Kipling says? 'Oh, it's Tommy this and Tommy that, and chuck him out, the brute.' 'Militarism,' you know! I'm not saying that the men hadn't their faults, but you know what a 'New Model' the old Army became after the Boer war. There were very few 'bad hats' in it, and even Yeoman wasn't a bad sort—in fact, he was a damned good sort. You know I often think that there was something wrong with a society which could offer nothing better to chaps like him than twelve shillings a week with rheumatism and the 'Union' at the end of it (unless he reached seventy and got a beggarly five bob) and which could give him nothing better in the long winter evenings than the village tap-room. Perhaps that's why he poached—and enlisted. It always seemed to me that he felt life had never given him what he wanted and had a right to ask, and that he was always looking for something. He found it at last."

"What? Where?"

"On the Menin ridge. A bullet. He died in my arms the same night."

The Beauty of Zeeland Waters—II

By a British Prisoner of War

The writer, a prisoner of war in Holland, was given the opportunity this summer of a cruise through the Zeeland estuaries. The other week he described his experiences up to Middelburg. There he resumes the tale.

ON market days the great square in the centre of Middelburg is lined with stalls and booths, and here all the countryside, is gathered. The *stadhuis*, which dominates this open space, is a grey stone edifice of the most ornate Gothic. There is a forest of pinnacles, and mid-way up the walls statues of the Counts and Countesses of Zeeland and Holland look down gravely from their niches. The high roof is crowned with a bordering of wrought iron and there are rows of dormer windows with bright painted shutters. All the houses in the square are in the formal Dutch style, with curved gables or curious stepped façades. The tall tower of the Nieuwe Kerk throws the shadow of its three hundred feet over the rambling abbey, whose restored fabric is now used as hotel, public library, and province offices. In the paved square that one enters through low archways there are lime trees, which give a certain freshness to the cloistral walls. These walls of red brick are solid and unpierced, and once the abbey was a formidable stronghold.

The impression of stepping back through the centuries is enhanced on Feast days, when all the world wears national costume. This is no artificial revival at the instigation of moneyed sentimentalists, but an unbroken tradition. Older than any building is this dress of heavy black cloth, with the snowy apron and the headdress trimmed with hand-made lace. The jewellery as well as the dress is uniform. There are gold ornaments like a cone spiral spring on the cap, and round the neck are worn collars of garnet or red coral, with a curious gold fastening. The cunning gold work of these clasps is a heritage from Spain, and the industry lives to this

day. Some of the peasants possess trinkets handed down from Spanish sires and treasured with superstitious awe. Middelburg was one of the last cities held for Spain, and in the features and bearing of its citizens, as in some parts of Ireland, there are traces of the Southern strain. There are lurking fires in their dark eyes, and the clear skins of the girls retain a duskiness that contrasts with the transparent pinkness of their countrywomen. Here men and women are fierce and quarrelsome, with a mobility of passion foreign to this slow-blooded nation. In later years they have some shadow of the Spanish dignity of manner.

But the crowning glory of Middelburg is the peal of bells in the great church tower. We noticed their persistent clanging as we walked through the echoing streets, but, like a powerful voice in too close proximity, their tones appeared harsh and overpowering. We sat on deck that night, and from the harbour listened to the long midnight peal. Sadness and a strange, unearthly triumph seemed to mingle in their anthem. For a full five minutes the golden music rose and fell, its message clear and strong and joyous, like the voice of one who knows his words are true. Again and again it died away and then continued, and finally its echo merged with the vibrant booming of the hour. It is in such moments, when we listen to a peal of Flemish bells, or stand beneath the shadow of some French cathedral, that the mightiness of the past seems to shame the boast of modern-progress. Germany has taken the bells from the Flemish towns that she has conquered and melted them for munitions. It is, perhaps, symbolic of Teutonic culture. All the while we could hear, like distant thunder, the noise of guns firing on the Belgian Coast. The sound, low and continuous, was a sinister reminder. Then one was glad that Holland was neutral, that her treasures were safe from German savages.

There could be no greater contrast to Middelburg than Vlissingen. It is naval base, commercial harbour, and

cheap watering place combined; a small scale Portsmouth and Southsea. It has a few dilapidated streets that might be called quaint, but are more dirty than picturesque. There is the usual esplanade, the flash hotels, the grimy cafés, cheerless lodging houses, and behind the sea front streets of featureless villas and grubby shops. Continental visitors lose nothing by passing straight through Flushing. It may have been a fine town once, but its churches, *stadhuis*, and old houses were destroyed by the futile English bombardment in 1809.

We crossed the Honte of Westerschelde, which lies between the island of Walcheren and the strip of Dutch territory on the mainland south of the estuary of the Scheldt. It is open to the North Sea and its waters are never calm, except in the finest weather. The tides are swift and treacherous, and the channels between the sand banks narrow and intricate. After an hour's plunging through a heavy loup we put into a little fishing village on the Mainland. There are disadvantages to Dutch fishing villages. At low tide the oozy mud, polluted with the refuse of the smacks and trawlers, smells unpleasantly, and at night mosquitoes swarm in thousands. The skipper was, however, quite happy. He seemed to enjoy the smell; he had found a distant relation in one of the barges, and the insect plague troubled him not at all.

Off Flushing

We fully expected to find the tide against us all the next day. But our fears were groundless, and early next morning we were under way, tacking towards Terneuzen. A cruiser was steaming up and down off Flushing, her decks cleared, her turrets trained, and the crew invisible, every man at firing quarters. We could hear the steady clink of a small hammer on an anvil, and an occasional pipe, or bugle, or ringing of a bell—familiar warship sounds. At length she started firing; sub-calibre at three fixed targets. The first salvo fell short, but after that it was impossible to judge what shooting she made. We were passing in opposite directions, and soon she was a grey hull in the mist that hung over the distances. The wind dropped, and the sun had driven the few clouds to the horizon where they hovered sullenly, a wall of purple vapour. Flushing, astern of us, grew indistinct. Its roofs and chimneys, the small forest of masts, and the big skeleton cranes, enveloped in mist and smoke, were vague as the distance in a Turner seascape.

There is nothing more delightful than the indolence of a sailing craft on such days. The gentle movement, the temperate warmth of the blue water, and its lazy clack and gurgle against the ship, lull the senses. Books are turned over idly, and after a few pages the most skilful novel can no longer keep its hold. It falls quietly to one side, and dreams, shapeless dreams, of feeling more than thought or vision lay their gently numbing hands upon the brain.

At length, towards noon, a light breeze filled the sails that had been flapping idly in the wind, and we headed for the shore. A shadowy blur of trees and houses and ships was slowly disentangled as we approached, and became a commonplace Dutch harbour, called Terneuzen. We spent the rest of the day there, and found it a featureless little town. It was mildly interesting to two of us interned British officers, for it was here that we had been taken three years before, when we crossed the frontier after the retreat from Antwerp. Someone wanted to send a telegram, and the post office was utterly unchanged since our first visit, even to the grim Raemaekers' poster of a consumptive boy being sounded by a doctor. Terneuzen is prosperous but not bustling, and quite ugly. Over the other side of the harbour we wandered amid the dismantled system of earth ramparts that had once defended the town and guarded the passage of the Scheldt. Now trees were planted on the grass banks, and the water in the silent moats was stagnant and overgrown with weed.

Towards dark, clouds absorbed the whole sky and all the fresh heat of the day turned to oppressiveness. Distant objects seemed distinct and near; the wind had dropped, and a ground swell beat sullenly at set intervals upon the seawall outside the harbour. It was as though the god of storms were consciously reproducing the dictum of a pilotage handbook upon the signs of an approaching cyclone. The disturbance came up slowly, and next morning—again it verified the handbook—there were gusts of wind, a choppy sea and drizzling showers. With one reef in her sails our craft rode gaily through the loup, the spray flying over her deck.

In the afternoon we entered another straight canal, whose entrance was a larger replica of the locks at Walcheren. Then the rain came down in earnest, a soft soaking drizzle that lasts from five to fifty hours. But in Holland there is no lack of rain of every kind; the torrential shower, the wind-blown downpour, and the silent Scottish mist are about equally represented in the course of the four seasons. We lay under the shadow of iron gates, made fast to a granite wall that rose

forty feet above us, and waited for a tow. The landing stage of the little harbour at the end of the canal was filled with barges, for every craft on the Zealand waters had run for shelter. The wind had risen to a gale, and at intervals smashing showers swept over us. The clouds raced across the sky like a multitude of panic-stricken giants. Now and then there was brilliant lightning and the thunder rolled above the bluster of the storm. The barges around us held an angry altercation because one delinquent had announced his intention of sailing next morning and all the others had agreed upon a day in harbour. For the next twenty-four hours the wind was high, but towards evening the clouds were broken. The massive continents of grey had been dispersed and white islands scudded over the ocean of blue.

We explored the village where we lay stormbound. It was a primitive place unknown to tourists and exploiters. We were taken into a room behind a small stationer's shop, paved from floor to ceiling with blue Delft tiles. Many of the oldest and most highly-prized patterns, were rough Biblical pictures. This quaint but crude porcelain is fashionable now, but their owner did not know their value, and furniture and curtains hid many of the best specimens. The whole house was scrupulously clean; clean even for Holland, where the housewives are unremitting in the labour they expend in washing, polishing and dusting. In the kitchen, pots and pans were bright as mirrors, and the table was still damp from scrubbing after the mid-day meal. Out in the scullery the bricks on the sloping floor had been worn uneven by the continual application of soap and sand and water. There was a shelf of old books, but it contained no collectors' gems; only seventeenth and eighteenth century volumes of sermons and theology, including Baxter and other English Puritans, translated into Dutch. The proprietress, a sad-faced woman, showed us her treasures with wan pride. From a heavy walnut cupboard she produced white caps trimmed with old Flemish lace that had been the property of her mother, and native jewellery of gold with drop pearls. One feared the invasion of the antique dealer and his shrewd bargaining with these peasants.

Even in these forgotten villages the old national costume is falling into disuse. So strong is the cloth that dresses are handed down from mother to daughter, but new ones are seldom made. Cheap drapers, with their ugly fripperies are enterprising, and their false lace and ribbons and jewellery exercise here, as everywhere, an unholy fascination.

The gale finally blew itself out that night, and we started as early next morning as the tide allowed us. There was the familiar freshness after a storm, the air cool, a steady breeze, and a few drifting clouds. A fleet of various craft was under way after the enforced imprisonment. Stout tugs had in tow long hulks laden with coal or hay or gravel, and there were numberless sailing barges with green or black sides. Traffic was brisk, though we were far from any of the main arteries; but nearly all transport in Holland is by water, and every tiny township, however far inland, is a port with barges always lying at its quay.

We skirted a long sandbank and stood out towards Zierikzee, a little fishing town that at that time had temporarily emerged from obscurity through being accidentally bombed by an English aviator. We did not stop there, but spent the next two days tacking through these inland waters on our way back to Dordrecht. How familiar grew that never-changing line of shore, grey and jagged against the sky: Often it appeared almost transparent, shadowy and unreal as clouds. There is a dreaminess, a sense, as in the East, of ancient things still undisturbed in these towns and villages. Barges sail in and out of the little harbours bringing all that is wanted from the outside world, and life goes on placidly, without competition or hurry. On the water the bargemen neither race each other nor exchange amenities after the custom of English watermen. They are a blasé, weather-beaten race, dour and impassive. Their women folk, who take their turn at the wheel and assist in all the work of the ship, are brown and angular. It is a people apart, a tribe of law-abiding water gypsies. The painted cabins of the barges are reminiscent of the interior of a caravan.

At nightfall we put into a neat but dingy state harbour, with a railway station and a quay from which a small steamboat made its four-mile journey to Willemstad. Beyond a great meadow, interlaced with broad ditches, we could see amid a bank of poplars the roofs and chimneys of a large village.

There was a final day beating down the Hollandsche Diep towards the Dorde Kil; a day of basking in the sun almost wishing that time might stop, leaving us for ever in the pleasant backwater where the peasants hardly realise a war is raging.

The boat slipped steadily eastward, and presently the long Moordijk bridge, with its fourteen spans, loomed in sight. More distinct it grew, and at last our helm went down and we headed for the narrow waters of the Dordrecht canal.

The Best of all the
Christmas Numbers
is
LAND & WATER

IT CONTAINS Poems, Articles, Stories and Pictures by Thirty of the Leading Writers and Artists of the day. There is a **Poem by Rudyard Kipling**, entitled: "**The Holy War**," with a decorative border by Edmund J. Sullivan. **An Historical Essay, "The Triumph of Saladin,"** by Hilaire Belloc; Christmas and the Pedants by G. K. Chesterton; "The Ballad of Ensign Joy," by E. W. Hornung; "The Soul Box," a wonderful story by Jan Gordon; The Poetic Revival by J. C. Squire; The Ferment of War in Art, by Charles Marriott; "The Powers of Darkness," by Centurion; and Articles by Jason, Alice Gregory, L. P. Jacks, Sir Herbert Matthews and others. OXFORD BROAD STREET

Life and Letters

By J. C. Squire

Thomas Hardy's Verse

MR. THOMAS HARDY, in his old age, is devoting himself exclusively to that art of poetry which he dallied throughout his active life as a novelist. His later poems have been enormously finer than his earlier, and there are some of us who incline to think them even more certainly durable than his novels. They have their great limitation, as one will presently suggest, but they are extraordinarily powerful, original in language, rhythm and shape, and amazing as the work of an old man. *Moments of Vision* (Macmillan, 6s. net) contains the latest of them, and there seems every probability of Mr. Hardy adding to them as long as he lives.

* * * * *

Mr. Hardy's poems fall into two broad classes: the narrative and the non-narrative, though poems of the first class frequently contain a reflective element and the others an element of dramatic reminiscence. Almost all his finest poems belong to the second class; and the best of all are those intensely moving lyrics, one group of which appeared in his last book and of which a second series is now printed, written in the last few years under the pressure of a personal grief. The narrative poems are almost always tragic, and they are marred (as some of his prose stories, including *Tess*, are marred) by his determination to lay the gloom on as thick as he can. His *Satires of Circumstance*, in which a number of preposterously grim situations and plots were compressed into a few lines each, invited, and were accorded, the attention of parody, and all his books of verse contain examples in this kind. They often move more to laughter than to tears—so grotesque is the persistent ferocity with which he arranges that his characters shall get it in the neck from fate. There is only one bad example of this in the new book. The story that Mr Hardy's extraordinary brain has constructed concerns a marquis and his wife, who have secured "Royal Sponsors" for their baby:

The morning came. To the park of the peer
The royal couple bore;
And the font was filled with the Jordan water,
And the household awaited their guests before
The carpeted door.

But when they went to the silk-lined cot
The child was found to have died,
"What's now to be done? We can disappoint not
The King and Queen!" the family cried
With eyes spread wide.

Even now they approach the chestnut-drive!
The service must be read.
"Well, since we can't christen the child alive,
By God we shall have to christen him dead!"
The Marquis said.

This these extremely loyal subjects do, and the royal couple depart from "the park of the peer" without knowing what has been done! One need scarcely bother to point out that the hopelessness of the subject has drawn Mr. Hardy into worse writing than he usually perpetrates. The first two lines are thoroughly comic.

* * * * *

The other poems are a different matter. This book is not, as a whole, as good as Mr. Hardy's last; there is nothing in it equal to, for instance, *The Voice of the Past*, one of the most perfect songs a living poet has written. But it is intensely interesting, and often moving. One mood dominates it all: that of regret for the past, for old happiness and old enjoyment, for one figure loved and lost, or for "the bevy now underground." Allowing his irony and his bleak fatalistic philosophy only an occasional peep in, he sits and broods in his old age over things that have gone, and draws music from that sensitive heart of his that no rationalising has ever been able to petrify. Wherever he starts from he reaches the same goal; any small thing is a key which opens the chamber of his sorrows. The log slowly charring in the fire comes from the tree which he climbed and she stood under years ago; the skeleton ribs of a sunshade found under a cliff was left there by a woman now dead. He burns a photograph of someone, not a particular friend, and the eyes of the reproachful dead watch him from the air; a moth beating at his window may be the forlorn spirit of the dead; a pedigree that he is studying springs to life before him, and he meditates over all the departed generations whose blood is in his veins; he starts out on a familiar road to pay calls and re-

members that all those he used to call on are gone. Everything is behind him and nothing before him; he watches with resignation and melancholy the changes of his own flesh just as he watches the decay of an old ruined house where the liddles once played and rustic feet twined in the forgotten country dances. Time after time he writes what is virtually the same poem, but the constant freshness and poignancy of his feeling makes it always new. *The Anniversary* is characteristic:

It was at the very date to which we have come,
In the month of the matching name,
When, at a late minute, the sun had upswum,
Its couch-time at night being the same,
And the same path stretched here that people now follow,
And the same stile crossed their way,
And beyond the same green hillock and hollow
The same horizon lay;
And the same man passes now hereby who passed thereby
That day.

Let so much be said of the date-day's sameness—
But the tree that neighbours the track,
And stoops like a pedlar afflicted with lameness,
Had no waterlogged wound or wind-crack,
And the stones of that wall were not enshrouded
With mosses of many tones,
And the garth up afar was not overcrowded
With a multitude of white stones,
And the man's eyes then were not so sunk that you saw
The socket-bones.

It will be observed that there are several awkwardnesses of phraseology here. Mr. Hardy bristles with them. In a spring poem he even says, "The primrose pants in its heedless push," and in a search for a rhyme he will embellish a modern and simple lyric with "a maid and her wight." But the odd thing is that we will accept from him words and phrases that would seriously damage anyone else, and that sounds which from any one else would be sheer cacophonies are, in Mr. Hardy, as it were, overborne and absorbed by the compelling music of his emotion. It may be monotonous, but it is scarcely ever anything but genuine and strong.

* * * * *

His monotony is his weakness. He can soften one's bones with his lamentations, wring one's heart with his regrets. He can vary his interest a great deal by the accuracy with which he describes the landscapes and people that pass through his mournful chants. But a major poet has more moods than one. It is characteristic of Mr. Hardy that only the landscapes of his past are ever sunny; when he is writing in the present tense the chances are a hundred to one that it will be raining hard, on window-pane and bereaved tree, and there is quite a strong probability that he will actually find himself in a churchyard where the natural inclemency of the weather is reinforced by the rain-worn cherubs on the tombstones, the half-effaced names, the dripping moss and the direct reminders of the dead. It is a welcome change when he makes the admission that even a life like this is worth having, as in this:

To travel as a phantom now,
For people do not wish to see
In flesh and blood so bare a bough
As Nature makes of me.

And thus I visit bodiless
Strange gloomy households often at odds,
And wonder if Man's consciousness
Was a mistake of God's.

And next I meet you, and I pause,
And think that if mistake it were,
As some have said, O then it was
One that I well can bear!

And twice he goes so far as to hanker after a belief that is not his and of which he perceives the inaccessible loveliness and sweetness. On a Christmas Eve, at midnight, someone mentions the legend about the oxen kneeling in the stall, and he feels:

If some one said on Christmas Eve,
"Come; see the oxen kneel
In the lonely-barton by yonder coomb,
Our childhood used to know,"
I should go with him in the gloom,
Hoping it might be so.

But these are exceptions, and Mr. Hardy, as a poet, must be described as one who had he been less strong, could not have escaped the appellation of "morbid."

Books of the Week

Last Words on Great Issues. By J. BEATTIE CROZIER. L.L.D. Chapman & Hall. 10s. 6d. net.

The Complete Despatches of Lord French, 1914-1916. Chapman and Hall, Ltd. 21s. net.

A German Deserter's War Experience. Grant Richards. 5s. net.

Vae Victis. By ANNIE VIVANTI CHARTRES. Edward Arnold. 6s. net.

World Without End! By W. E. CRISP. J. M. Ouseley and Son. 6s.

HERE are a collection of essays which will delight the thoughtful reader. Already, before the war Dr. Crozier mentions that signs were discernible that materialism was on the wane, and the scientific explanation of life and the causes of life, of which Darwin and Herbert Spencer were the chief prophets, was no longer finding general acceptance.

And now what do we find to-day? Spencer's philosophy is said to be dead, great as was its colossal superstructure, and its real power; and yet, in my judgment, there is scarcely a division of it in which he cannot give all of us "points" even yet. Darwin's basis has been superseded in turn by the once despised Butler; and as for the academical dons who in the old days listened to the lightest whispers from Germany as if they were oracles, they are now seen flying from them as from a pestilence, and, like St. Peter, denying that they had ever known them. The old academical political economy, too, which entrenches itself on the free trade principles of John Stuart Mill and Marshall, has not only been suspended during the war, but, in my judgment, has gone, never to return—until the conditions, summarised in the article in these "Last Words," are realised.

"Last Words," we take it, is not to be accepted too seriously, for Dr. Crozier still writes with all the vigour and brightness of youth. His trouncing of Mr. Wells and Mr. Wells's theological writings is as good sport as we have come across on a printed page for a long time. Nor does he spare Sir Oliver Lodge for his excursions into spiritualism. On both these popular subjects he brings rare common sense and consummate irony to bear, never lacks courage, and his thrusts strike home. Imperial questions also interest him; there is an essay on the Canadian tariff, which, though controversial, is filled with important facts. *The Government of India Problem* was written just after the Delhi Durbar, and is an acute comparison between the Roman Empire and the British Empire as exemplified in our dominion over India.

* * * * *

When the war is over, and official and other histories of the war are being prepared, much consideration will be given to the contents of the books, but probably little to the form. This important matter has received evident attention in this volume of Lord French's Despatches, and the result is a book that can be handled and read with pleasure. The type, paper, size and binding are altogether excellent, and form a model that others will be wise to follow.

The book contains the Complete Despatches and the names of all those "mentioned," also many excellent maps and portraits. The despatches themselves give the wonderful record of "French's Contemptible little army," and tell in the simple and straightforward language of the Commander-in-Chief the finest story of British arms. Reading these despatches again in the light of recent knowledge, one is filled with astonishment and admiration for the greatness of the achievement. It is a story that will live for ever, and it is well that it has been produced in such an excellent manner. The edition is limited to five hundred copies, which seems a pity, as there are sure to be many thousands who will want the book both for its military, historic and personal value.

* * * * *

According to an unsigned preface the author of *A German Deserter's War Experience* escaped from Germany and military service after fourteen months of fighting in France; he is said to be an intelligent young miner. The book itself deals with the first advance into Belgium and France, the battle of the Marne and the trench warfare that succeeded it. Many passages are singularly reminiscent of Stephen Crane's book, *The Red Badge of Courage*. There is little in it that might not have been written by any soldier in any war except that now and again we come across passages like the following: "I

am feeling convinced of how little the soldiers can be held responsible for the brutalities which all of them commit, to whatever nation they belong. They are no longer civilised human beings, they are simply bloodthirsty brutes, for otherwise they would be bad, very bad soldiers." This is, of course, a specious falsehood, but Germany has been endeavouring for some months past to use this very plea as an excuse for the State policy of "frightfulness," seeing that "frightfulness" failed to accomplish its purpose. The hideous atrocities of the German Army from the early months of the war have been almost excelled by the cold-blooded brutalities and abominations of the German military authorities in the later period, so that this excuse carries no weight. But it is curious to find it so strongly expressed in this German deserter's book. The writer gets leave, obtains civil clothes, and after risks manages to get across the Dutch frontier, finally finding his way to America as a stowaway on a passenger steamer. He ends by saying that he has entered the ranks of American Socialism, to extirpate capital. It would be interesting to know what he has been doing in the land of his adoption since the United States entered the war.

* * * * *

Vae Victis, by Annie Vivanti Chartres, is the story of two women of eastern Belgium and of a little girl, daughter of one of the women. It is the story, too, of the first German thrust toward Liège, and thus a story of outrage and rapine. As a novel, it is altogether too horrible, although the author has lightened it as much as possible; as a tract, that men and women of this country may realise and remember what Germans did in Belgium, it is a very valuable piece of work, and one for which its writer deserves hearty thanks. For the long series of outrages against all law that have followed on the initial crime of Belgium, although they have not sufficed to cover the fact that Germany put necessity above the law of humanity at the outset, have, to a certain extent, blunted our realisation of all that Belgium gave in defence of honour. Here, in the fate of one family, is an epitome of the cost of the Belgian defiance of Germany, a record by which we may realise how much was taken from those people who once lived beyond and about Liège, for many of whom—old and young alike—life ended in the first week of August, 1914. It may be urged that this story is not true, and in the strictest sense of the word that may be so, but that facts to parallel the story can be found is equally true. Considering it purely as a novel, it is very dramatic work—but we prefer to consider it as a book that should be produced wherever a pacifist dare to raise his voice, for it would be difficult to find a better antidote to the efforts toward a German peace.

* * * * *

There are over six hundred pages in *World Without End*, by W. E. Crisp; if there had been about half as many the story would probably have been far more convincing. The author is concerned mainly with elementary spiritualism, and with the fact that the essential ego can never really know itself in this life, since its true perceptions are clouded by the purely human desires that arise from occupation of an earthly body. It is a present-day story, dealing with the iniquity of Germany, and not devoid of a good deal of dramatic incident, though undue diffuseness rather militates against the effects of otherwise striking scenes.

One very good point that the author makes is the way in which the Scandinavian nations stood by and watched, knowing full well the enormity of the German crime. Yet, for their own safety, the Scandinavian nations could have done little else. Mr. Crisp, however, is not concerned with expediencies, but with straightforward rights and wrongs, and one thing to be said for his book is that it takes the reader right out from twentieth-century materialism, in which profit and loss count for more than anything else, to the land of dreamers who put ideals first—the book is not life as it is, but life as it ought to be. This view is expressed through purely material happenings; although the author deals with spiritualistic phenomena, he does it fairly sanely and without undue stress.

The main fault of the work is the pressing need for condensation, and understanding of the fact that trifles only count when they are relevant to character development or plot development. The publishers emphasise the fact that this is a "full-dress novel": We would that some of the superfluous clothing had been removed before the manuscript went to the printer, and, with that for cavilling, willingly acknowledge the high motive which animated the writer in his work.

Waterproof Writing Cases Nothing is more prized by friends and relations at home than letters from men at the Front, and few things will better enable these to be written than some capital waterproof writing cases. Through these rain simply cannot penetrate, so that no matter how wet a man may get, his writing materials remain dry.

The cases are of convenient shape, going into any reasonably sized pocket, and each is fitted with a lead pencil as well as a supply of writing paper. When the writing paper is finished, or if it is not up to individual requirements, it can easily be replaced by some writing materials of some other quality—as can be imagined, it is the case that is the thing, not the easily changeable contents.

Better grade waterproof stationery wallets cost 1s. 11d., by no means a ruinous proposition. Inexpensive though they are, however, there are others even cheaper, these costing one shilling each or 11s. 6d. for a round dozen. Some generously minded ladies have been buying these wallets in dozens to send to men of their husband's company or battery, and the idea is a good one, this sort of present never being particularly easy to find at any time.

War Workers' Aprons Since winter brings in its train more opportunity for war-time sewing, some war workers' aprons are bound to meet with all the success they deserve—this, let it be said, is no little matter. These aprons are specially designed to hold needles, cottons, thread, scissors, knitting needles, wool, and anything else in the same scale of impedimenta.

This is arranged by the capacious pocket going in kangaroo fashion across the front. Any amount of room here to store all sorts of things, preventing thereby the annoying way all such articles have of hiding themselves if they are given so much as half a chance. Apart from this too, the apron guards the wearer's frock from harm, being a practical affair with a bib, and not by any means one of those fly-away affairs hardly meriting the title of apron at all.

The aprons in question are more fascinating than words can say. Though their main object is utility, they are decorative into the bargain, a combination by no manner of means as common as it might be. A fascinating example is in grey and white duster check, with old gold linen borders, yet another seems covered with roses, a rose-coloured cretonne having rose-coloured hem, bordered pockets and bib.

It is difficult to pick out any particular apron for mentioning owing to the possibility that it may be sold by the time these words appear in print. Others equally charming, however, will have undoubtedly taken its place.

Gaiter Over-Boots Any amount of praise is due to some gaiter over-boots, and women everywhere are enthusiastically giving it, nothing else in this particular way so fully meeting their needs. These over-boots, to all intents and purposes, are much like the invaluable "gums" we used to wear in days gone by in Switzerland. They slipped over a light shoe in the way these over-boots do, there being little to choose between them in point of view of look.

And just in the same way, these gaiter over-boots protect their wearer from hail, sleet and snow with all the gain to comfort such protection means. Warworkers in the canteens in France and elsewhere have long claimed these over-boots as their own, and benefited accordingly. They are waterproof—an additional and strong point in their favour, and do up in the true snow-boot fashion, fastening across the front with something strong in the way of a clip.

The price is 16s. 6d., and they can be bought of correct size without any more bother than the sending of an old shoe or its tracing on a piece of paper, should a personal visit for

some cause or another be out of the question. The next supply of these over-boots being uncertain, those now in stock should be secured while yet there is time.

Cloth Stoles and Muffs Realising that not many people these days have a surplus stock of furs, and that even if they have, there are some days when furs are not suitable, a clever firm have brought out some delightful sets in various coloured satin cloth.

They are beautifully made and lined, and exceptionally warm, in this way quite rivalling fur. The stole, crossing over in pretty cosy fashion, has a fringed cloth end, aiming at a finish it quite certainly imparts, while the muff is not one whit behind in attraction, having a kind of plaited thong at either end, tassel-finished and all that a well conducted muff should be. This, like the scarf, is lined with ruched silk, no detail being omitted to enhance still further its charm.

The price for the set complete is three and a half guineas—a price at which anything in the nature of good fur naturally enough is unattainable now-a-days. These muffs and stoles of first-rate quality cloth, then, have their very particular claim to our regard, and it is worth knowing they can be had in black, white, grey, powder blue and tan.

Esprit de Liège The patriotically minded will rejoice in Esprit de Liège, the best substitute for Eau-de-Cologne. As a perfume it is of surpassing virtue. Made from a carefully prepared formula in which synthetics have no part, it is welcome as the flowers in May and equally refreshing.

Synthetics, it may be explained, are the chemical products which, though they may not be apparent at the time in perfumes containing them, become very much so as soon as the first fragrance fades away. Their elimination from Esprit de Liège makes this a lasting perfume, as fresh at the end as it is at first, and hence trebly inviting.

Esprit de Liège is much appreciated in hospitals, many a wounded man having benefited through the freshness and fragrance it brings in its train. As a toilet water too, it is quite unbeatable, just a few drops reviving the face and hands, besides keeping them from getting flushed or rough.

As a Christmas present Esprit de Liège excels, and an inexpensive gift it is into the bargain, bottles costing 1s. 9d., 2s. 6d., 5s. and 10s. 6d., according to size, or three good sized bottles in a box working out at 7s. 6d. the lot.

Who'll Buy My Lavender? Lavender at this time of year cannot be bought in the streets for a song, but nobody would know it who contents themselves instead with "Linsasha," the lavender sachet par excellence. And what, by any chance, could be a Yule Tide gift of greater charm than the fascinating fragrant things through which the inimitable scent of lavender, as it really is, is brought within our doors.

Lavender sachets have existed before; but nothing can eclipse the claims of Linsasha. Just one or two tucked in a cupboard or drawer perfumes not only the whole space, but all that is in it, though there is not the least suggestion of the over-scenting disliked by many.

As to price, this is the most accommodating affair—one by itself without a box costing sixpence, postage one penny extra, or one dozen in a neat box being 5s. 6d., with postage, in this case, threepence extra.

A notable work in connection with the care of the wounded is that being done at the Headquarters of the Sir Frederick Milner Hostels for Deafened Soldiers, 26, Wilton Crescent, a house kindly lent by Lord and Lady Lamington, where lessons in the art of lip-reading are given to men who have lost their hearing in the war. The idea is that of fitting these men to take up occupations from which the deaf are, as a rule, barred. The Committee appeals for funds to pay for the upkeep of this establishment, and to teach trades and secure employment for men deafened on service. Any who wish to assist in this praiseworthy work may send subscriptions to the Honorary Treasurers of the Hostels, at the above address, by whom contributions will be gratefully acknowledged.

The gift of the time— the "Land & Water" wrist-watch

As a gift for men in the Naval, Military,
or Air Services—for active, energetic
civilians—in fact, for every one, there is,
perhaps, nothing so valued or so useful
as a "Land and Water" Wrist-watch

The fact that the "Land and Water"
wrist-watch carries the guarantee of a
British firm with over a century's repu-
tation, that it can be regulated never to
lose or gain more than two minutes per
month, or roughly, at the most four
seconds per day, under all conditions, is
in itself a wonderful tribute to the watch.

But, in addition, the "Land and Water"
wrist-watch has the advantage of being
dust and damp proof. The movement
is fully jewelled and fitted with Micro-
meter Regulator to give fine adjustment,
while the watch is adjusted and com-
pensated for all positions and tempera-

tures. Actual tests have proved it equal to a 40-guinea Chrono-
meter. It stands all the shocks, jars, and strains to which a
wrist-watch is subject under severe Service conditions.

It is fitted with unbreakable glass, thus rendering dial protectors
unnecessary, and the luminous hands and figures are far more
brilliant and durable than the usual.

The "Land and Water" Wrist Watch,
with unbreakable glass and lumin-
ous dial £5 0 0

9-ct. Gold Model, white dial £10 5 0
(Black Dial 5s. extra.)

Steel Wristlet extra.

"I am writing to tell you that the 'Land
and Water' watch which you sent me out some
months ago has kept splendid time under most
adverse conditions and changes of tempera-
ture. I always take it in the air with me, and
it has never varied, nor have several sand
storms had any effect upon it. I consider it
the best watch I have ever had."—Lieut. J. T.,

"TONNAGE IS VICTORY"

THE First Lord of the Admiralty, in his speech to the House of Commons last week, declared that "we must have ships and more ships and still more ships." The Prime Minister, speaking at Gray's Inn four and twenty hours later, caught up the same warning and echoed it in the phrase: "Victory is now a question of tonnage and tonnage is victory." These two clear statements are welcome. Circumstances have tended to obscure the peril of loss of shipping, and though there have been members of the House of Commons, notably Mr. George Lambert, a former Civil Lord, who have consistently endeavoured to obtain the actual truth of our losses, their endeavours have not met with success, mainly because the Government continue to hold the opinion that exact figures would tend to hearten the enemy rather than to encourage the people of these islands to practise a more rigid economy. It is, of course, a matter of opinion whether silence is the best policy where such grave issues are at stake; but, in any case, nothing could be plainer than Sir Eric Geddes' own words: "the submarine menace is held but not yet mastered." This point of view gains new emphasis when convoys between our Northern ports and Scandinavia are sunk by enemy cruisers. There is no margin of shipping to spare, and it is the manifest duty of every citizen to take thought for himself how by limiting his own requirements he can help to save tonnage.

The Prime Minister has recently made two statements which are likely to produce a false impression. The first was to the effect that the construction of merchant shipping for 1917, combined with the tonnage which the country was able to purchase, would reach a minimum of 1,800,000 tons. It has been frequently stated, and the statement has never been denied, that we cannot hope to build as much as one million tons of shipping this year. Taking this in connection with the heavy toll on British shipping which is indicated by the weekly figures, together with Sir Eric Geddes' statement that the enemy has not yet reached his maximum output of submarines, the position is undeniably serious. The second misleading statement of Mr. Lloyd George, from which, by the way, the First Lord was very anxious to dissociate himself, was to the effect "I have no fear of submarines." We venture to think that such an attitude towards the submarine situation, if universally adopted, could only lead to disaster. The most appropriate comment on the subject is the criticism made by Sir Eric Geddes: "Our shipbuilding is not yet replacing our losses, but amongst all the factors which go to the solution of this problem, I deprecate the drawing of deductions from the experience of any one week or month, be it good or bad. It is the general curve in each of the factors which we must watch, and upon which we must base our policy and our

opinion as to ultimate results."

What steps are being taken to cope with our losses? It is admitted that the only effective way of retrieving the position is by an increase of output, since we have not so far discovered any adequate means of disposing of the submarine. One of the means which has been adopted is the construction of national shipyards. Mr. George Lambert, speaking in the House of Commons, gave grave reasons for doubting the wisdom of embarking on this new policy at this juncture. A very able review of the policy appears in an article entitled *The National Shipyards* in the current number of the *Spectator*. If it is true: (a) that the private shipyards are at present nothing like fully employed owing to their lack of labour and materials; that only single shifts are being worked in the private yards and that some slipways are empty, and (b) that the National yards will not be able to launch a single ship until the end of 1918; while some experts even consider that none of these ships can be finished before 1919, it must surely be madness to make such a drastic change in our shipbuilding programme at this serious moment of the war. Has the Prime Minister been wisely counselled? It has been freely stated that the Advisory Committee on Shipbuilding, which includes among its members some of the most important shipbuilders in the country, disapprove of the policy. The scheme was initiated by General Collard, apparently in haste, we hope we shall not have to repent at leisure. This is a subject which ought not to be closed, and if we have made a mistake there is still time to retrieve it. We have had enough of hastily-considered enterprises in this war.

We do not wish to deprecate in any sense the enormous effort that is being made in the construction of British shipping, more especially when due regard is paid to the heavy demands on the man power of the country, and the immense and increasing output of munitions of war. But what we are concerned with is the need for plain statements and the iteration of actual facts. Sir Eric Geddes has displayed a frankness in this respect which was lacking in his predecessors, and he deserves the compliment of imitation by other members of the Government. Nothing could be more dangerous, or more suicidal, than optimistic and unreliable utterances on this important question. The Prime Minister has been an offender in this respect. When he announced that five enemy submarines had been destroyed in one day, he created an entirely erroneous impression—an impression which must have been obvious, had he paused to weigh his words. Since he evoked the ready cheers of the House of Commons with this statement, its members have listened to the quiet announcement of the Admiralty that the enemy is building submarines faster than we can sink them. We are now fully aware the rate of destruction of the world's mercantile tonnage is much greater than the rate of construction. These truths are no doubt unpleasant, but there is no occasion for alarm, provided the civil population exerts itself to restrict the need for tonnage. We have to increase to the very uttermost the home production of vital necessities.

The necessity for building tonnage, and tonnage on a great scale is fully appreciated in America. On another page we give an illustration of an American standard steel ship on the slips, for which we are indebted to the *World's Work* of New York. This leading magazine, in the course of an important article on the output of American shipping, asks: "Can the United States build 5,000,000 tons of merchant shipping a year? . . . Unless we have an enormous merchant fleet, the products of our factories and our farms, to say nothing of our training camps, must remain in our own country where they will render little service in bringing the war to an end." It has been estimated that it will require three million tons of shipping to bring an army of 500,000 men from America to France and keep it supplied; or six million tons to bring over one million men, which, of course, does not take into account the risks in transit. To realise what these gigantic figures mean, it is only necessary to compare them with the total tonnage of the world before the war. We do not doubt the capacity and resources of the United States, but we cannot ignore the immensity of the task. It is a long way from the passing of estimates to the completion of ships; from the creation of an army to its presence in the fighting line.

The Brenta-Piave Battle

By Hilaire Belloc

IN the midst of an extraordinarily and even suspiciously candid "drum fire" throughout the enemy Press, prophesying great things upon the Western front in France, it is remarkable that the chief effort actually undertaken by the enemy at the moment, and certainly the one which promises him most immediate results, is not there but in Italy.

There he has armies flushed with very great recent victories; there he has a vast concentration of guns; there he is spending men in great numbers and there, if he succeeds in his effort of reaching the Plains, which he is slowly approaching, a true strategic result will follow immediately. There also he hopes not only for a strategic but for a political result.

It must be remembered (looking at it from the enemy's point of view) that his decisive successes hitherto have been the political elimination of one factor after another, running from north-east to south upon what used to be the great siege ring around him. He has occupied or brought into his alliance the Balkans; he has caused what used to be the Russian State to fall to pieces, and with this collapse he has made certain of an armistice along his Roumanian front also. The next logical step in such an order would be the attempted elimination of Italy. Should he achieve that end he could then concentrate at once for his last throw with a superiority he would then have acquired against the West.

Whether this be his plan or no, it is not only impossible to determine, but if it were his plan for the moment there is no reason why it should continue to be so. All we can judge is the chances of the position, following from its known factors, and those in the first place lead one to believe in a special effort against Italy—and in the second place show—as a matter of fact, that this effort is actually being made at the moment.

Of the various sectors of the Italian front upon which he may act and has acted in the immediate past, one, that between the Brenta and the Piave, is the theatre of his present offensive.

Between the Brenta and the Piave is a distance of about 12 miles. It is upon this sector that, in the past week, the heaviest effort of the enemy has been made towards materially increasing his present advantages in the war.

I propose to examine this sector and to explain the general lines upon which the attack has taken place and its measure of success.

The so-called line of the Piave which our Italian Allies took up after their heavy defeat at the end of October is in reality concerned only in part with that insufficient river obstacle. The Italian Third Army does indeed run down the line of the Lower Piave from the point where the stream leaves the mountain to the marshes and lagoons of the Adriatic coast. But the line continues eastward from the Upper Piave through the mountains, another 40 odd miles, to the Adige. These remaining 40 miles are clearly divided by nature into two sectors, the common boundary of which is the deep valley of the Brenta. The active part of each of these sectors is much the same in length, 12 miles separating the Brenta from the point west of Asiago where the present pressure ceases, another 12 miles separating the Brenta from the Piave.

These three sectors correspond exactly to the three main Italian bodies.

The 1st Italian Army runs from the Adige to the Brenta; the 4th from the Brenta to the Piave, while along the Piave itself lies the 3rd Italian Army.

Let us first premise what must be perfectly clear to anyone who knows the character of these rivers or who even consults the map alone.

The line thus taken up was strategically weak as compared with the much stronger line of the Adige. The reason of this comparative weakness being *First*, that the line of the Piave was not perpendicular to its communications, but in more than half its length parallel to those communications and very close to them. When your line is perpendicular to your communications as in the Sketch (II) annexed any set back, only makes you retreat along your communications, which remain intact. But when your communications are nearly parallel to your line—as in (II)—then any setback may cut your communications. That is the position on the Italian front. The main communications run along the plain under the mountains and the Piave line for nearly two-thirds of its length parallel to those communications and only a few miles away from them.

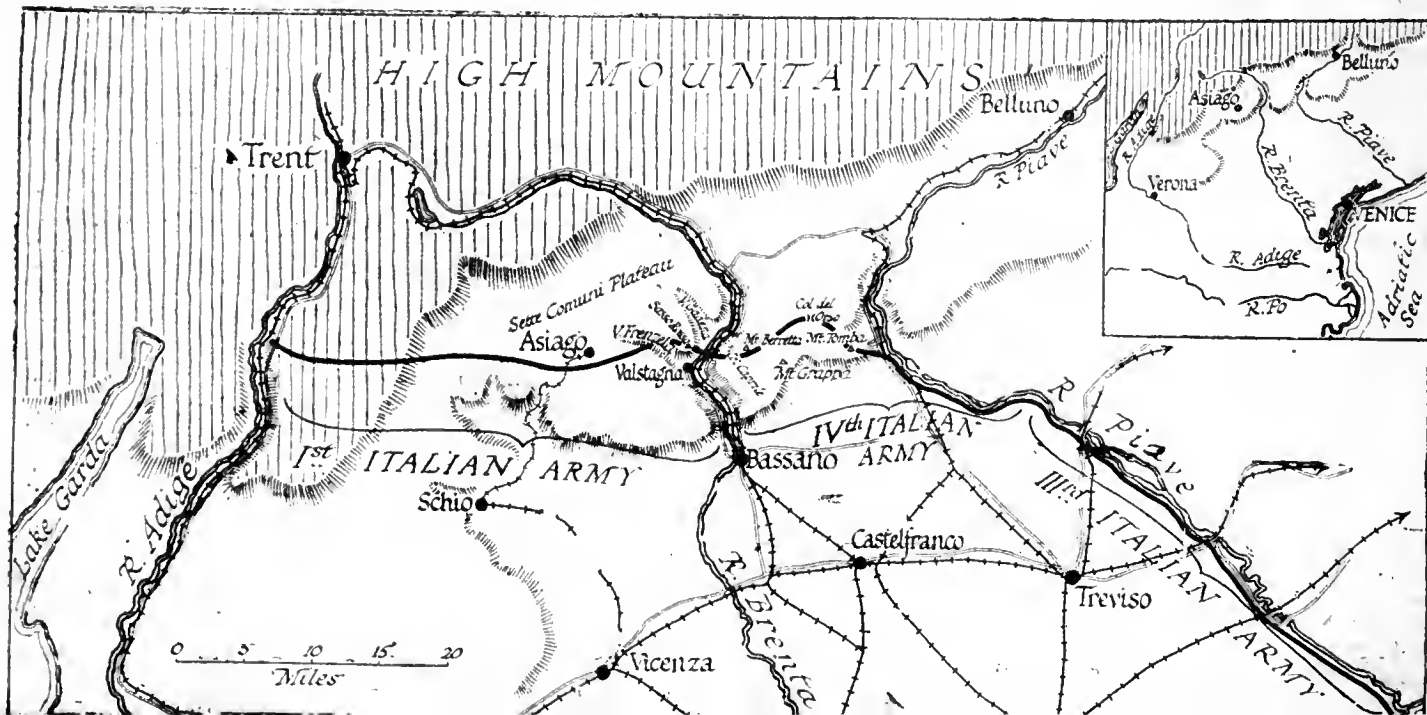

Second, that the Piave is no true military obstacle save in quite the last few miles of its course, whereas the Adige is a deep, broad and swift river with difficult muddy banks.

Thirdly, that the whole line (not the part which follows the Piave alone) is longer than the line of the Adige, if we mean by the line of the Adige a line following that river and cutting across to the Po, where the Adige turns to the sea at Rovigo.

Fourthly, that the line of the Adige reposed securely upon two flanks, one on the Po, a very broad and very rapid river exceedingly difficult to cross under any reasonable measure of opposition proceeding from a modern defensive; the other secured by the very difficult mountain system to the west of Lake Garda, with only one road pass, high and easy of defence, by which it could be turned.

In other words, the line of the Adige would compel the enemy to a frontal attack upon a short front, and that front defended by a formidable obstacle. The so-called lines of the Piave give the defensive a longer front to hold, with only part of it defended by an obstacle and that obstacle an inferior obstacle, and above all it lays the defensive under the peril of being turned in flank and finding its communications—which run parallel to it—cut, if a push from the mountains should succeed in reaching the main railways on the Plain.

The reason that the worse of the two lines was taken up was a political reason, and at this stage of the war political reasons have a much higher value than they had even some months ago. It was imperative in the judgment of those best fitted to weigh the circumstances that Venice should be preserved, and also the rich towns and district lying on the Plains east of the Adige. On this account were the lines of the Piave taken up when the long-prepared lines of the Tagliamento, upon which it had been hoped to stand, were found untenable under the still tremendous momentum of the enemy's advance.

by troops still shaken as were the defending troops by their recent disasters.

The Piave line with all its inconveniences having thus been determined upon and ultimately heavily reinforced by large British and French contingents, it was clearly the enemy's game to turn it from the north. It would not profit him much to force the lines on the Piave itself, merely compelling a further retreat along communications perpendicular to that front. But if he could come down from the mountains in the north, that is, upon the Italian left flank on to the Plain only a few miles away, he would cut the main Italian communications and round up the great mass of his opponents. Following upon his first successes it would certainly be a decision.

The further to the west this turning movement might succeed, the greater would be its results, and the enemy was concerned only with holding the Italians upon the Piave by attempted crossings in no great force, while he carried out this turning movement from the north and the mountains.

In that turning movement he is still occupied and, though its fortunes are not yet determined, the delay which the resistance has caused, the falling snow, the moral effect of so successful a defence, all increase the chances of our Ally and of our own troops in this region, and make the present moment an excellent one for surveying the position as a whole.

After the first rush of the pursuit from the Isonzo to the Tagliamento and from this river to the Piave, nothing serious was to be feared until the enemy should have brought up his heavy pieces and, what is a slower business, should have accumulated his munitions for a general bombardment. It is clear that his original success upon the Isonzo was quite beyond his own expectations, for he had prepared nothing to the north upon his right to cut off the Italian retreat. It was

extreme Italian left against the Italian 1st Army, was undertaken by Austrian forces under General Conrad. Its object was to reach the Brenta Valley by a direct thrust down that line and along the west side of the deep and rough ravine called the Frenzella and by the easier Gadena ravine. His operation was so far successful that—as we have seen—it cleared the high peaks to the north by December 4th, and thrust the Italians from the Sisemol Height which dominates the Frenzella and from Tondareca and the Badalecche, which dominate the Gadena. But it did not force a way down either of those two valleys. The Italians fell back on a position of lower heights, which still bar the way down the ravines. To the west of the Frenzella they still held the Scher and to the east the Sasso Rosso, while between the Gadena Ravine and the Brenta they held the hill of Alessi, which overlooks San Marino in the Brenta Valley. San Marino, that is, the mouth of the Brenta, could still be held until the enemy should be able to throw the Italians right back from the Beretta Pass and the Caprile Pass on the other side of the Brenta, and this, as we shall see, is what he was trying up to last Saturday to effect, and partly succeeded in effecting. In order to get San Marino and master the Gadena Valley way down from the mountains to the main Brenta Valley, he began a new series of attacks east of that river for the possession of the Caprile and Brenta passes.

We find them massing, therefore, for this second effort (which is not yet completed) an even larger mass of artillery, some 2,500 guns in the 12 miles between the Brenta and the Piave.

This critical action, which is still in progress at the moment of writing, opened upon Tuesday, December 11th. It has fallen, roughly speaking, into two divisions so far.

some weeks before his preparations upon this right wing in the mountains were even partly completed. Infantry attacks, supported by a moderate weight of artillery, took place indeed from as early as the second week in November. But that decisive effort with heavy guns which we had so long been expecting and before the advent of which nothing taking place upon these lines was of any real moment, was not begun until the end of the month.

The first great concentration of pieces was made where the fruits of it, if they could have been gathered, would have been most effective, to wit, upon the west, that is, upon the Asiago Plateau, called also the "Sette Comuni." It has been estimated that some two thousand pieces of all calibres were working here in the first week of December, upon a sector, the extreme limits of which were little over 20,000 yards, and the active part of which was much less. Such a concentration corresponds to the other great offensives in this war, the late one upon the Isonzo and those of Verdun and the Trentino last year.

The attack which followed this tremendous bombardment was partially successful. It carried the salient of high peaks, the apex of which was the Castelgomberto, and here flattened out the line, but it did not come down to the Plain by many miles. It still left the lower part of the Brenta Valley in the hands of the Italians, and also left solidly in their hands the last wall or escarpment of the Alps, which defends the Plain. Putting the matter in its broadest lines, this, the first great enemy effort after the bringing up of his guns, failed. He could claim many prisoners—he claimed, I think, about 15,000 in all—the driving of the Italians down from the higher peaks to the lower, and the reduction of the great salient of Castelgomberto, which the Italians had previously held; but he had not broken through to the Plains, nor acquired the ways leading down to the Brenta roads and railway.

This first attempt, in the first week of December, on the

The first was the enormous—but not decisive—three days' attack of Tuesday, Wednesday and Thursday of last week, December 11th, 12th and 13th. Among its objectives going from west to east, were the Monte Spinoncia, the Monte Solarolo, and the Pass of the Bear, or Col del l'Orso—a very vigorous thrust upon a front of about six miles; but the crucial sector was west of all these, and concerned the Caprile and Beretta Passes over the range which overlooks the Brenta, and the fight for these formed the second operation.

A second chapter opened about a week after the first chapter had closed.

The enemy, for the moment, gave up his effort against the extreme western part of the line and struck last week in the central sector, between the Brenta and the Piave, the sector held by the Italian fourth Army. As we have seen, a success of his here would not have the same full fruits as would one upon the Asiago Plateau. On the other hand, since the first effort on the Asiago Plateau had failed, this second best had certain advantages in its favour. The distance from the enemy lines to the Plains was far less—upon the extreme eastern point he was already right upon the edge of the escarpment—and his communications for bringing material up over the high hills were, upon the whole, better.

This main effort opened upon Friday morning last, the 14th, upon the Caprile and Beretta Passes. The first was reached by the enemy, but apparently not crossed. The attack upon the second was checked by an Italian counter-attack, and does not seem, so far as the rather general terms of the communiqués from both sides inform us, to have had the same success. But the movement as a whole was checked, and registered up to that Saturday morning, the 15th, only an insignificant advance, while the prisoners of all kinds claimed by the enemy in the three days numbered but 3,000 in the fluctuating struggle.

Though, then, on Friday last, so far as we can judge from the very short despatches to hand, he was still fighting for

possession of the Caprile, on the next he did more.

For, by Saturday night the enemy had here achieved a certain measure of success, which we must not overlook.

It is true that he had only advanced by some three-quarters of a mile, and that only upon one point—but the point was a very important one: that point of the Caprile Pass upon which much depends. As long as the Caprile Pass was held the ridge, dominating the Brenta valley here, cut off the enemy from access to it or from observation of it from the east. But with the enemy once on the top of this ridge and over it—which is now the case at the point of the Caprile Pass, he dominates and overlooks the outlet of the Gadena Valley. He can now secure complete possession of the Gadena Valley including San Marino at its mouth, and of the heights overlooking it from either side, he has a second and most important avenue of approach, supplementing his direct pressure down the Brenta by columns coming down the Gadena. Of the various converging roads to the Plain only the rough and difficult Frenzela will still be closed to him. If the Frenzela should go it is difficult to see how his further progress down to Bassano could be prevented. Of course, his success at the Caprile is still under question. Only observation upon the spot could tell one how far his trenches on the south-western side of the Pass are either overlooked or enfiladed by neighbouring Italian positions, but we cannot afford to overlook the fact that, at the moment of writing and according to the latest despatches then available, the enemy has secured what is geographically the key to the middle of the Brenta ravine.

Meanwhile, the positions further to the east, right up to the Piave itself, remained what they had been for many days past. The enemy was held well to the north of that great mass called Mount Grappa, which stands on the edge of the Plain and overlooks it all. He came nowhere really near the Plain save at the last high point before the Piave, called Mount Tomba.

The exact position on Mount Tomba is not very easy to ascertain from various accounts given, and yet it would be of great importance for us to know the situation precisely, because Mount Tomba directly overlooks the Plain, and if its summit be permanently and securely in the hands of the enemy it means that the enemy has observation of the best kind over the Plain.

Now most of the French and English accounts we have received tell us in the clearest manner, the summit is in the hands of the enemy, and I have myself repeated that statement in these columns upon the only evidence available, and the statement was made long before the end of last month. But here comes evidence from the enemy's side, printed on the 29th of November in a German paper, the *Vossische Zeitung*, over the signature of a correspondent called Ross, to the effect that of the two rounded heights, the one nearly 400 feet below the other, only the lower one is in the hands of the Austro-Germans. The highest summit is called upon military maps "Hill 870 Metres," the lower one "Hill 715 Metres," and, according to the German correspondent with a Scotch name, the enemy is not only overlooked from above by the Italians, but badly harassed by them through this advantage they have.

A Demand for Unity

The winter and spring months before us will prove, as everyone knows now, the most critical period of the whole war. The reasons of this are also familiar to everyone. They consist in the betrayal of the Alliance by the cosmopolitan anarchists who are running the Russian towns, coupled with the first immediate effect of this, the heavy Italian defeat still only a few weeks old—while the weight of America cannot be brought to bear until well on into the fighting season of 1918.

But over and above the appreciation of our difficulties and of the very heavy strain immediately before us, there must be equally appreciated the imperative demand for unity, and unity lies in three things. Command in the field, war aims, and discipline at home.

Unity of command has been spoken of, if anything, too much. We will return to it only for a moment. Unity of aim common to the various Allies has been obscured by wanton discussion and must be restored. But there is a third form of unity equally essential and perhaps more difficult to obtain. It is domestic unity and voluntary acceptance of a political discipline which is as vital to the coming struggle as any other factor—even as military discipline itself.

Unity of command, the first of the three aspects of unity in the Alliance, has been ill-defined as the necessity for a single commander, acting with his single will. It has already

been shown in these columns how extravagant and even fantastic is such a claim, and how the ideal of unity of command between various equal and federated Allies must aim at something very different. I am glad to see that this obvious but cardinal point has been supported in the last few days by that military writer who carries by far the most weight of all upon the Continent, I mean M. Bidou of the *Debats* newspaper. It is perhaps characteristic of the modern Press that his remarks were quoted in London with his name so misspelt as to be unrecognisable, and without insistence in any leading article or in any message from a Paris correspondent. His pronouncement was none the less of the very first importance. No one hears more than he does of French military opinion or is more trusted for his judgment. He has pointed out in the clearest possible manner that unity of command in the case of such an Alliance as ours depends wholly upon the co-ordination of wills—in plain language upon getting on well with our Allies—and not at all upon some theoretical scheme for subordinating each national command to one arbitrary head. M. Bidou has put the argument so well that I need do no more than repeat it.

"If" (he says in effect), "you could turn the United States, the British Empire, the Italian Kingdom and the French Republic into one political group having at the head of it an irresponsible military despot, if, in a word, you could make something like one nation of them, and that nation organised

as a military despotism, it would obviously be (from the merely military point of view) of advantage—always supposing that such despotism was efficient on the military side. But one has only to state such a theoretical conception to show its absurdity. The whole point of the Alliance is that it is a congeries of free and different peoples fighting the mechanical force of Prussia. You would, by attempting to give one man supreme command over such diverse national elements, wantonly create, and that in an indefinitely high degree, friction which is the great enemy of efficiency in any machine. As a matter of fact, you always have a more excellent co-ordination and understanding between the various staffs than has ever been attained in any previous Alliance, and to tamper with a state of affairs already excellent would be to ruin the only practical working method available."

Unity of aim between the Allies is attained at once if we define it as the Premiers both of France and of England have defined it within the last fortnight; they have defined it as *Victory*.

The moment you propose to discuss in detail what you will do *after* victory, you are wantonly borrowing trouble. Upon the form, the extent and the date of victory a hundred details of future reconstruction will depend. The very hopes or demands of each partner to the Alliance overlap the corresponding hopes or demands of others. There will have to be judgment of the most delicate kind, patient dealings and comprehension. There will have, too, to be time, leisure and a mass of expert work added as ingredients to any final settlement. None of these can be added in the crisis of the struggle; and meanwhile short of victory—that is, short of the putting out of action of the Prussian military machine—all discussion of a settlement is undignified and futile. Those who say that the Prussian military machine cannot be put out of action, that is, those who accept defeat and consequently propose surrender, do not seem to perceive that the settlement following such action would be a settlement confirming every evil principle against which civilised Europe put up this just defensive war.

If there be anyone who imagines that an undefeated Prussia will release the Danes or the Poles, will permit the Magyar-German combination to release Serbs or Roumanians, or the Southern Slavs of Croatia; will give up the great road to the East; will restore the freedom of the Black Sea or of the Baltic, and will consent to undo its vile work of enforced exile and artificial colonisation in the districts it victoriously annexed a generation ago, he is living in a totally unreal world. He is living in a world equally unreal if he imagines that the precedents created by Prussia and by Prussia alone in the present war—the bombardment of open towns from air, sea and land, the enslavement of occupied territories, indiscriminate murder at sea, and the contemptuous neglect of solemn treaties—will not remain precedents in full use for the future if their authors emerge from this war unpunished. And if he does not see that such methods are the doom of *this* industrial island in particular; that *this* country much more than any other is vulnerable to such methods, and that to *her* above all they are mortal, he is beyond argument.

Unity of aim means the clear declaration for each and all the Allies that their aim is victory; and victory is no vague and rhetorical word. It has here a precise meaning which we will repeat. It means the putting out of action of the Prussian military machine.

The failure to achieve this is the opposite of victory and is defeat. To accept defeat before it has been inflicted, with every force still intact, with vast armies still in process of recruitment, and with such powerful aid arriving in the near future, to accept defeat under such circumstances gratuitously, to bestow it as a sort of gift upon an enemy who has not yet been able to impose it, would be a thing unprecedented in the history of even those little dynastic struggles which seemed so important in the immediate past of Europe: in a struggle of this kind it would be self-destruction deliberately accepted.

If, after the sharp reaction of the last few weeks, there be any who still propose such a policy, it can only be because they do not appreciate what the Alliance is. One party to the Alliance cannot say to its fellows: "I find myself unable to bear a strain which you have borne. I do not propose to run the risks of suffering what you have suffered. I have attained my objects—I am now indifferent to yours," without ruining itself as well as the body of which it is a member. Only an extreme isolation of the mind, or an extreme ignorance of the past, or both combined, can explain such an attitude. And to this argument one may add what should surely by this time be patent to all, that, of the various members of the Alliance none will be more permanently the object of tenacious future attack, political and economic, and, if necessary, military, upon the part of an undefeated Prussia, than Great Britain and the British Empire. There may be accommodation elsewhere—but here certainly there will be no accommodation.

It is a little shameful even to have to argue such things, even to have to rebut such pretensions, but as they have been put forward they must be met, though that as briefly as possible.

There remains the third aspect of unity, less obvious, I think, and yet equally essential—unity at home; the civil discipline which is more essential than ever to the conduct of the war.

The period immediately in front of us will demand this action after a fashion to which the country and the Press is unaccustomed. From the sham battles of professional party politics (now dead and gone, but still leaving their habits behind them), to the really serious divisions of opinion—such as those upon Ireland—there is so long a tradition of discussion, and of action stronger than discussion, that it is difficult for such a society as this to arrest the momentum of it at short notice.

Quite apart from the sort of debate and argument which gets things done—and that is a very small proportion of the whole—there is a long rooted public manner of taking sides upon almost any question, for little more than the pleasure of the debate. It has always filled and still largely fills the Press and the conversation of men. Now in a moment of acute crisis, in a moment which is really vital in the full sense of that word, even discussion of this sort is an error. Opinion is inflamed under the great strain of the time, and what might be in peace criticism at the most, or at the least mere verbiage, may suddenly become a grave irritant.

Scapegoats

But there is something much graver than the fixed habit of opposing discussion and criticism of men and measures. It is the tendency in the last phase of an exceedingly difficult struggle to blame and upset the individuals who happen to be nominally responsible for the public conduct of affairs. The making of scapegoats is the easiest of all tasks, as it is the most demagogic, and in a period of doubtful war full of minor reverses, it is the most fatal. The truth is that it matters exceedingly little in the conduct of a campaign, and especially in its last stages, who the civilians may be that are given the advertisement (and emoluments) of nominal power. The temper of the workshops, the efficiency and elasticity of the Civil Service, most of all the moral and material state of the armies and navies—these are the things that determine the issue. What particular politician may have to answer questions in Parliament for this or that department makes exceedingly little difference save, indeed, upon the negative side. A man may be so vain and foolish as to interfere with his nominal subordinates in their own trade—of which he can, by definition, know nothing—and by that interference may do great harm. But the idea that he can do positive good, or that by putting one politician up in the place of another any appreciable acceleration of effort can be obtained, is the merest moonshine.

On the other hand, to disturb the existing combination of politicians, to ask for a re-shuffling of what are only counters, and to reinforce those personal recriminations, personal ambitions and personal hatreds, of which the political world is full, and on the play, indeed, of which it normally depends, is to provoke a fatal division of energy. For heaven's sake let us leave all that alone until the victory is won. None of the citizens in any of the Parliamentary countries are at all proud of their Parliamentarians. We are not peculiar in this. It is true of all the modern nations which have now tested these corrupt little oligarchies and found them wanting. But war, and especially such a war as this, and more especially the heaviest moment of such a war, is not the time for a theoretical discussion of institutions, or a practical change in them. Let us remember that the reconstruction that must come at the end of hostilities will breed the gravest, the most profound, and therefore, perhaps, the most violent dissensions we have known. When that moment arrives, the personal pretensions, which we all despise, will be consumed in the heat of great popular emotions, and under the glare of complete publicity—for if there is one thing more certain than another it is that the old hypocrisy which pretended greatness in almost any public figure, and which protected the politicians from hearing the truth about themselves—will be utterly impossible when the real passions which will fill the years succeeding are at work. The rearrangement of society will give to every critic and to every enthusiast as much opportunity as he could desire—probably far more than he will like; and whether that arrangement shall be a renewal of the national life or a disaster depends entirely upon whether we succeed or fail on the field of battle. The social temper after the war will depend entirely for its character upon whether we have enjoyed victory or suffered defeat. Let us, then, by a strict discipline during these last months of the war, do the only thing that civilians can do for victory, which is to be silent and to obey.

H. BELLOC

M Caillaux

By J. Coudurier de Chassigne

I SHALL never forget the first time I met M. Joseph Caillaux. It was in the spacious and imposing room which is used at the Ministry of the Interior by the Minister in office as his bureau. Behind a large and beautiful table which reminded one of the past glories of French cabinet-making, a dapper little man sat in a gilt armchair. His face was all smiles and full of life, with bright expressive eyes set under an extraordinary forehead which seemed never to stop, and looked as if it went to the very back of an almost completely bald head, which evoked the image of an immense smooth and shiny billiard ball.

I had hardly entered the room when the little man jumped up from his seat and came to me cordially with out-stretched hand. A brief introduction was made by my friend, M. Cruppi, then Minister of Justice in the Cabinet whose President was M. Caillaux. With the gesture of a man who wastes no time in unnecessary formalities, the President motioned me into the big armchair next to the large table. M. Cruppi, who took but little share in our conversation, let himself fall into another armchair by the fire. Then, if I may say so, the curtain was rung up on one of the most extraordinary scenes which it has ever been my privilege to witness in my long life as a journalist.

It was a Sunday morning in the beginning of October, 1911, to be accurate, October 8th, during the lull which preceded the signing of the Franco-German convention of November 4th, 1911. The French Government had embarked in difficult negotiations with Spain concerning Morocco, and the fruit of all our efforts in Berlin might easily have been compromised through a rupture with the Spaniards. It was to discuss this aspect of the Moroccan problem that M. Caillaux through M. Cruppi, had requested me to come to Paris.

A Personal Interview

At the opening of our interview, M. Caillaux asked me what was, in my opinion, the real feeling in England, and especially in politic circles on the Morocco question. He listened to me attentively, smoking all the while a penny cigar which, as I was able to discover for myself while smoking its twin brother, was not even worth that price. When I had finished my survey of the situation from the English point of view, M. Caillaux got up from that gilt armchair in which I had seen M. Briand sitting a few months before. He began to pace up and down the room, his arms crossed behind his back, chewing his cigar. Suddenly he stopped, and pulling nervously at his dark moustache, said: "I want to go to London. You must arrange a luncheon with Mr. Asquith. Only the three of us should be there. My journey must be secret. I shall only be away from Paris for 24 hours, but I must discuss rapidly with Mr. Asquith the whole African question. I will offer him a complete readjustment of the map of Africa. We will exchange colonies and territories according to our common interest. We shall easily come to an understanding, for Asquith and I are two practical men, he, because he is English, and I because I am a business man. We will settle in three hours what these fools of diplomats would take years not to settle. In exchange for the concessions I am willing to make to England I shall ask Asquith to promise me his strict neutrality towards the Franco-Spanish negotiations. Of course, England ought to back us against Spain, but if, as you believe, they have made up their minds to adhere strictly to their past agreements, I shall only insist on their remaining honestly neutral in this matter. Of course, this interview with Asquith must be known to nobody but yourself and our friend here," and he pointed with his cigar to M. Cruppi.

"But," I began, "you do not mean to say that you want me to go behind the back of our Ambassador in London, M. Paul Cambon?"

At this remark M. Caillaux exploded, and told me with a choice of expressions which do not bear reproduction in print, what he thought of diplomacy in general, and of the two brothers Cambon in particular. He said he had already mentioned to M. Paul Cambon his great scheme for the exchange of French and English territories in Africa. If, however, the latter did not hurry up and obtain some results, it would be the worse for his brother, M. Jules Cambon, our Ambassador in Berlin. Should the Franco-German negotiations fail, as was still very possible, M. Jules Cambon would pay for it. Moreover, added M. Caillaux, it was quite likely that French public opinion would not swallow the Congo pill without a general redivision of the map of Africa, and a diplomatic success at the expense of Spain.

Then followed bitter criticism of the policy of M. Paul Cambon towards Spain, which I had good reason to know

had been straightforward, honorable and patriotic.

I could stand no more, so interrupting M. Caillaux, I exclaimed: "I refuse to accept any mission behind the back of M. Paul Cambon, firstly, for private reasons, for he has honoured me with his confidence ever since I have known him. But, apart from this, let me tell you that he has been the best servant your country has ever had in England. He enjoys the entire confidence of the Prime Minister and of Sir Edward Grey, and Englishmen are not prone to trust anyone lightly. A proposal from you direct, or from anybody else acting on your suggestion, will certainly not be acceptable to them. To act outside our Ambassador, would not only be, as far as I am concerned, an act of disloyalty, but also an act of stupidity."

This argument seemed to go home.

"Well," said M. Caillaux, "tell him what you like and arrange the luncheon as you think best."

"I am afraid," said I, "that also is impossible, for the simple reason that the Prime Minister of France cannot leave Paris even for 24 hours, and especially during the present crisis, without all the German spies here discovering where he had gone to. Think of the effect it would have not only on public opinion in France, but also in Germany, if it were known that you have gone in secrecy to confer with the Prime Minister of England. You would be accused at once of arranging a definite alliance with England. Everyone would believe that we are on the eve of declaring war against Germany with the consent of the English, and with the certitude that they are coming into the fight with us."

I spoke with energy, and M. Cruppi, who knew me well, was good enough to approve my point of view. He, too, eulogised the two Cambons, and assured M. Caillaux that I had some knowledge of English politics and politicians.

Suddenly M. Caillaux subsided into silence; then pirouetted on his heels, and sat in his armchair. Lighting another penny cigar, he puffed away at the evil-smelling smoke and said quietly: "After all you are right, I cannot go to London. But do the best you can yourself, see Mr. Asquith, say what you please to M. Cambon; only try to get practical results. Then if you succeed, write to M. Cruppi, and let us see what happens."

In reply to this appeal I remarked that however much honoured I felt by his confidence, I thought it useless to make officially or unofficially such a proposition to the British Government. I felt certain that the Prime Minister would never consent to any general scheme involving a revolution in the organisation of the English colonies in Africa. He would never adopt M. Caillaux's policy to cut and piece together in one afternoon British spheres of influence in Africa. A British statesman would inevitably refer the matter to the different departments involved, and ask for reports, necessitating long enquiries, from the various Ministers. It might take months, even years, before such a scheme could be prepared and matured.

One must give M. Caillaux his due. That violent and choleric little man, who is always ready to fight, has none of that false dignity which resents criticism. A mere nobody like myself got as fair a hearing from him that day, as any of his colleagues would have obtained; and though I refused the impossible task he wanted to put on my shoulders, we parted good friends. At that moment I knew nothing of his secret negotiations with the German Government. I only realised that in his apparent patriotic fervour he was willing to quarrel with any nation which did not do exactly what he wanted to ensure the success of his policy. Had he not said to me, with a violence which gave me furiously to think, that if England backed Spain against France, we should quarrel with her, and this after Agadir!

When I left the Ministry of the Interior, after our conversation which had lasted nearly two hours, I could not still the impression that I had been discussing grave political and diplomatic questions with a madman. His brusque gestures, his sudden fits of passion which made his bald head turn scarlet, his exaggerated notions on foreign politics, his complete lack of psychological insight into the feelings of other nations, forced me to the conviction that something was missing in that otherwise remarkably quick and comprehensive mind. His cynical remarks, his contempt for the most elementary rules of private or public loyalty, and even honesty, proved to me that what I had previously heard concerning his legendary amorality was not mere idle gossip. And I came to the conclusion that M. Caillaux was not really so intelligent as he seems at first, owing to his great facility of speech and the lightning quickness of his repartees. During our long talk he had shown no real common sense, and if a

young and untrained man, as I was then, had not pointed out some evident objections to his policy, he was quite ready to throw himself, head first, into the most impossible adventure. Had I not prevented his doing so, he would in all probability have come to London secretly, where he would certainly have met with a polite rebuff from Mr. Asquith, and other well-deserved snubs which might have led to consequences, from which both our countries would have suffered.

And to-day the whole of M. Caillaux's public and private life demonstrates the same lack of real intelligence, the same lack of common sense.

A Creature of Impulse

Perhaps one might best describe him as a creature of impulse, with no notion of what ordinary men call right or wrong. By training he is an expert in all questions of finance, having belonged during the years of his youth to the Corps of Inspectors of Finance. At the same time, he has always mixed himself up in financial affairs and in dealings on the Stock Exchange, with the result that he came to apply to higher politics the methods of an ordinary stockbroker. When shares go up he buys for all he is worth; when they go down his only thought is to sell a bear as quickly as possible, regardless of consequences to anybody but himself. He has dealt with the affairs of nations as he used to deal on the Stock Exchange. In that market the only idea is to make money. In politics M. Caillaux's motive was to reach the top of the ladder, and to get there by all and any means. As long as England served his aims he was her friend, but if by any chance she did not fall in with his tortuous devices, he was prepared to turn against her immediately. He gave one the impression of a gambler who thinks only of the present, and is unable to remember the past or to foresee the future.

Thus when M. Caillaux requested me to submit to the British Government in a friendly and non-official capacity his scheme for the wholesale rearrangement of the African map, he was betraying, I am sure unconsciously, but all the same betraying, the most sacred interests of his country. He was willing to consent to any plan, even if more favourable to England than to France, in order to save his face and to enable him to mount the tribune of the Chamber of Deputies and to state in appropriate language that the Franco-German negotiations were not only being conducted in a most friendly spirit, but were also part and parcel of a vast project of re-organisation of the whole colonial system in Africa. If England had not been, as always, perfectly loyal to her own traditions and to her friends, she might have been tempted to accept the good and easy bargain that M. Caillaux was willing to offer her. In this case she would have profited by the moral treason of an ambitious French politician, who, to secure a personal triumph, was ready to sacrifice the ancient and lasting interests of his country. But I am happy to say such a scheme was still-born with an honest man like Mr. Asquith at the helm of the British Government.

On the other hand, ten minutes after declaring to me his willingness to benefit England in the exchange of colonies, if she decided to back us against Spain, or even to remain strictly neutral, M. Caillaux was uttering violent menaces against her for insisting that we should remain true to the letter and to the spirit of our own treaties with Spain, approved and guaranteed by her at the time.

Such an attitude has only one explanation. M. Caillaux is, as I have said before, not quite sane, and I know of no greater danger for any country than to have been or to be again under the direction of a lunatic. At the same time, his pathological condition is not of the kind which would justify one in absolving him of responsibility for his actions whether public or private. Nevertheless, for the last seven years M. Caillaux has been for me a psychological enigma. As I followed the development of his career I realised more and more the abnormal character of his intelligence. In some respects his cleverness and adaptability seemed unequalled by any other living politician. He could grasp with extraordinary rapidity the main points of a complicated problem, and once he had made up his mind, nothing would alter it. For example, during the Franco-German negotiations of 1911, he gave M. Jules Cambon, his Ambassador in Berlin, strong and unflinching support. In that sense M. Caillaux was tenaciously patriotic. But, on the other hand, he was incapable of distinguishing between an honest and a dishonest means of attaining his end. To him all men were the same—bandits, masked or unmasked, who all had their price, if they had any intelligence.

Of course, he admitted the existence of another class of human beings—the mere fools who were incorruptible. But the only section of humanity which interested him was composed of his friends, and they were very strange friends, for whom he had a genuine devotion. They served him and he was always willing to pay them well in money, position or

honours, whatever their past or their present. The rest of the world was of no account, and he treated it well or not according to the circumstances of the moment.

I only saw M. Caillaux three times in my life. At our second interview he told me that he had plainly intimated to the British Ambassador in Paris that if England did not help France energetically against Spain, he, Caillaux, would have no difficulty in finding for his country other friends—meaning, of course, Germany! He also said that when discussing this question with Sir Francis Bertie, one day when they were shooting together, he had remarked: "What you tell me is childish," to which the British Ambassador, with his well-known caustic humour, had answered: "Well, I am an old child and I did not know it." M. Caillaux was delighted with what he considered a charming witticism, and he added as a passing comment, after relating the story: "Bertie and myself are great friends." But he went on to declare that in France public opinion considered that England had left us in the lurch when she did not send a boat to Agadir.

"Forgive me, M. le Président," I interrupted, "but you know better than anyone else who wired to the French Ambassador in England to beg him to prevent the British Government sending a boat alongside the *Panther*." Needless to say, it was M. Caillaux himself who was responsible for that telegram when, in July 1911, he was acting for M. de Selves, Minister for Foreign Affairs, who had just then accompanied President Fallières to Holland. Evidently surprised at my accurate knowledge, M. Caillaux could not suppress a gesture of annoyance. He jumped out of his armchair, and walking up and down in his nervous jerky manner, he exclaimed: "I know, but we are not talking now of the opinion of those who like yourself and myself know the truth."

"Pardon me, M. le Président, but is it not your duty to tell the truth and to enlighten public opinion?"

Dropping the subject abruptly M. Caillaux remembered that he was in a great hurry as he had to dine before going to see President Fallières that evening.

Six days later, on November 12th, 1911, I met him for the last time, when I submitted to him a scheme of arbitration on certain questions. But he dismissed the idea rather impatiently and there the matter ended.

An Astute Speaker

Up to that time I had considered this man merely as an unscrupulous opportunist who was almost certain to injure my country, all the more so that he had that gift, rare in France of appearing a practical person, whereas he was simply an astute speaker who could make his audience believe he was a man of business, knowing what he was about, and full of common sense—the very quality in which he is lamentably deficient. Unhappily, nothing is easier in a democracy than to throw dust in the eyes of electors, most of whom only ask their deputy to defend their local interests in Parliament, and get for them individually as many favours and advantages as possible. This M. Caillaux did with great zeal. He was the captain of that gang of demagogues who call themselves Radical-Socialists, and who are always ready to promise to their electors more privileges than their rivals offer. To politicians who have adopted this vote-catching method of securing re-election, M. Caillaux, more daring than any of his followers, was an ideal leader. Nothing in his antecedents, however, led anyone to foresee when he was a young man what his political career was to be.

His father, already a very rich man, belonged to the Conservative Union during the presidencies of M. Thiers and of Marshal McMahon. In the Cabinet of the Duc de Broglie (May 16th, 1877), he was one of the representatives of the Bonapartist party, and he filled the office of Minister of Finance in the very Ministry which was responsible for the dissolution of the Chamber of Deputies, and for the General Election which defeated the reactionary parties.

So M. Caillaux, who has always remained in manner an autocrat, gave up his family traditions to become a Republican. That was the first move to get on, and an essential one under the new regime. In 1898 he was elected by the Department of the Sarthe, which had been represented by his father in the Chamber of Deputies, where he had a sort of pocket borough. His first political label was extremely moderate. He presented himself as a "Meliniste," that is a supporter of the great moderate Republican, M. Jules Méline. A year later, the Dreyfus case having upset all Parliamentary traditions, M. Caillaux, whose republicanism had already advanced a few steps in the direction of the Left, was given the Ministry of Finance by M. Waldeck-Rousseau. When M. Waldeck-Rousseau withdrew from office in 1912, on account of declining health, M. Caillaux followed him into retreat, and was out of office till October 1906.

(To be continued.)

Leaves from a German Note Book

A House divided against Itself

A PROPER understanding of the present internal position in Germany is impossible unless the fundamental fact is appreciated that the Kaiser's Empire is a house divided against itself. A mighty struggle is seething within it. On the one hand, there are the Pan-Germans and their allies from every political camp, who are war-mad still; on the other, the more reasonable folk who are slowly recovering from their intoxication and are slowly awakening to the reality of things. The fire-eaters clamour for annexations and indemnities, demanding that "the German peace must rest on might," and "if England sues for peace, we must not listen but fight on five minutes longer." The people who are now sane support the famous Reichstag resolution of last July 19th, and are ready for peace by agreement and understanding. They have been chastened; they appraise militarism at its true worth. But they are as yet in the minority; at any rate, they have no influence. The others are still in power.

No sooner was the Resolution referred to announced to the world than all the forces of reaction in Germany—and their name is Legion—began to mobilise. The Annexationist view was organised into a party cry, and the Patriotic Party came into existence with the notorious Grand-Admiral Tirpitz at its head. The subscription was fixed at one mark annually (say, about a shilling) in order that all and sundry might join. A mighty propaganda was set on foot throughout Germany, though where the funds came from is not stated. A flood of pamphlets was let loose among the civil population and the soldiers at the front; meetings were held in every large centre of population; and whole page advertisements were displayed in all the papers of the Right. It was sought, and with some measure of success, to win over the Universities, both the Professors and the students.

Dream of Mad Hatters

There was one cry, repeated *ad nauseam*—Britain is the enemy; Britain must be destroyed. The demand recently formulated by the Bavarian branch of the Pan-German League is a good illustration of the wild dreams of the Patriotic Party. According to these Pan-Germans their country at the end of hostilities was to demand (1) an indemnity in gold of £10,000,000,000, besides foodstuffs, means of production and ships; (2) the Briey and Longwy coal-fields; (3) the Baltic Provinces of Russia; (4) complete control of Belgium; (5) the permanent occupation—"if possible"—of the northern section of the Straits of Dover, including Dunkirk, Calais and Boulogne; (6) a great African Colonial Empire, including the Congo; (7) the restoration of Egypt to Turkey; and (8) the control of the Suez Canal. Moreover, Montenegro, Albania and one-third of Serbia were to be given to Austria; the remainder of Serbia to go to Bulgaria.

Let there be no mistake about it; these demands are put forward by so-called educated, responsible people; and the claims form the true measure of their political sagacity. And these are for the most part the type of persons who govern Germany. They are urging Germans to go on fighting until these aims can be realised. Most of those who are loudest in their demand have spent the period of the war in the ease of their own homes. The most notorious of those who would kill Britain with their mouth, the well-known because well-advertised Count Reventlow, was twitted with not having gone into the firing-line, though he is of military age. This was his reply: "That at the outbreak of war he offered his services to the Navy, but the authorities had not seen fit to call upon him." Perhaps they acted wisely.

A friend of Reventlow's, a certain Dr. Hans von Liebig, who beside being a Count is also a Professor, appeals to the German people to hold out for but a few weeks longer. The war would last but two or three months more—"it is impossible that it should continue longer"—and "is a nation that has achieved so much that is truly wonderful during three and a half years of war to shrink from a few weeks more?"

Reventlow, Tirpitz and their fellows have friends at court, and they know it. They count supporters among Ministers, and the Minister of Finance of the Kingdom of Saxony is the latest prophet of their gospel. This gentleman told the Saxon Upper House only a fortnight ago that Germany will have to demand an indemnity. True, the famous Reichstag resolution set its face against indemnities. What of that? Much has happened since July 19th. That resolution is no longer valid. This indeed has become a favourite argument of the school of thinkers represented in the Patriotic Party. Another is that unless Germany obtains an indemnity she

will not be able to meet her war liabilities. A third is that the Reichstag only passed the Resolution in July because every member of the majority is in the pay of England!

The Voice of Reason

It is refreshing to turn to saner views, and they are propounded in Austria, who is Germany's ally. *Die Zeit* on November 24th, wrote as follows:—

Whoever in Germany thinks that a peace dictated by military force is still possible is dreaming. Fortunately, there are few such dreamers in Austria. These ideas passed muster in the first year of the war; now they are absurd. We had great hopes in those days of impressing neutrals, more especially America, and we sent tons of literature to convince them. To-day, all those neutrals are against us, and hate Germany. Worse still, America has declared war upon us. Another fallacy was that we were independent of the rest of the world. Learned professors tried to make us believe that world commerce was no longer necessary for us, and that Turkey was the great, inexhaustible storehouse whence Central Europe could draw all her raw materials. Egypt was to send us cotton; Anatolia and Mesopotamia grain. Now we see that Egypt has to be reconquered for Turkey; Mesopotamia wrested from the English; and that it is we who have to supply Anatolia with railways. War has made us sober.

Sober, indeed! In an open letter to Tirpitz a "German mother" tells the Admiral roundly that she is not going to join his precious party, enough blood has been shed; it is time to build up a new Germany.

That is the feeling of the masses, and because the German classes are aware of this, they are moving heaven and earth to make their Patriotic Party popular. The masses clamour for peace and bread. Last month big peace demonstrations were reported from Berlin, Vienna, Budapest, Essen, Solingen and other towns in both the Central Empires. At Vienna 30,000, at Budapest 40,000 people passed a resolution demanding immediate peace, without annexation and without indemnities. They expressly declared that they desired all the ravished countries to be completely restored to political independence in order to live their own lives unmolested by their neighbours, that they desired the Central Empires to join a League of Nations, and they called on the Government to take heed to their cry lest evil consequences should follow. "We have had enough of military glory; we now want peace." Speaker after speaker urged these sentiments at the Vienna meeting.

In Berlin the disabled soldiers called a special meeting to pass a resolution in favour of peace by agreement and understanding. These broken men poured scorn on the stay-at-home leaders who were seeking conquests, yet had never once been within sound of the guns.

Amid the growing discontent in Germany, Count Hertling has appeared on the stage as the new Imperial Chancellor, and the old man is faced with no light task. Incidentally, it is curious to note that Germany is governed by old men. The Kaiser is no longer young, he enters his sixtieth year next month; Hertling is seventy-four; Hindenburg seventy; and Payer, the Chancellor's deputy, is also seventy. The new Chancellor has made large promises, yet he satisfies no one. The Reichstag was not consulted on his appointment; the Prussian reactionaries see in him the Bavarian, the Protestants are uneasy because he is a Catholic. But a drowning man clutches at a straw, and the German people, despite their victories, are ready to make the best of the "old fox," as Hertling is familiarly known in Bavaria. The truth is, that the Chancellor has little independent power; he is but a tool of the Militarists, who are the real rulers of Germany.

German Militarism

The following message was made public by the authorities at the Vatican on November 15th:—

The British Minister to the Vatican has been notified by Papal Secretary of State, that after the Austro-German forces entered Italian territory, the papal representatives at Vienna and Munich were instructed to use their influence to induce the authorities of the Central Empires to give strict orders to their military commanders operating in Italy to respect, in accordance with international law, the civil population, especially women, children and the clergy, all hospitals, churches, and private property. The papal representatives were authorised, if necessary, to appeal in the name of the Pontiff, to the Austrian and German sovereigns personally.

What an awful indictment! If there were no truth in the stories of German atrocities, if Germans had not habitually and officially set at nought international law, there would have been no need for the solemn appeal. It throws light on German militarism which cannot be explained away.

The Whitley Councils

By Jason

IT was said in the early articles of the series that the workman wants more than good wages and steady employment; that he wants a place in the sun; such conditions as will enable him to make the most of his life, a new feeling of responsibility for the enterprise to which he gives his energy, and the sense in fine of true and active citizenship alike in industry and in politics.

How far can the Industrial Councils go towards satisfying this demand?

Formerly, industry was regarded as a world of competing units, and the workman as so much labour to be applied here or there, at the will of capital. The war has destroyed the first of these conceptions, bringing into clear relief the importance of substituting some corporate industrial effort for this state of conflict. Industry is learning the use and value of association. If this idea had grown up under other conditions, it might have resulted merely in the expansion of employers' associations into bodies accepted as representing the common interests of the industry. Before the war we had seen a tendency among employers to create large scale organisations for dealing with labour difficulties, and it might have seemed a small step to advance from such an organisation to an organisation that looks after such matters as buying and selling, research and education.

It is fortunate then that this development has taken place under conditions that forbid so narrow a construction. For the war has destroyed the second, and not only the first of these conceptions. The war has made it impossible to treat the employer as the sole representative of industry. In practice the Government have found that they could not carry on the war and refuse to the Trade Unions the right to participate in the decisions and policy for which the Government and an industry are jointly responsible. Where the Government have failed, failure has been due to a reluctance to act on this principle. Where it has been applied, success has been astonishing. The leaving certificate was an example of the method that ignored the claims of the workman and put him in the old and false position; the certificate has been discredited, and it has now disappeared. On the other hand, the Advisory Committee in the Textile Industries, where employers' associations and workmen's unions have co-operated in accommodating the demands of the Army to the needs of the industries, has carried out a delicate operation efficiently and without friction or injustice. The same success has marked the work of the Committees on absenteeism in the Coal Mines, and there is little doubt that the administration of the railways would have gained if the capable leaders of the railwaymen had been given a share in the work and authority of the Railway Committee.

But the most striking application of the new principle has been the inclusion of the Trade Unions' representatives on the Boards controlling the Cotton and the Woollen industries. These Boards have to decide questions of great importance: among others, the granting of licenses for selling and buying, how raw material shall be allocated, what hours and what days factories shall run, and whether a standard cloth shall be produced at a fixed price. It is thus recognised that the workman should have a voice in these questions, and that the old view that he merely had to take the orders of a master, whose business it was to think and act for his workpeople, is no longer tenable. This is an innovation of the greatest significance, as the establishment of a principle. As an actual experiment, it will have great and decisive results, for men cannot sit round a Board and work together without creating a certain atmosphere of custom. Twenty or thirty men meeting every week or every fortnight soon cease to be merely twenty or thirty men. They become some kind of entity; producing a certain spirit and habit of action.

When the members of the Whitley Committee discussed and recommended the policy of creating industrial councils and workshop committees, they could hardly have foreseen the piece of good fortune which the war was thus to bring to their scheme. There might easily have been a disposition to confine these councils to a very narrow set of questions if the world had not had this object-lesson before its eyes. And these Boards are more than an object-lesson. They are a precedent. It would clearly be impossible after the war to turn round on the Trade Union and say: "Yes, we agreed that you should discuss rations, hours, standard clothes and the rest during the war, but you will now shrink into something like one side of a Conciliation Board." The Trade Unions have been called in because the industry was passing through a certain crisis. Peace will not compose that crisis or settle of itself all the issues that the emergencies of the war

have raised. We shall not return in a week or a month to plentiful supplies and normal conditions. The Trade Unions are not going to cease to care about the questions which they have helped to solve. They know well enough that those questions arise, if not in the same degree, in the normal life of industry.

The circular letter recently issued by the Minister of Labour encourages the hope that the Government recognise that the Industrial Councils will be admirably adapted to the task of guiding the nation through the difficulties of reconstruction, and that these Councils are not to be merely bodies for keeping the peace between employer and workman, but the bodies on whose shoulders the main burden of demobilisation will fall. We may remember, in this connexion, that these Councils will start with a great advantage because, during the war, both employers and Trade Unionists have been acquiring invaluable experience. A number of public spirited men in these industries have been giving their time to administrative work, and the Industrial Council will have the benefit of all that they have learnt in surveying the industry as a whole with a view to helping the Government to form estimates of the resources and needs of the future. When we look at one or two concrete questions, we see that this is the only possible course,

Work of Demobilisation

It is obvious that in the actual demobilisation of the army, the most useful agents will be the Advisory Committees that have helped to regulate enlistment. The more completely that problem can be broken up and distributed among such bodies, the better. The work of the Labour Exchanges should be confined to cases that do not come within the province of those committees. We may be sure that the Industrial Council will turn the Advisory Committees that have been at work into its own sub-committees for demobilisation, and that in the case of such industries the work of reinstatement will be done by the industries themselves. Similarly, in the case of the demobilisation of machinery—the restoration of the proper equilibrium of plant—no other body can speak with the knowledge and experience that are necessary.

When these Councils are formed, several leading industries will have representative government. There will be representatives of the employers' associations in touch with their constituents throughout the industry; there will be representatives of the Trades Unions in touch with the district unions, the shop stewards and the workshop committees. It will be possible, by means of such bodies, to settle all kinds of questions on which, at present, we talk vaguely of the voice of an industry without any true knowledge. Take such a question as that of adolescent education. The Lewis Committee heard the evidence of a number of manufacturers, one of whom, now a Minister of the Crown, speaking in the spirit of 1817, declared that the worsted industry would not stand the abolition of half time and compulsory continuation education. To some people that kind of threat sounds very impressive. They forget that the industry is there to serve the nation on the conditions the nation prescribes. The right way, surely, to set about such a reform is to put the Industrial Council to work on the problem of adapting the industry to a change in the law. If these employers and Trade Unionists know that after a certain time the school leaving age is to be raised, and adolescent labour is to be reduced by one half, they will set their wits to think out the best method of substitution. The whole question will be explored; there will be discussion in every mill; an employer here, a workman there will suggest some new contrivance, and the industry will reform itself to meet the new conditions.

Another revolution to be carried out with the aid of such Councils is the shortening of hours. It is generally agreed that the present day of drudgery must be abolished. The workman is going to demand for his own life some of the time that has hitherto been devoted to the workshop or the mill. It was urged in an earlier article that one lesson the war has forced on the soldiers' imagination is the truth that it matters supremely to a man how he lives, whereas it used to be assumed that all that mattered was the amount a man can earn. The soldier who returns to the mill is going to have some of the daylight for himself. In point of fact, the reform of the factory day is long overdue. The last report of the chief inspector of factories laid stress on this, quoting the experience of individual inspectors. One of these reported:

Often we receive complaint of the burden of the twelve hours day, and the strain it is to start work at 6 a.m. A well-known man in a Lancashire town was telling me only

the other day about how he would wake in the morning to the clatter of the girls' and women's clogs as they went past his house at half-past five in the dark on their way to the mills. He had exceptional opportunity of judging the effect of the long day's work, and he told me how bonny children known to him lost their colour and their youthful energy in the hard drudgery of their daily toil.

The most important recent survey of the subject is to be found in an article by Mr. Arthur Greenwood, published in the *Political Quarterly* of September, 1914. Mr. Greenwood pointed out that the normal working day has been reduced by very little for more than half a century; "The ten hours day in textile factories dates back to 1847. The main results of factory legislation have been the gradual elevation of the minimum age of employment, the improvement of working conditions and the wider application of the law. In the meantime, however, industrial processes have been speeded up, the effort required in labour has been intensified and responsibility increased. Machines may be worked at a greater rate or the number of machines tended per operative increased. In other words, though wages have risen in the interval, the amount of effort expended per unit of time has certainly not diminished, but probably in many cases the reverse. There may be industrial processes where the measure of toil of the labourer has decreased, though here the tendency is to supersede those hitherto employed, by younger people. The enormous increase of industrial productivity during the second half of the nineteenth century, therefore, has brought little respite to the worker, though we may admit that many mechanical devices have reduced the expenditure of purely physical energy."

Wanted a New Code

The truth is that the time is ripe for a new universal industrial code, laying down certain minimum conditions for all industry. The distinction between textile and non-textile industries is an historical anomaly, and there is no point in keeping it. There is no conceivable argument to-day for having a maximum working week of 55½ hours in a textile factory for women or young persons, and a maximum working week of 60 hours in a non-textile factory. Why should there be a 74 hour week for the shopworker and no limit at all for the van boy? Why should the domestic servant be entirely unprotected while her sister who works in a factory, comes under special laws? Mr. Greenwood estimates that half the occupied persons in England and Wales are outside the industrial code.

We have tinkered with factory law and industrial law, making little extensions here and little rectifications there. The next step must be bolder and simpler; the creation of a comprehensive code applying to industrial life everywhere, regulating the working week, and providing security against disease and danger, forbidding certain practices, such as the employment of boys at night, and controlling other abuses whether of mill or workshop, or of less organised occupations.

Incidentally, it may be urged that a serious effort should be made in the international deliberations that will follow the war to secure a decent industrial minimum in all countries. The International Association for Labour Legislation was working at this subject for many years before the war, and not without success in certain directions, for common action was taken by different Governments on the questions of the employment of women at night and the use of phosphorus in the making of matches. Unfortunately, the results of the last official conference, held at Berne in the autumn of 1912, were disappointing, for there was a general disposition to take the worst rather than the best standard as the normal. Our own delegates were no exception. Thus in the case of night work for boys, on which we had had a year or two before an inquiry in this country, and the apologists had argued that we could not afford to be more sensitive than our competitors, the Conference accepted the bad practices of Germany and Italy, and thus gave an official sanction to those practices. At the end of the war we may hope for sufficient democratic pressure in all countries to obtain a general improvement, though our law will no doubt be stricter than the code laid down for international use.

In the working out of an Industrial Code the Councils will have an important and responsible task, for it will be their function to see how best each industry can be accommodated to the new arrangements. The law will, perhaps, prescribe a maximum working day of eight hours, making a working week of 44 hours. The different Industrial Councils will discuss the most convenient method of arranging that week. There are strong arguments for abolishing all work before eight in the morning. Before the war, there were experiments on these lines in many textile factories round Glasgow, and manufacturers there recorded a great improvement in time-keeping and quality of work. Another interesting experiment was made in the linen weaving sheds of Dunfermline. There

were ten factories, employing between four and five thousand workers; chiefly women. The workpeople came largely from the surrounding country, and in some cases they had to start as early as four o'clock to reach the mill at six. At the instance of the workpeople, the employers instituted a new working day: 8 a.m. to 5.30 p.m., with a break from 12.30 to 1.30. The weekly total of hours was thus reduced by 15 per cent.; a 5 per cent. rise was granted in piecework rates and the time workers were given their old wages. The Factory Inspector reported in 1914, that some of the pieceworkers had lost in wages, but that the workpeople were entirely in favour of the change, though the employers were not unanimous.

The Weekly Holiday

It may be, on the other hand, that the workpeople in a particular industry may prefer some other arrangement. It is believed that the alternative method of taking a weekly holiday, adopted during the scarcity in the textile industry, is more popular with the workpeople concerned. Different arrangements might be chosen in winter and summer, for it is working before sunrise that makes the early start such a hardship. At any rate, we may take it that the long day, which swallows up a man's life, is going to disappear, and that the working hours of the future will be very different. Each industry through its council will be able to formulate the views of employers and workpeople, and the workshop committees will be able to make the arrangements that suit different workshops. Meanwhile, the industries that employ boys at night can be called upon to devise some satisfactory alternative.

Take, again, the question of insurance against unemployment. The method of compulsory contributory insurance through the Board of Trade is clearly wrong in principle. If we want to realise how perverse it is we have only to remind ourselves that not long ago there was a strike because the workpeople found that without their knowledge, their industry had been scheduled under the Act. In other cases, Trade Unions have had to present their statistics to make good their contention that the Act ought not to be extended to them, to resist, in fact, a form of special taxation. The only good provision in the Act was the provision that enables Trade Unions to claim from the State a certain proportion of the amount they spend on out of work benefit.

The Industrial Councils will be able to thresh out different methods of making provision against unemployment, and each council will have the advantage, both in this and other respects, of the experience gained in other industries. Thus, there have been arrangements in force in the dyeing industry during the war under which employers and Trade Unions combine in providing out of work benefit. Two important features are to be found in these arrangements. The workman has practical security of tenure and the Trade Union acts as the Labour Exchange for the industry. An employer, that is to say, reports his vacancy to the Union, and the Union fills it. It is clear that if these councils act with the vigour that may be expected from bodies of responsible men entrusted with important duties, a great part of the work of the Labour Exchanges will pass into the hands of the Unions. This is all to the good. And for such work as is left to the Labour Exchanges, it is important to bring the Trade Unionism into closer and more responsible touch with the administration of these offices. Mr. C. M. Lloyd suggested in his interesting book on *Trade Unionism* (A. and C. Black) that the management of the Exchanges might gradually be brought under their direction.

Arrangements such as these will go some way to break the tyranny of a system of which workmen and many who are not workmen are painfully aware in the present industrial world. Men will be putting their minds together in each industry in the effort not merely to make the industry more efficient, but to give power and effect to the wills of the men and women engaged in it; to discover how, in the phrase of one of the victims of the early factory system, the workman's life can become a pleasure to him. And when the Trade Unions take a direct and conscious share in the control of that industry, acting not as the servants of capital, but as accredited representatives of the producers, a new self-respect will take the place of the sense that he belongs to a subject and exploited class which has haunted the workman mind since the catastrophe of the Industrial Revolution.

Not, of course, that these benefits will follow automatically from the adoption of the recommendations of the Whitley Committee. These recommendations are necessarily vague and indefinite. Each industry must work out its own salvation and construct its own schemes. We cannot say more for the settling up of Industrial Councils than that these Councils will provide an opportunity; it will depend on the use made of that opportunity whether the next chapter in our industrial history is to be a chapter of progress.

The Finance of the War

By Harold Cox

IN the first War Budget which was submitted to the House of Commons Mr. Lloyd George, who was then Chancellor of the Exchequer, made an eloquent speech on the necessity for raising a very large proportion of the cost of the war out of revenue to avoid the disaster of having to impose fresh taxation in time of peace to meet the burden of war debt. He followed up this appeal by proposals which in the then current financial year, 1914-15, did not provide even sufficient additional revenue to cover the anticipated falling off in revenue owing to the war. The following May Mr. Lloyd George produced a second War Budget, and made another speech on the necessity for immediate financial sacrifice on the part of those at home in order partly to balance the sacrifice of those who had gone to fight. Mr. Lloyd George apparently thought that these excellent sentiments alone sufficed to meet the whole financial situation, for he proposed no further additions to taxation.

After that nothing was done for many months, though the City of London and many private people pressed the Government to take adequate steps to deal with the finance of the war. It was not until September 1915, that the new Chancellor of the Exchequer, Mr. McKenna, introduced a new War Budget. The country was then fully prepared for a very high rate of taxation. An income-tax of 5s. in the £ was anticipated; Mr. McKenna proposed 3s. 6d. His other proposals, though immensely in advance of those of his predecessors, were still inadequate. His first Budget was, however, followed by a second Budget in April 1916, which made good some of the deficiencies of the previous September. The two together raised a very substantial volume of revenue. The income-tax was brought up to 5s. in the £, with corresponding additions to the super-tax; the scale of exemption was lowered from £160 to £130, so as to obtain a very considerable increase in the number of income-tax payers; and above all there was established the Excess Profits Duty, which has proved one of the mainstays of our war revenue. In the current year, without the addition of 20 per cent. to the rate made by Mr. Bonar Law in May last, the Excess Profits Duty, as established by Mr. McKenna, is estimated to yield £180,000,000. In addition, very considerable increases were made in September, 1915, and April, 1916, to some of the taxes on popular forms of expenditure.

Apart from Mr. McKenna's two Budgets, practically nothing has been done to give effect to the principle so eloquently laid down by Mr. Lloyd George that the present generation ought to provide, out of current revenue, a substantial portion of the cost of the war. Instead, during the past twelve months, the Government has been pursuing a policy which has greatly added to the cost of the war, while at the same time encouraging unnecessary private expenditure. This statement does not refer only or primarily to the hideous waste involved in the needless multiplication of Government officials. It refers especially to the policy of financing the war by means of currency inflation instead of out of the savings of private individuals obtained either by taxation or by borrowing. For reasons which it is impossible to explain in detail here, when the Government borrows through the Bank of England or through private bankers, the process tends to expand the effective currency of the country, and by thus making more money available tends to force up prices. The same results ensue when the currency is inflated through the issue of currency notes. The public generally has not yet observed that nearly £200,000,000 currency notes have now been issued with an extremely meagre backing of gold. By making money cheap the Government makes commodities even dearer than they would have been if the currency had not been inflated.

Equally mischievous has been the way in which the Government has dealt with the claim of wage-earners for additional wages to meet the additional cost of living. This claim is a thoroughly sound one so far as the poorer wage-earners are concerned. It would be a cruel thing if while the country taken as a whole is extremely rich, the very poorest classes should be reduced almost to starvation point by the rise in the cost of living. This problem ought to have been met, and has indeed partly been met, by dealing specifically with the very poor. Old-age pensions have been increased by 50 per cent., and in certain branches of the Civil Service the lower wages have been raised, while leaving the higher wages as they stood before. A minimum wage has been decreed for farm labourers. Unfortunately, this sound principle has not been followed in dealing with large bodies of workpeople—munitioners, miners, and railwaymen. In their cases the increased cost of living has been met, not by giving the largest bonus

to the poorest persons who suffer most, but by giving a bonus in the shape of a percentage on wages, with the result that the best paid men get the biggest poverty allowance. The result has been an enormous and entirely unnecessary increase on the civilian side of the cost of the war.

Limiting Prices

Equally serious in its results has been the policy adopted of trying to limit prices. Even to a politician it ought to be obvious that when supplies are falling short, the sound method of dealing with the situation is to allow prices to rise as high as they will, both in order to check consumption and in order to stimulate production. The resulting hardships to the very poor can and ought to be dealt with as above indicated by special measures on their behalf. The well-to-do, whether they be wage-earners with increased wages or professional men with reduced incomes, ought to be content to face the increased cost as part of their share of the burden of war. For if the other method—the method of the Government—is followed, the inevitable result is to increase consumption and reduce production, thus aggravating the evil. The shortage from which we are suffering to-day, and which will probably be followed by a still greater shortage in the near future, is partly the result of the policy of checking prices in obedience to popular outcry, and regardless of the true interests of the nation.

The truth of this proposition is plainly visible when we look at articles of home production like milk. The reduction in the output of milk is the direct result of the folly of the Government in fixing milk prices at so low a figure that farmers prefer to sell their cows rather than to go on producing milk. The same sequence of cause and effect, though less clearly visible, has been operative in commodities imported from abroad. It may be added that this policy of price limitation has not even achieved a paper success, which is perhaps the only kind of success its authors hoped to secure. In a recent speech in the House of Lords, Lord Milner chanted a song of triumph while describing the achievements of the Food Controller in the previous three months in bringing down the general average of prices by some minute percentage as compared with the earlier figure. When, however, at the end of the debate he was challenged to justify his figures, he had to confess that the whole of the average reduction which he attributed to the achievements of the Food Controller, was, in fact, attributable to the expenditure of £40,000,000 out of the public exchequer in artificially lowering the price of bread. It is a big price for the nation to pay in order that a Minister may boast of a fractional reduction in average prices.

Undoubtedly the Government was compelled to deal with the political situation created by the outcry against "profiteering," an outcry largely stimulated by some of the members of the Cabinet. But the right way to deal with that problem would have been to examine, through the mechanism of the income-tax and the excess profits duty, the profits made by all dealers in food, wholesale and retail, and to compel them to yield up to the State the greater part of what would otherwise flow into their private pockets as a result of the economic situation created by the war. If this course had been pursued, the rise of prices would have checked consumption; it would also have increased production; and it would in the third place, have yielded a large revenue to the State, more than sufficient to cover any necessary allowances to the poorest classes.

Owing to the fact that the Government has preferred popularity-hunting to sound finance, the financial situation of to-day is perhaps worse than at any period since the war began. Mr. Bonar Law makes repeated statements to the House of Commons, in the course of which he reels off multitudes of figures which do not tally with one another. But he has done nothing more. During the twelve months that he has been Chancellor of the Exchequer, the daily expenditure upon the war has increased by well over a million pounds a day, probably not less than £300,000,000 a year; towards meeting this increase Mr. Bonar Law has provided extra taxation which he estimates will yield the miserable sum of £26,000,000 a year.

As to what is the proper proportion of war expenditure to be met out of current revenue as compared with that raised by borrowing, interminable discussion is possible. No final conclusion can ever be reached because no solid basis exists for forming a judgment. But this can be said with confidence, that as a war continues the amount of money to be raised by taxation ought progressively to be increased. In the early days of war a very high scale of taxation might

destroy so many peace industries as to reduce the revenue yielding capacity of the country; but as war goes on peace industries are converted into war industries, peace profits become war profits, peace wages become war wages. There is consequently no fear of industrial destruction by high taxation. The whole problem becomes one of temporary sacrifice as compared with the postponement of liabilities.

We ought all of us to be prepared to make a higher sacrifice to-day in order that the nation may be in a stronger position for meeting the very serious economic difficulties which will have to be solved when the war ends. It is possible greatly to increase the income-tax and at the same time to extend it

to every class in the community, so that even the poorest may make some direct contribution to the cost of the war. In addition, it is possible to increase very largely the taxes on various forms of expenditure so that the money now spent upon private satisfactions may be available instead for public needs. There is no reason why these steps should be delayed to some arbitrary date which Mr. Bonar Law may fix for his next Budget.

We want an increase at once in the public revenue and a decrease at once in private expenditure. A Government which refuses to take these steps through political cowardice or any other motive, is not serving the interests of the nation.

The Pen-Wiper

By Etienne

ONE day, several months ago, in the parlour of a small inn situated in the north (one must not be too precise), several naval officers had congregated together. Two years ago this little inn had been on its last legs in a financial sense, but then came the war, and with it the fleet, and ever since that day, whenever the ships were in harbour, naval officers had met together at the inn "Northern Lights."

The "Northern Lights" is a very snug little house, stoutly built in grey stone, and from its porch it is only a stone's throw to the small pier (built by local labour, under the direction of an engineer-commander), against which the picquet boats and sailing launches and pinnaces jostle each other when waiting for their cargoes of officers and men who have been ashore for a few hours' exercise. So it is that officers waiting for their boats gravitate naturally to the "Northern Lights," and study in a contemplative manner the Defence of the Realm Acts, and "Board of Liquor Control Regulations."

It was blowing half a gale, and the Scotch mist was rolling across the moors like puffs of damp smoke; when I turned into the "Northern Lights." Only a few enthusiasts had "taken the beach." I took off and hung up a dripping oilskin, and entered the parlour. There were three other fellows in there sitting round the fire. One was a marine whom I did not know, and the other two were friends of mine, R—— and P——, both lieutenants from one of the battleships.

"By Jove, it's perishin' cold," complained the soldier, "seems to grip one after East Africa," he murmured, as if in extenuation of his complaint.

"When did you come home?" said R——

"Middle of June," replied the marine.

"The Huns are pretty well enchred out there, aren't they?" said R——.

"Oh, rather, Smuts had put the kybosh on them all right, they were getting ready to have a beano for the homecoming of the victorious warriors at the Cape when I passed through," answered the soldier. "Sickening bad luck I had in not coming home earlier, I missed the stunt on the 31st*"

There was a lull in the conversation. We three had not missed "the stunt on the 31st," and though some months' old, mention of that date evoked memories.

"Talking of the 31st," said P——, "I only realised the other day that 'The Pen Wiper' was scuppered that night."

"Whom did you say?" I asked.

"The Pen Wiper," repeated P——.

"Who the devil was that?" enquired R——.

"Why Jimmy X——, of course. D'you mean to say you didn't know he was called the 'Pen-Wiper'?"

We expressed our ignorance of this fact, and demanded the tale which we knew must be attached to this name.

"I think," said the soldier, "a very small drink wouldn't do us any harm." Suzie McHamish entered in response to a knock of a stick on the wooden floor. "Three small whiskeys and water and a lemonade," said the soldier.

"EVERRY offeecer must pay for his ain drinks," sternly remarked Suzie, then, as she saw the clock, which pointed to 5.50 p.m., "Whishts, and it's no yet six o'clock, so ye canna ha' whuskey the noo."

"Quick, R—— exert your well-known fascinations or we are undone," I whispered.

"My dear Miss McHamish," interposed R——, "how often have I warned you that the affection which exists between us will be fatally marred by this slavish adherence to those regulations." And he pointed to the "Liquor Control" rules. "Come Suzie, for two years you have sinned at 5.50 p.m. for my sake. Why this sudden coyness? What is ten minutes of time? And our boat goes at——"

"Ah, weel, Mr. R——, ye ken verra well it's no lawfu' but I s'pose I maun get them for ye."

With a complacent smile, R—— filled and lit another pipe, as P—— began his story.

"It was in 1908 I first met him, I was a sub in one of the boats of the North flotilla, based at Portland. Jimmy had just got command of the 'Sharper'; he commissioned her at Pompey, and when he brought her round to join up with the flotilla, we all thought him a devilish lucky fellow. He only had six years in as a Lieutenant, and was the youngest skipper in the flotilla. But he deserved his command. I tell you Jimmy was one of the smartest destroyer officers in the old Home Fleet. The way he handled that boat was a revelation to the whole flotilla. There was no doubt about it, he was red hot. Of course, some people said he was reckless, and so he was in a way; but, after all, what good destroyer officer hasn't got a bit of devil in him? Jimmy had his share all right. When he'd just shipped two stripes, they gave him a command in the Devonport torpedo boat flotilla. Old Arthur Hillow was the commander of his division, and was a bit of a taut hand. One night they were exercising off the Eddystone, and Jimmy's boat began to flame at the funnel—you know what devils at doing that those old coal-boats were; when they got in next morning, Hillow sent for Jimmy and scrubbed him down over this. Next time they went out, to the joy of the division, old Arthur's boat began to flame. Jimmy saw this, and though they were going 20 knots, he brought his boat up to within about 10 yards of the divisional leader.

"What the deuce are you doing, you reckless young fool?" sung out Arthur through a megaphone.

"Please sir, I've only come to make some toast," says Jimmy in reply as he hoisted out a ship's loaf on the end of a 20-foot boathook. No one else could have done it without being court martialled, but it shows the kind of fellow he was.

Well, as I was saying, he joined up with our flotilla in 1908, just about the time they started the idea of putting destroyers into "pens" instead of mooring 'em in the stream. We used to lie two deep in the Portland pens, and whenever Jimmy was outside boat, it was the dickens to pay for the bloke inside him. Jimmy would come in at half speed, dodge half a dozen dinghies and a couple of buoys, miss the entrance pier by inches, and inside of five minutes he'd be tied up, head and stern.

He had a mania for running things fine, and fellows swore that his boat had a smaller turning circle and less beam than any of the others, but, of course, she was sister to them all. Naturally he often had small bumps, and he thought nothing of removing every wooden outside fitting from the boat he was running alongside. If you left anything sticking over the side it was a "dead bird" if Jimmy was due to double-bank you in the "pens."

He always sent his artificer over at once. "With Captain X——'s compliments, and if 'e done any damage, 'e 'opes you'll let me repair it, sir."

"Done any damage," shrieked an infuriated gunner, one day in which he was a helpless spectator whilst one of his sighting hoods was neatly split in twain by a bridge rail, as the *Sharper* shot past. "Done any damage? Why your captain's a blinkin pen-wiper—that's what 'e is!"

The name stuck, and no one relished it more than Jimmy himself.

I never saw him again since those days, but I heard about him after the action. It appears that he fired his last torpedo at a range of 200 yards, with about a dozen searchlights, and Lord knows how many six-inch on him. Last thing seen of him, his boat was disabled—bumping down the side of a German battleship. If I know anything of him, the "Pen-Wiper" wiped the Huns that night. He always did get where he wanted to.

"Pity he's gone," said R——, "blokes like that are useful the night after a fleet action."

"Yes," agreed P—— as we rose to battle our way down to the pier and its waiting boats, "but there are still some left like him, thank the Lord."

Life and Letters

By J. C. Squire

The Somme in Retrospect

MR. JOHN MASEFIELD'S *The Old Front Line* (Heinemann, 4s. 6d. net) is an account, not of the whole of one of our successive fronts in France but of that section upon which was opened the struggle which we know as the battle of the Somme. He has been recently over the ground from the neighbourhood of Hebuterne southward to the Somme River, and he conscientiously takes us along it, describing every important position in detail and giving a brief account of the fighting at each spot. At the beginning of the struggle "the enemy had the lookout posts, with the fine views over France and the sense of domination," whilst our men looked almost invariably uphill with, often enough, a German parapet or some great redoubt as a sky line. The country is a country of chalk hills and terraces and little valleys with the familiar chalk streams in them. It is difficult to describe a series of chalk ridges, and avoid monotony; chalk is chalk, and there is no passable synonym for it, a hill is a hill, and it is no good hunting for a hundred different ways of naming it; but Mr. Masefield has a good eye for the lie of land and succeeds remarkably well in differentiating the respective positions. In so far as it is a survey of the ground, with a view to formulating the various natural and artificial obstacles that the British Army had to overcome, the book is very well done.

* * * * *

So vast were these obstacles and the endeavour which overcame them, so tremendous the scale of the fighting, and of the issue involved, that even the baldest account must be impressive. Mr. Masefield is usually content to be bald, and his plainest descriptions—though they have not that final grip which is achieved by a man to whom a simple bare style is completely natural—are remarkably well done. Where he lays himself out for a purple patch—though, in this book, there is nothing, perhaps, of that unbridled luxuriance which demands the term "purple"—he is less sure of his effect. Frequently there is a little phrase of the vivid journalistic kind done with more than ordinary force. "At the top of the hill, in the middle of a filthy big pool, is a ruined enemy trench-mortar, sitting up like a swollen toad"; we are vaguely conscious of having seen it before, but it is done this time by a genuine artist. The same may be said of his gruesome description of the mine crater of Beaumont Hamel:

It is like the crater of a volcano, vast, ragged and irregular, about one hundred and fifty yards long, one hundred yards across, and twenty-five yards deep. It is crusted and scarred with yellowish tetter, like sulphur or the rancid fat on meat. The inside has rather the look of meat, for it is reddish and all streaked and scarred with this pox and with discoloured chalk. A lot of it trickles and oozes like sores discharging pus, and this liquid gathers in holes near the bottom, and is greenish and foul, and has the look of dead eyes staring upwards.

His accounts of Redan Ridge and the Schwaben Redoubt, too long to quote, are the best one has seen, and could not easily be bettered; and he has a very effective peroration describing the opening of the battle and the nerve strain of the enemy under that bombardment that seemed never to be going to end. But though the book is far above the average of such it has a fault which goes far to spoil it. One can see the author deliberately assuming a literary attitude at the start and deliberately employing artifices—without that art which conceals them—to play on one's sentiments. That, even civilians who were safe and warm all the time, must dislike. Mr. Masefield was no doubt unconscious of what he was doing. He was merely anxious no doubt to "rise to the height of his great argument," and he has obviously expended great pains upon his language. But the most violent bombast would have been less out of place than the prettifications which have sometimes successfully whispered in his ear.

* * * * *

"All wars end," Mr. Masefield observes, "even this war ill some day end":

The ruins will be rebuilt and the field full of death will grow food, and all this frontier of trouble will be forgotten. When the trenches are filled in, and the plough has gone over them, the ground will not long keep the look of war. One summer with its flowers will cover most of the ruin that man can make, and then these places, from which the driving back of the enemy began will be hard indeed to trace, even with maps. It is said that even now in some places the wire has been removed, the explosive salvaged, the trenches filled, and the ground ploughed with tractors. In a few years' time, when this war is a romance in memory, the soldier looking for his battlefield will find his marks gone. Centre Way, Peel Trench, Munster Alley, and these other paths to glory will be

deep under the corn, and gleaners will sing at Dead Mule Corner.

The passage illustrates some of the merits of Mr. Masefield's now much chastened style; and especially his real efforts to be straightforward and simple. Look for the adjectives in it and you will have to look hard. It also illustrates some of its defects, a faint aroma of false sentiment and an inclination to the easy picturesque; for one cannot but suppose that to this rapidly passing official tourist Dead Mule Corner was no more than other places, and that the name's forcefulness and rhythmical suitability for a sentence's end alone determined its selection as a place where gleaners would sing—if, indeed, they do sing, and if gleanings are encouraged in that locality.

* * * * *

Affectation of language—cold-blooded use of "poetic" phraseology in a deliberate and accurate narrative of facts and in places where the emotion that may compel and carry home such phraseology is not communicated—is the chief fault of the book. Take, for instance, the end of this:

Then, too often, to many of them, the grass that they were crossing flew up in shards and sods and gleams of fire from the enemy shells, and those runners never reached the wire, but saw, perhaps, a flash, and the earth rushing nearer, and grasses against the sky, and then saw nothing more at all, for ever and for ever and for ever.

"The genius of prose," says Stevenson, in his *Elements of Style*, "rejects the *cheville* no less emphatically than the laws of verse; and the *cheville*, I should perhaps explain to some of my readers, is any meaningless or very watered phrase employed to strike a balance in the sound." Here it is the last "for ever"—you may even add the other two, "for evers"—that gives the show away. In adding those words, Mr. Masefield was not thinking of rendering with accuracy the event he was describing, or his own emotions about it—with either or both of which the artist may properly be concerned—but merely of the rather minor tune he was playing. You find a kindred falseness in his use of certain phrases which might come naturally from another but do not come naturally from him. "On all four roads many men of our race were killed"; "men of our race died in our cause in every village within five miles of the front"; "All through that day little rushes of the men of our race went towards that No Man's Land"—and so on. The locution comes in quite properly elsewhere, though most people would incline to say "Englishmen" or "British soldiers." Frequently there are touches that suggest too recent—if the adjective may be excused—reading of Mr. Belloe's prose. One would not, of course, labour these small points were one dealing with the work of an ordinary war-correspondent; and one is not forgetting that the Battle of the Somme was the Battle of the Somme, and that a weak sentence is merely a weak sentence. But Mr. Masefield is a serious artist; he set out a year after the events he records to write a narrative which would be of more than ephemeral interest; and it is right that one should indicate those defects in his temper and in his approach—his tone throughout, I may add, is rather that of one who writes of "old unhappy far-off things"—which make his book less good than it should be. Whether anyone at all could, at this date, go over the ground of the Somme with a notebook, determined to produce a masterpiece of reminiscent description, and succeed, may be left an open question—though, to my ear, only one answer comes. Bookmaking is bookmaking, even when the author is a serious and sensitive artist, and even when the subject which he selects is one in which his deepest feelings are involved. After a generation or two, when the war really is what Mr. Masefield calls "a romance in memory," some stray traveller, striking the old Somme line by accident, may be tempted to follow it up, to reconstruct scene by scene what happened there, to let his imagination lead him wherever it likes and formulate what contrasts and comparisons it may. Drawn into the thing in this way he may write an immortal book. The man who goes out to do it now, whatever his qualifications, will not.

Youth at Four Score Years

By Francis Stopford

EVEX at this hour it is hard to rid the mind of the illusion that man gains a larger measure of life through the practice of words, spoken or written, than through action. Not seldom is he believed to have done a greater deed if he shall have spoken a speech or written a book which has gained him the praise of his generation than if his life has been spent in quiet service to his neighbour. It is an illusion easy to understand, and it is one that will die hard, for it is nursed and fostered by most of those—not all—have the command of the public ear. This biography* will help to correct the false illusion, for here we have the life-story of a man, eloquent with tongue and pen beyond his fellows, a personality of commanding presence and singular charm, many of whose days were spent in the company of famous writers and artists, yet as we read his letters and the salient incidents of his progress from the youth of boyhood to the youth of old age, these gifts and privileges sink into insignificance, and there comes to meet us the man of action, "of radiant vitality," who lived life to the last hour, and at fourscore years and four, still vigorous in mind and soul, entered into immortality with serene faith and confidence.

The one incident which during the latter years of his life was always popularly associated with the name of Stopford Brooke, was his secession from the Church of England. He never attached himself to any other religious body, but inasmuch as afterwards he usually preached from Unitarian pulpits, the main cause for his action was generally understood. There is no intention to pursue this episode; it is treated simply and straightforwardly in these pages; and we are told that, after having taken the step, in all his pulpit utterances, he "dwelt continually on the Fatherhood of God, the leadership of Christ, and the Immortality of the Soul." This is borne out by many passages in his letters, especially those written during the war. Speaking to him a few years ago about certain articles on the Higher Criticism that were then attracting attention, the present writer asked him whether he had read them. "No," he replied quietly, "I never read such articles nowadays; I have come out on the other side." One needs to have seen the look on his face to understand the words at their true value. He spoke as an Agonistes; he had had his struggles; he had wrestled honestly; his bout was over; he awaited the award.

Lord Bryce, in the brief appreciation contained in this volume mentions that "vivid and suggestive and full of good things as Stopford Brooke's letters were, they do not convey an impression of the charm his conversation had." It was, indeed "a charm" in the fullest meaning of the word, as one realised who had listened to him holding enthralled by his conversation representatives of two and three different generations. A large part of the secret was that his words always reflected life; they were as sparkling as the running waters that entranced him, and were as full of brightness and changing colour as the bow that glistens in the spray above the waterfall. To quote his biographer:

As he entered upon old age there came to him a renewal of youth in the inward man. In the old age of Brooke hope was more active than memory; it was one of those sunsets which resemble the dawn. . . . He spent the last years of his life in reaping the harvest of his soul, in the enjoyment of the spiritual vision which was his reward for a lifelong quest of ideal beauty and for half a century of self-forgetful work. He had come to the goal of his desires, which was to love and to be beloved; and there like a traveller unexhausted by his journey, he sat down by the waters of life and lingered, looking to a beyond, it is true, but to a beyond which is not of this world. . . . He was intensely alive, very near to those by whom he was beloved and very near, as it seemed, to God. His form was unshrunk and unbent; his voice full and clear, his face still radiant and his eye undimmed. The majesty of old age which comes from the close contact with eternal things was his, but youth lingered in his heart. His conversation retained its eagerness and versatility, and his playfulness was ready to break forth at a touch. The last time I saw him, which was two months before his death, he was little changed. He talked much of his garden and said with a smile: "I wonder if I shall live to see the roses bloom again." He was full of what I can only describe as a solemn gaiety, and spoke of Death as the Great Romance.

Who is there who would not desire such an old age if length of life be granted—not to "bring our years to an end, as it were a tale that is told," but as the close of the preface to the Great Romance.

* *Life and Letters of Stopford Brooke*. By Lawrence Pearsall Jacks, Principal of Manchester College, Oxford. 2 Vols. (John Murray 19s. net).

"We glance eagerly through these pages to try and discover the secret of perennial youth, and we seem to catch more than a glimpse of it in the active, sympathetic, and virile mind that informs these letters. Stopford Brooke was never a weakling; he could hit hard, and he did hit hard on occasion. His enthusiasms were intense and his impulses strong. In early years he declared that "our Liturgy needs a new clause: from all manner of fools, good Lord deliver us." A deep impression was made on him in his first London curacy by a visit to a poor woman dying of cancer. "She describes the pain as if someone with claws were scraping all her bones against the grain, and yet she is as peaceful and as calm as a summer sea, only reproaching herself a little for want of patience. It is these things that make a clergyman feel that there is reality in Christianity." A year later he writes in his diary: "I am more and more impressed with the thought that Christianity is the ultimate and only religion for man. . . . It accepts the facts of Humanity." This biography gains immensely by the new outburst of faith which the war has evoked, and which has revealed hidden springs behind the flinty face of our national character, hardly suspected by many. There are constant passages in the letters which will be read gratefully by many to whom Stopford Brooke was only a name. One of his favourite doctrines was that "the supreme duty in life is to make other people happy," and he succeeds in this duty though his mortal life be ended.

"All children were his natural kinsfolk and his fondness for them increased with years." Of his own family life we are told, "his children depended on his love, but equally he depended on theirs. He craved for the support of loyal hearts, for sympathetic understanding, for the answering look, word and deed. And throughout his life he was singularly fortunate in having those about him who gave his nature all that it needed of these things." And being fortunate in this respect, he was generous and he gave sympathy and love as freely as he had received. "The sanctity of the home" has degenerated into a phrase which is often either a mockery or of little meaning, but one sees it here restored to its pristine lustre, to a sanctity of which the very essence are joy, freedom and beauty. When children are young the parent labours under frequent misunderstanding which may lead and does lead with certain temperaments to rifts that only widen with years. But if there is patience as well as love, then all is well, and the rest is happiness.

Stopford Brooke won a high reputation as a critic of letters, and there is one passage of criticism which calls for citation, not to illustrate the critic but the man. It was written at the time when the decadent craze was at its height:

O, how tiresome these poets, whose Goddess is Decay, are to me. They turn the world into a Lazaretto, and it isn't anything of the kind. They are too lifeless to celebrate life, too weak to write of anything but weakness, and their weakness makes their cruelty. Feeding on disease, they deepen their own disease. And the more it deepens, the more active, like a heap of writhing worms, becomes their self-contemplation. So they are wholly lost souls in this world. They will find themselves again hereafter, and will be spanked into life by the four Winds of the Spirit—a painful business for them, but the Gods won't have Decay and Death in the Universe of the Spirit.

"Of all experiences which quickened the imagination of Brooke or enabled him to apprehend directly the life that is in nature, the sight or sound of running waters was always chief." This innate devotion appears to have been strengthened by his own surname, and we are told that he almost believed at times he enjoyed the peculiar companionship of an elemental water-sprite or Naiad. "The fact is unquestionable that from boyhood to extreme old age the presence of running water had upon him the virtue of a spell." Others have the same feeling, though not so acutely marked. It may be argued that it is a survival of man's prehistoric evolution through the fish, still, so it is said, traceable in the embryonic state. But it may be that in running waters the imaginative mind unconsciously recognises the truest representation of the human mystery. To speak of running water as weak and unstable is foolishness; it is the strongest and most durable force in Nature. Stained with the impurities of the soil, in its progress it frees itself from these; it is of the earth earthy, yet of such purity that it is caught up to the heavens. Bridges fall into ruins; cities sink into decay, but the river flows on, knowing neither ruin nor decay. Stagnant water is death; running waters are the truest symbol of human life and the soul's immortality. It is small wonder that they should so play on a vivid imagination until the man comes to believe he is a very part of them.

- Cheerio.** Some Soldier Yarns. By J. FREDERICK TILSLEY. W. and R. Chambers. 2s. 6d. net.

TRADE, wholesale and retail, henceforth owes a special debt of gratitude to Mr. Gordon Selfridge, for he has gone to the libraries of all nations and taken from them golden passages to add glory to the *Romance of Commerce*. And this volume he has adorned with a gallery of old prints, so that the illustrations in themselves are a valuable contribution to his subject. The obvious criticism is that trade and commerce are treated too cursorily in its pages, that the book itself is too much of a compilation; but this criticism the author himself anticipates in the very opening sentence of the first chapter: "To write on commerce and trade and do the subject justice would require more volumes than any library could hold and involve more detail than any mind could grasp."

In fairness to Mr. Selfridge we must not dwell on rather obvious omissions, but we do regret that as he could find space for a chapter on the ennobled families of these islands who owe their origin to trade, he did not also include a list of the splendid benevolences and endowments which have their source from the same fount. Has ever a merchant uttered a nobler prayer than that of Sir Thomas Sutton, founder of the Hospital and School of the Charterhouse: "Lord, Thou hast given me a large and liberal estate, give me also an heart to make use thereof."

The chief perplexity of British public opinion towards trade and commerce lies in the curious distinction which is drawn between wholesale and retail trade. To this day in the outer parts of the Empire, the wholesale merchant who sells, say, whisky by the dozen, is eligible for the leading Club of the station, while the retail merchant who sells it by the bottle is *ipso facto* debarred, notwithstanding that the latter personally may be of better birth, higher education and a pleasanter fellow all round than the former. This attitude is the outcome of tradition, but the present writer has never been able to ascertain any sound reason for the tradition which has taken such strong growth on a nation which has never allowed outstanding merit to be barred by birth or origin though it has often sneered at both.

* * * * *

Mr. Gordon Selfridge's work has two outstanding virtues; it is thoroughly readable from cover to cover, and it is mentally stimulating. It does force attention on trade and commerce at a time when it is badly needed, and he does provoke thought, which leads, as with this writer, to criticism and reflection. The final chapter will be read with peculiar interest, in that it tells of the organisation of "a representative business of the Twentieth Century." Here we know the writer is thoroughly at home, and it is instructive to get a glimpse of the secret complicated works of a great general store. The question, of course, arises whether the General Store, which will take charge of a civilised being and provide him or her with everything each needs from the cradle to the grave, even though life be extended to four-score years, is good for a nation. Does it or does it not tend to convert the multitude of workers into machines, and to reserve initiative and the cultivation of mind and imagination for the few? In other words, is not the Great General Store liable to become a "commercial militarism," and to deaden democratic development?

We are told at the outset that this book was practically written before the war, otherwise we might have looked for a chapter on that very irritating and sore subject "profiteering." It may be that here is the very thing which has given birth to the illogical contempt of retail trade to which we have referred. The retail trader is brought into direct contact with the consumer, and when times are out of joint and out of a good many other things as well, he is apt to be made the general scapegoat for all the sins and failures of trade and commerce. However, on the whole, he bears his burden lightly, and he has not much cause for complaint.

For commerce has this glorious advantage, that it is regally generous to its favourites and to those of its subjects who succeed. The playwright, William Shakespeare, for instance, made nothing like as big a success in his life-time as did the tailor William Craven, who possibly cut his coats; and John Milton, who sold his greatest work for a five-pound-note must have been thought a poor creature when contrasted with William Robinson, the Turkey merchant of York, who got himself a baronetcy and begot marquesses.

* * * * *

A "war book" in the full sense of the term, deserving of more than the normal amount of attention accorded to books of this class, is *From the Fire Step*, by Arthur Guy Empey, an American soldier who joined the British Army after the *Lusitania* outrage, and went through the normal experiences of an infantryman up to the battle of the Somme, when he was "outed" and finished up in a convalescent home in England. American humour is rampant in every page. "We had an orchestra of seven men and seven different instruments. This orchestra was excellent—while they were not playing." "The average English officer is a good sport, he will sit on a fire step and listen respectfully to Private Jones's theory of the way the war should be conducted." And from an appendix entitled "Tommy's dictionary"—"Spud"—"Tommy's name for the solitary potato which gets into the stew. It's a great mystery how that lonely little spud got into such bad company." These are very small samples from a large host, but the author has other views on the state of affairs in the firing line, as well as humorous ones.

"Returning to Tommy, I think his spirit is best shown in the questions he asks. It is never 'Who is going to win?' but 'How long will it take?'" "In Virginia, at school, I was fed on old McGuffey's primary reader, which gave me an opinion of an Englishman about equal to a '76 Minute Man's backed up by a Sinn Feiner's. But I found Tommy to be the best of mates and a gentleman through and through.

It is exactly the same as it was at Balaclava to say nothing of Gallipoli, Neuve Chapelle, and Loos."

These things are worth quoting, but they are not all the book, by any means. Ian Hay has done no better work in showing the British soldier in action and in "rest billets." In training, and as a casualty in hospital. With a keen sense of humour, this author has also a grasp of the magnitude of the war and its tragedy; he has written life as a soldier knows it, and he has written well.

* * * * *

Conscript Tich, by Jack Spurr, is just the sort of book that a boy will delight in. Tich was a little man who joined the Army because he couldn't help it, and came to see that military life brings out the best in a man, makes him appreciate his fellows at their true value, and forms excellent training for life in any station and capacity. There is just the right amount of trench and billet experience in the book with enough thrills to maintain the interest throughout, and there are also certain incidents which will raise a series of smiles—notably the story of how Tich, when escorted as a prisoner back to his unit for overstaying his leave, arrived back at headquarters without the escort. Without any pretensions to literary style, the author tells a good story, and one specially suited to juvenile tastes.

Of rather different quality is *Cheerio*, soldier yarns by J. F. Tilsley, on whom, to a certain extent, seems to have fallen the mantle of O. Henry—certainly some of these stories are clever enough for that author to own them, were he still able to own printed matter, and they have, in many cases, that curious and provoking "twist" at the end which was so characteristic of Henry's work. This is specially noteworthy in the story of Shy McGie, the boxer; in certain other stories figures Private James Thompson, whom many folk will be glad to meet. This is an excellent volume for company either in a railway train or beside the fire; its main point is an impish humour which will raise smiles in the most unlikely situations, and it is to be thoroughly commended by reason of the original treatment which the author has brought to bear on subjects that might have proved banal.

Copies of "The British Firing Line Portfolio" containing a series of Engravings in Colour by Captain Handley-Read and forming a wonderful record of the Battle-area, may be obtained, price 5 guineas each, from the Leicester Galleries, Leicester Square, W.

"The secret of success is to have Bolsheviks, Boloiks, and Caillauxiks in all countries except our own"

BY SPECIAL APPOINTMENT

TO H.M. THE KING.

The "LB" Uncrushable Trench Cap

Soft, yet retains its shape and smart appearance, being made on a foundation of special material which is springy—practically uncrushable and unaffected by wet. In best quality khaki whipcord, and fitted with leather headband.

Price **21/- net.**

Packing in Wood Box and Postage to the Front, 2/-

The ever increasing sales of this Lincoln Bennett speciality are proof of its super excellence.

The "LB" Adapter Lining for Steel Helmets is still the only lining soundly constructed on an efficient principle. Write for particulars. Anyone can fit it.—No lastenings required.—Distributes weight.—Equalises balance.—Provides ventilation.—Minimises concussion.—Obtainable in all sizes and shapes of heads.

THE PEOPLE'S FOOD

THE Christmas festival has been celebrated by the peoples of this kingdom in a more Christian spirit this year than ever before in the memory of living man. Through a rather obvious confusion of traditions, it is too often overlooked that excess of eating and drinking is simple paganism. In Bethlehem there was neither Ritz nor Carlton at which the Wise Men might banquet after the presentation at the Manger of their gifts of gold and frankincense and myrrh. Christianity had its birth in that very shortage of affluence which is the characteristic of the present times. Gluttony arose from the conjunction of this Birth Day with the Saturnalia of Imperial Rome, and the modern revival of the Saturnalia was due to an endeavour by an ardent publicist, Charles Dickens, to make the more fortunate in these islands realise, at least once in twelve months, the straitened conditions of the bulk of the people. This endeavour was both a success and a failure—a success in that it did attract the attention of the more thoughtful to the wretchedness that surrounded them, but a failure in so far that it provided the self-complacent with an easy and cheap method of conscience-money. So long as beef, blankets and coal were forthcoming at Christmas, they felt they had fully discharged their duty towards their neighbours, and it is a little wonder that as education spread these doles became repulsive to the self-respecting poor. "Be temperate in all things" is an admirable Christian dictum, but temperance never consisted in privation and semi-starvation for one and fifty weeks of the year balanced by gluttony and drunkenness during the remaining week, which was Christmas week.

It would be a very good thing if the quiet and homely manner in which Christmas was spent this winter became the custom hereafter. There is no reason why we should not maintain the kindly idea originated by Caligula, of providing presents for children or continue the habit of eliminating in our homes at this season for a few hours distinctions between master and man, between mistress and maid-servant, which though pagan in origin, is Christian in spirit, but we do hope there will be no return to that gross gorging that is so distinctly Teutonic. Also if the general well-being of the people is raised to a right stage, the horrid system of doles may well die. There will always be an interchange of presents between households and individuals in different ranks of life where good will is present on either side, but that is very different to providing warmth and food during a few hours in the year for folks who are honestly entitled to both all the year round.

Out of these abominable queues which Lord Rhondda is at last putting an end to, even good may come, in that they have made the more fortunate realise the difficulties that confront wage-earners who have to buy from hand to mouth, lacking the spare cash or larder-room to lay in stocks.

These queues have been the outward sign of the extraordinary difficulties surrounding distribution directly the ordinary channels of trade are interfered with, either naturally or artificially. These difficulties were anticipated in these columns weeks ago, because experience in other lands has proved that they always occur under such conditions. We ventured to suggest on the original formation of Food Committees that men of good will could not render better public services than by joining them, as the future of the nation's food supplies must turn largely on their labours. The Minister of Food has rightly and wisely deputed large powers to these Committees to deal with all shortage in local areas, powers which, if rightly exercised, should put an end not merely to queues, but to unevenness of distribution. Speaking broadly, we are convinced it is the wish and desire of all classes to share alike; there is as notable an absence of selfishness among the civil population as among the armies in the field. Exceptions no doubt exist, but we speak of the rule, and if the Food Committees will only exercise their new powers boldly and unselfishly, they will find they have behind them the support of everyone whose opinion and support are of any value.

A disagreeable feature of these queues, according to Lord Rhondda, whose opinions are confirmed by private experience, is that they have in some instances, and especially in the poorer districts, been occasioned by shops taking advantage of their possession of certain necessities, like tea or margarine, to advertise themselves. They have announced that such commodities would be on sale at certain hours, and thereby drawn buyers to themselves, who naturally prefer to spend their money on all kinds of goods in the shop where they can buy the special one they stand most in need of. In normal times this would be legitimate, to-day it is culpable if not criminal; indeed, it might well be made a criminal offence. But the Food Committees are now given the power to enter any shops where they have reason to believe such practices occur, commandeer their stocks, and distribute them among neighbouring retailers. It is probably the most drastic interference with individual right which "Dora" has hitherto permitted, but no general objection is likely to be raised to it.

We are strongly of the opinion that a Food Minister, to be fully effective, should be something of a Haroun-al-Raschid—he ought to mix freely with the people, unknown to them, and ascertain for himself actual facts. This must not be taken to imply that we consider Lord Rhondda should himself stand in queues and personally investigate every complaint against Food Committees, but he ought certainly to have an efficient organisation at his disposal which would enable him instantly to ascertain the true circumstances of each case, many of which, from the very nature of his task, will be novel and unprecedented. Had such an organisation been in existence, the queue trouble need never have reached the dimensions it did. A secret of the power of the daily Press lies in this very fact; it is able, through its organised staff to acquaint itself daily with the trend of public opinion and the actual conditions which cause it. A staff such as is at the disposal of a "news-editor," to use a term well-defined in Fleet Street, is badly needed at the Food Ministry, to enable the Food Minister to keep himself abreast of popular opinion. Inspectors or supervisors or any labelled official would be useless for the work. As things are, how is Lord Rhondda to satisfy himself that the Food Committees are all doing their duties. The majority undoubtedly will, but there will be a minority which will either behave foolishly or neglectfully, and the chances are that the Food Minister's first intimation of the seriousness of local conditions will be a riot or something equal to a riot. Lord Rhondda has little idea of the sympathy and support he has behind him if he will only act promptly. Mistakes can always be rectified; it is hesitation that irritates, more especially if it be combined with spoken advice, perhaps good in itself, but utterly worthless under local or class conditions.

The Historical Sites of War

By Hilaire Belloc

THERE is a most arresting historical point in connection with the great campaigns of this war, so academic that it seems cold to consider it, yet of permanent interest: It is the extent to which military effort has followed the roads of the past, has been checked by the old strongholds and has been directed towards the old key points; and the extent to which these apparently unchangeable geographical grooves of history have been modified and new ones created by modern men.

The similarity is certainly more striking than the modifications. The extent to which sites essential to the military history of the past have reappeared in the last four years has struck the imagination of the world.

If we tabulate only the principal ones of these recurrent sites and routes, the parallel is striking enough.

The two roads which menace Gaul from the east, are that by the Plains to the north of the Ardennes, and that by the gap to the south between those hills and forests and the Vosges—the gap of Lorraine. Both reappear at once at the origin of this campaign as the routes of invasion. The point of crossing the Sambre for the possession of the Belgian plains was also repeated. The Battle of Charleroi recalls the chief bridge whereby Napoleon's forces traversed that stream. More singular still perhaps, so vast a conflict as the Marne turned upon the general district (though not the actual few miles) which saw the determination of the other great threat to Europe—the invasion of Attila. The right of Foch's advancing army, after it had done the trick at La Fère Champenoise, was very near the huge ring which is still traditionally known as the Camp of Attila. And those same heights above the rolling ground of Champagne and of the Plains of Chalons saw the crisis in both struggles.

Familiar Names

The borderland between the Latin culture and the Germanic dialects, the levels of Flanders and their boundary hills of the Artois reappeared, and the same names grew familiar which had been familiar in fifty earlier wars: Cambrai, St. Quentin (where, when Spain was so powerful, the struggle between France and the power possessing the Netherlands was finally decided); St. Omer, Cassell, Dunkirk. The beginning of the retreat from Mons crossed the field of Malplaquet and the name of La Bassée appeared again in defensive warfare after 200 years; while the right of that movement was very near the point where the Republic had saved Maubeuge 120 years before in the Battle of Wattignies, the parent of all the Revolutionary victories. It lay also very near to the famous Camp, the quadrilateral of which you can still trace—the camp drawn by Cesar on the day when he defeated the Nervii, "when it was seen what the discipline of the Roman people could do."

In the east of Europe, there was, at the very outset of the war, a coincidence even more remarkable than any in the West; and one, perhaps, more difficult to account for. I mean the coincidence of Tannenberg. Tannenberg gives its name to the great victory in which the Poles destroyed the political power of the Teutonic Knights and reached their natural limits, the Baltic. The same place gives its name to the one really "clean" tactical success of this war: the envelopment and destruction of a whole Russian Army by Hindenburg in the late summer of 1914. It would require a much greater knowledge of the Masurian district than I possess to discover why, under circumstances so different and with approaches from points so varying, Tannenberg should in each case have been the place of decision. For the coincidence must have struck everyone and it must presumably have some geographical reason behind it.

On the southern end of the eastern line all the necessary sites reappear because one is there constrained by great rivers and high mountains. The stronghold of Lemberg covering the Carpathians approaches reappears; the Moravian Gate behind Cracow is again threatened from the east; the two great passes of invasion into Hungary are attempted but not passed, the Dukla and the Magyar. Further south still the great trench of the Vardar is the axis whereby the offensive from the north and the defensive from the south operate in the Balkans, as it was the axis in Roman times, the one necessary road from north to south.

The capital importance of the Narrows, which unite the Mediterranean with the Black Sea, reappears also in an unexpected degree of intensity. To get the alliance of Constantinople, to have a clear road to Constantinople through the Bulgarian Alliance, to make of Constantinople the bridge, as it were, permitting the extension of operations

into Asia—all these were but the reappearance of the Byzantine nodal point in the strategy of our enemy, and the Dardanelles expedition was but the reappearance of the same point in the strategy of the Allies. Salonika again becomes the necessary port of the Western Aegean; again, there appears the attack on Egypt from the north-east. Lastly, and astonishingly parallel to history thousands of years old, come the lines of advance upon Palestine from the south. All the elements are there. Gaza with its torrent bed to the south; the first stronghold, the point of contact, after the delay and handicap of the desert has been crossed. The first considerable natural water supply at Beersheba; the advance up the plains before the mountains on the right can be attacked; the sweeping round upon Jerusalem from the west. It remains to be seen whether the campaign will produce the further parallels of a crossing from Philistia to the Esdraelon plain, and of a northern advance which the mass of Lebanon deflects towards Damascus.

Notable Differences

When we look to the changes that have taken place in the main avenues and nodal points of warfare, we find that they have become by this time, after more than three years of a modern universal war, quite as striking as the similarities with the past.

Thus, after noting the extraordinarily close parallel between the advance upon Palestine and every other campaign from the south upon that country, we cannot but remark the complete contrast between the Mesopotamian campaign of the last two years and every other recorded effort in the same region.

The Mesopotamian campaigns have been in this war an advance up stream, through country that could not supply a great army. The offensive has been based upon the Persian Gulf; it is the defensive which has been based upon the Upper Tigris, the Upper Euphrates and the connections with Syria and with Asia Minor.

In the past there have never been more than three main schemes of warfare in this region, and these have been either of an advance down on to Mesopotamia from the uplands of the south-west, west, north-west or from the Persian mountains; or of an advance from Mesopotamia outwards in the opposite sense. Neither the Babylon of extreme antiquity nor the Bagdad of the Dark Ages was threatened from the Persian Gulf. What has made the difference here is the possession of Asiatic dominion by a European Power: which is a modern thing. That, coupled with steam, has made the present successful offensive in Mesopotamia possible.

The same quite modern conditions of Western dominion over the East have given us the cut across the Isthmus of Suez and have made Egypt strategically a totally different proposition from what it was before Napoleon the Third's reign and the last years preceding the great modern rise of Prussia in Europe. Egypt, including the Isthmus of Suez has now become one of the great nodal points of the world. As surely as we live a struggle of the near future, economic and political if not military (almost certainly military as well), will be the struggle for that nodal point.

Here I might usefully digress upon the shortsightedness of those who believe that a negotiated peace would leave this country—of all others!—where it was before the outbreak of the war. The hold of Great Britain upon that neck of land is something which a mere child looking at the globe can see to be dependent upon abnormal power. It depends on a distant, isolated effort which almost compels challenge. The Egyptian border is the door between the West and the East. Yet the keys of that door are in the hands of men living—that is having their being and tradition, their final affections and their homes—upon the edges of the Atlantic and right up in the north at that!

Nothing can save such a position from challenge on the part of an unbeaten rival save the dissolution either of the possessor or of the claimant or both.

I know that there are some so academic and living so much in an unreal world that they will believe or hope the future to be "international." They conceive that the peculiar soul and character of "England," "Prussia," "France" and the rest will rapidly dissolve under the present strain as religions have weakened (sometimes) after the great Religious Wars of the past. They are only ideas, and when the ideal weakens the value stands for nothing. It is not conceivable. These national differences are too rooted below and too permeating around for any such dissolution within a very long space of time. If it is not we that hold the Egyptian Isthmus

and nodal point; then it will be some other *national* culture. It will certainly not be an international Committee for long. Neither will it be a new Universal State. Of such a thing as that the present holds no promise at all.

To return to that important example of what historical geography means:

Another heavy modification produced by modern strategies in the old ruts of warfare is the difficulty of landing; it is one of the innumerable ramifications of the modern defensive by land. Ever since recorded history begins, whoever could sail in security with transports to a shore could land. His fate then depended upon whether he won or lost his battle upon the earth and upon his power of keeping up communications. The Britons landed in Gaul against Cæsar; Cæsar himself in Britain, and then the Empire following him; the Crusaders in Asia, long before them the Asiatics in Greece; the Normans in Southern Italy and in England; the Frisian and Danish Pirates (called Anglo-Saxon) in the fifth century, in this island; the Scandinavians here and in Normandy; The Black men of Morocco in Spain—and so on—it is an interminable list. Suddenly there appears for the first time in history a check—and we have seen that check in this war. It bears the names of the "Coast of Belgium" and in a modified form of "The Dardanelles."

Connected with this change, though of a somewhat different character, is the closing of the two great inland seas of Europe; which may be followed, perhaps many years hence (as we may note for future study) by the closing of the Mediterranean itself.

In the old days a strait of water had to be very narrow for it to be closed to a determined offensive; or if not very narrow then very ill-defined. But to-day a passage even some thousands of yards broad is as true an obstacle as was in the old days a long river entrance to a port. The Baltic has been nearly closed; the Black Sea absolutely closed to the action of the Western Allies. I think it is a point which has not been sufficiently insisted upon by the students of this war that any sheet of water with a fairly narrow entrance will, in future, or, at any rate, as long as the present conditions endure, be at the mercy of the power that holds the gate.

And here again we have an immediate and practical application, for surely one of the great tests of victory or defeat which the near future will show will be the ability or inability of European civilisation to make certain of the Black Sea and the Baltic against that hotch-potch of peoples run by Prussia, which calls itself "Middle Europe." If, at the conclusion of the war, the Sound and the Dardanelles and Bosphorus are in their hands then, without a doubt, they have defeated us.

Minor modifications will also be noted. The Pyrenees, for instance, one of the great obstacles to military movement playing a great part in so much of all history, have not only

not come into this war, but probably cannot of their nature come into it. This war's offensives and defensives do not lie upon axes which bring in the Pyrenees as a transversal.

There is a corresponding, though somewhat different, point to note in connection with the Alps. All through European history hitherto the Alps have been a passage, not an obstacle. It is an astonishing paradox, but it is true. The Roman Power poured over the Alps, so did the Gaul and the Carthaginian; so did the French in the Middle Ages; so did the German for three hundred futile years, between Otto the Great and the last and most civilised of their leaders, himself virtually an Italian.

Napoleon won his victory against Austria on the Plains, and had not even to challenge the mountains. Later he crossed those mountains and re-crossed them almost at will. To-day, by an accident which is political and not military, they have suddenly and *for the first time*, played an immense rôle as defensive obstacles although that rôle would seem to have been assigned to them by nature from the beginning. The whole story of the Italian campaign in this war has been the story of occupying, or attempting to occupy, the Alpine Passes, coupled with an inability to force them. The whole of the last chapter, the perilous business of Caporetto (the ultimate effects of which we cannot yet judge), was the story of the Alpine barrier turned with great difficulty, and indeed unexpectedly.

These are but notes suggested by the present aspect of the campaign and deal only with its largest lines. But we may note one last curious and not easily resolvable puzzle.

With the exception of the Dardanelles there has been no prolonged resistance upon a nodal point.

Hitherto in all wars whatsoever (with the exception of wars that have been a walk-over—wherever, that is, there has been a serious defensive), one or more nodal points where communications minor or major converged, have by resistance held up the campaign: Witness in modern times Metz, Paris, Plevna—and for centuries past any number of similar names. In this war no such name has appeared. It is an accident due partly to the fact that these vast siege lines have not admitted of particular isolated defences, partly due to the fact that—with the development of aircraft and the mobility of heavy guns, *permanent* defences had not in 1914 caught up the new powers of attack; partly due to the way in which the movements of the war swung. The nearest thing to a great nodal point (except the Dardanelles) appearing in this war, were the two cases of the river-railway crossings and road-crossings of Liege and Belgrade. Verdun, which some have quoted as an example, was nothing of the kind. It was but one sector on a front, and it was attacked, not because it was in any sense a fortress, still less a centre of communications, but because it was the jumping-off place for a counter-offensive; because it offered great facilities for concentration against it, and because it offered opportunities for surprise.

Mt. Asolone

The Austro-German thrust between the Brenta and the Piave, designed to turn the Italian positions between the mountains and sea, continues to be the principal action in the opening of this fourth Christmas week of the war.

Though it was only a matter of conjecture that the chief enemy effort would continue to be made in Italy, the conjecture was reasonable; and the logical foundation for it was given at some length in these columns last week. The enemy could, if he reached the Plains and threatened the Italian communications, achieve such a result here as he could not hope for at the same price anywhere else in the West. The very fact that he was openly advertising his intention to transfer his strength elsewhere was a reason for believing that his main effort would continue to be against the convenient flank which conditions of ground and the final decision *not* to retire to the Adige had created for him in Italy.

One of the considerations which must here be specially insisted upon is the effort represented by a great accumulation of shell in a mountain country. When you are using, as the enemy is here using, something over 4,000 guns, first and last—of which as many as 2,500 have been found concentrated upon some 20,000 yards of line—and when this enormous mass of artillery is delivering one intensive bombardment after another, it means an accumulation of heavy material which pins the offensive down for a long time to the sector it has chosen. It is like locking up money in an investment. You are tied to the plan which you have unmasked and you must carry it through. To form such an enormous concentration of heavy pieces and their munitionment in exceedingly difficult country and not to try and carry through the object for which so vast an investment of energy was made, would be strategically nonsense; for it

would take almost as long to dissociate the elements of such a concentration as it did to associate them.

We may take it, then, that the enemy is putting forward every element of strength which he can locally bring to bear, with the object of reaching the Italian Plains. And the next two things for us to note are first that he has gradually approached his object, gaining point after point, and never suffering a serious or permanent check; secondly, that the last step towards his objective is now, in one critical point, a very short one. That point is the crest of Mt. Asolone.

As has been pointed out previously in this place, the one great avenue of approach between the Adige and the Piave for any considerable force with its wheeled vehicles and pieces from the mountains to the Plain, is the valley of the Brenta.

That valley has two excellent roads running down it on either side of the stream, a railway which we may be almost certain now connects—in spite of destruction under retreat—with the main enemy system. Once the mouth of this Brenta valley is secured for debouching at Bassano, this capital avenue could be used to pour men and supplies upon one point in numbers far greater than they have been concentrated hitherto since the enemy pierced the Italian line at Caporetto on the fatal 24th of last October. The mere threat of such a thing, when that threat became acute, would be enough to compel the retirement of everything to the east of Bassano—that is, of the whole Piave line.

Now the elements of the ground in this lower part of the Brenta Valley are these. You have a wide trench, too wide to be called a ravine or a gorge, the flanking hills of which are some 4,000 feet above the sea. On the eastern side this boundary range is crossed by certain passes which lie very high up on the ridge, such as the pass called the Pass of

Caprile, and this eastern ridge culminates in the crest of Mount Asolone. From that crest falling slopes spread out southwards and westwards towards the Plain, and rise into a number of lesser peaks, plateaux, and ridges, all dominated by the summit of Asolone. The last fall of this mountain system on to the plain is everywhere fairly steep, forming, as I have said, a sort of wall, but it is more gentle towards the mouth of the Brenta Valley than it is further east. Due east of Asolone (which is nearly 5,000 feet high) is the still higher and larger massive system of Mount Grappa. To the south-east of this again, right on the edge of the Plain wall, and a good deal lower than Grappa, is Mount Tomba, and a few thousand feet east of the latter one strikes the River Piave, which the line thence follows to the sea.

On the western side of the Brenta Valley there are, as I have explained in previous articles, two ravines leading down from the plateau above; the uppermost is the Val Gadena, the lowermost is the rough and difficult, but practicable, Val Frenzela. I believe that heavy pieces can come down the Gadena. Down the Frenzela only infantry and mountain guns, I imagine, could move. But I am talking of the conditions before the war, and I do not know what changes may have been made during the campaign or whether a road to bear heavy guns now exists in this ravine.

At any rate, whenever or if the enemy is master of the Frenzela Valley, he can bring forces down it which would leave him absolutely secure to move his heavier material down the Gadena behind; and, in general, his possession of the Frenzela (which would be marked by his occupation of Valstagna, the village at its mouth) would give him a secure hold of the whole Brenta Valley, short of its actual issue on to the plains at Bassano.

The enemy's action for the mastery of the Brenta Valley and of possession of an ultimate power to debouch from it on to the plains, has been that which must always be followed in a slow process of reducing a defensive line of this kind. It is the process which was followed for so many months at Verdun. It consists in creating dangerous salients or "bulges" in the defender's organisation by thrusting in heavy blows at selected points on either side.

In mountain country these blows must always be delivered against heights which, when they are lost to the defensive, weaken it all round, not only from loss of ground, but from loss of observation and dominating positions.

This is what the enemy has been doing throughout the month of December. He has attacked and carried off three mountain crests, first the extreme right or left, then its fellow on the left or right. He has thus half isolated the central one, reduced it in turn, and so gone pounding forward by flattening out one salient after the other, until he is now near the end of his task.

If you take his original line and mark his method of advance you see this clearly. He originally finds a defensive relying upon certain peaks. He masters a number of separate peaks, leaving in his second line salients in their intervals. The salients are reduced and he is left with his third line nearly flat again. He makes new drives producing new salients. The most important now left before the plain is now that of Mt. Grappa. He strikes again at Asolone, rendering the Grappa salient extremely precarious.

So by methodical stages and in a manner which is perfectly clear when one follows the map, he elbows his way down towards the plains.

On the east he already overlooks them from Mt. Tomba. With Asolone in his possession, last Tuesday, he overlooks them from the western part of this sector, and put Mount Grappa in between the two points into great peril.

But Asolone has a value of its own quite apart from its effect in outflanking Mount Grappa. You have from this summit a view right down on to Valstagna. His permanent possession of Asolone would probably involve the occupation by the enemy of Valstagna and the consequent opening of all approaches down from the east on to the Brenta Valley. It is too much to say that the permanent possession of Mt. Asolone in itself would give the enemy the Brenta Valley right down to its mouth, but, at any rate, it is the chief point of ground in all that district, and whoever holds it has the balance of the chances on his side (on the offensive) for obtaining or retaining (on the defensive) the mouth of the Brenta Valley.

It was the importance of Asolone which led to the tremendous fighting of last week. The summit fell into the enemy's hands in the course of Tuesday last, December 18th. This great success was only obscurely suggested in the Allied account, where we were told of the Austro-Germans that: "Only on his left did the enemy succeed in gaining and maintaining advantage in the Monte Asolone zone." But the enemy bulletins naturally gave the affair in its true light—since it was an enemy success. The Germans told us that: "After strong artillery preparation Austro-Hungarian troops stormed Mt. Asolone. More than two thousand men

were taken prisoners"; while the Austrian bulletin conveyed the same truth in very nearly the same terms.

On the next day Wednesday, a strong Italian counter-attack began to develop. On this the Italian bulletin of Thursday morning was silent, presumably because the operations were still developing and the plan had to be kept secret. It was now the enemy's turn to be more guarded and careful in his account. He merely told us that "repeated Italian attacks against Mount Asolone failed"—the usual phrase common to almost every belligerent when heavy pressure is developing against him.

By Thursday, however, there was already a hint in the communiqué issued by General Diaz that the Italian effort to recapture Mt. Asolone was achieving some measure of success, and on Friday the Italian Prime Minister was able to announce in the Chamber that the summit had been retaken, and was once more in Italian hands.

At this point the news to hand at the moment of writing (Sunday evening) ceases. Asolone, that critical height, was lost to the Allies early in the week, regained by them, and (on Saturday last) was still held. The battle continues.

H. BELLOC

Germany at Bay

THE literary stylist may find something to cavil at in Major Haldane MacFall's *Germany at Bay*, for the author has not troubled about his phrasing; he is far too fond of telling his reader to "make no mistake about that"; he is so deadly in earnest that he has hardly time to find the right phrases to express his meaning, and yet his work grips the reader throughout, for it is very evident that he knows what he is talking about, and that he has a definite message to convey. That message, in one word, is "Serbia." The author says, and adduces plenty of reasons for saying:

If Germany be defeated in the west, if Belgium be given back to the Belgians, if Northern France, with Alsace and Lorraine be restored to the French, if the Kaiser be deposed; but if the Pan-German war map remain German, no matter to what humiliations the German bows, the German has won the war.

That Pan-German war map, which, as the author points out, was circulated throughout Germany in February 1916, consists in a German iron road from Berlin to Constantinople, cutting Europe in half, and separating Slavonic Europe from Western Europe, giving Germany *Mittel-Europa* for which her rulers have thirsted since 1870. The independence of Serbia spoiled this map. Major MacFall outlines the fall of Bismarck, and the coming of the dream to Wilhelm the Mad; he tells how even Bismarck, the great dreamer, drew back at a plan that was to smash not only France and Russia, but, with a second blow, Britain and America as well, and how Wilhelm II. was content to sacrifice commercial prosperity, everything that his great empire offered him, to this dream of conquering all Europe and then all America by means of ruthless war. Further, he insists on the doctrine which all clear-sighted students of the war have enunciated: in addition to victory in the West, there must be an independent Poland, a restored Serbia, and an utter smashing of the German war map plan; there is no halfway-house between victory and defeat; either the Allied forces must smash this German dream, or Germany has won.

Here is set forth with absolute clearness that we need not trouble about the war aims of anyone but the enemy, which are the establishment of the Pan-German map for the making of another and even greater war, and the utter destruction of civilisation as the Western nations know it, in order that there may be set up the gospel of brute force. The book is tonic, and Field-Marshal French's recommendation that men should read it is one that every thinking man will endorse. There is one paragraph, especially, which pacifists might take to heart:

We find ruthless valour boiled down to this: that the superior breed, the German, is entitled to break all laws that bind inferior breeds, his enemies, and to inflict on them any cowardly or vile treachery or crime; but that if these acts be committed upon *him*, then his enemies are guilty of an enormity which in him is not an enormity but a virtue of Ruthless Valour! This is called "Squealing."

Germany, says Major MacFall, is entering upon the most deadly peril to mankind—her peace strategy, and the defeat of that strategy rests on the democracies of the world. This book, showing how deadly are the German peace-plots, is a call to action for the men behind the armies, and thus is a work deserving of the widest publicity.

Germany at Bay. By Major Haldane MacFall, with an introduction by Field-Marshal Viscount French, and a portrait by Joseph Simon. (Cassell and Co. 6s. net.)

Leaves from a German Note Book

Politeness to Order

THE Prussian Minister of War recently issued a special decree to all officials under his jurisdiction bidding them be polite in their dealings with the public. He addressed them in these terms:

Every individual has his load to bear in war time, and no one should unnecessarily increase the weight of this burden. This is done, however, when officials in their intercourse with the public do not give the required information quickly and politely, but make it an occasion for the promotion of dissensions and misunderstandings. He who acts thus injures the Fatherland and shows himself incapable of his task. Life is hard enough in these days, and if after receiving this warning anyone continues by his behaviour to make it harder still for his fellow men, he will not be suffered to retain his position.

The Minister of Posts and Telegraphs has followed suit, impressing on postal officials so to behave to the public as not to give them just ground for complaint. All complaints, he warns them, will be thoroughly enquired into, and action taken where necessary. A similar notice has been issued to the officials in the Berlin Purchasing Permit Office.

Why this insistence on politeness? The Berlin correspondent of the *Vienna Zeit*, who ought to know, provides the explanation. Germans in the large towns, and in Berlin more especially, are suffering from acute irritability. People are excessively rude to each other in the streets, on tramcars, in the underground; they are inconsiderate to officials, and at the least occasion pour out abuse in abundance, with the result that the officials retaliate. Quarrels in public offices have become every-day events; the *Zeit* correspondent speaks of an "epidemic" of rudeness. It is a sad look-out for the time after the war, he writes. The worst offenders are the women. This gentleman observes that not the officials only, but the entire population in Germany should be dragooned into politeness.

It is reported from Berlin that never before have the shops had to cope with so much shop-lifting as this Christmas. Nor are the culprits always poor folk. The reason alleged for this particular misdemeanour is nerves. It is also stated, however, that as necessary articles of clothing cannot be obtained without a permit, people help themselves to them where they can.

The large number of suicides also bears witness to the nerve strain. On November 21st, to take a single illustration, no less than 11 cases of gas poisoning were reported in Berlin. Burglaries have become exceedingly common; not a day passes but numerous instances are reported to the police. An official document declares that the breaking open of safes is the most favourite sport of the burglars. But they have a partiality too for shop windows, larders and stables. Pick-pockets abound everywhere. This same official statement continues: "Railway trucks are broken open and pillaged; trunks are spirited away from luggage vans; the people affected are hit very hard by these losses, for it is difficult, if not impossible, to replace what has been stolen. The culprits are not only professional thieves, but it must unfortunately be admitted that soldiers also are among them." The burden of this human document is that the public should not always leave everything to the police, but should defend themselves against thefts by taking greater precautions and by seizing delinquents when they can.

Nerves and Patriotism

Nerves are also responsible for the foundation of yet another patriotic society. In order to complement the Patriotic Party, which has limited its activities to foreign affairs, an "Association of the Supporters of the Crown" has been formed to rescue Germany from becoming a democracy. It looks as though the new society is an offspring of the Patriotic Party, but the latter has disowned it. Yet the voice is the voice of the Patriotic Party.

"The German Empire is in the gravest peril. The majority of the Reichstag demand the parliamentarisation of the German Government." The rights of the Kaiser are attacked; those rights must be rescued before it is too late. "We must arm, arm quickly, arm at once, or we shall be defeated by tendencies which will and must lead to the destruction of the German Empire." A few insignificant nobodies have issued this appeal to the German nation, and it would be difficult to explain the document except by reference to the prevailing hysteria in Germany. The Patriotic Party managed to rope in Tirpitz as its leader. The "Supporters of the Crown" have no one to compare with that whiskered seaman.

Patriotic hysteria is also apparent in the thick type advertise-

ments in the newspapers, right in the middle of the reading matter, to this effect:

"Germans! Beware of anyone who asks about military or business matters! The spy danger is greater than ever."

That this is no mere window-dressing is evidenced by the case of a youth who happens to have almond-shaped eyes, who was arrested in Liepzig as a Japanese spy! The poor apprentice, who is only 14, had come into that town from Delitzsch, and it would have fared ill with him but for the lucky accident that a neighbour recognised him and established his identity.

Russian Peace Negotiations

The Patriotic Party in its anxiety lest Germany should not obtain the best of the bargain with Russia, has passed a long-winded resolution, the gist of which may be expressed thus. Germany must decline to negotiate a general peace. She must limit herself to a separate peace with Russia. The German plenipotentiaries are to be guided by German interests, and by them only. They are to obtain for Germany in the East what she needs—the military security of her frontiers, territory for planting German settlers, and the establishment of German supremacy in the Baltic. At the same time, Germany must not lay down her arms until she has smitten England to the ground.

Such are the desires of the Extremists. But are the moderate men any saner? The *Frankfurter Zeitung*, which may be taken to express the views of liberal and financial circles, wrote as follows in a leader on December 8th:

The Central Powers have succeeded in all they have undertaken, and are now quite ready to conclude peace, but although Russia has withdrawn from the conflict and Italy has lost rivers of blood, England and France, whose spirits are raised by the promises of the United States, remain standing erect and stubborn. They even demand Alsace-Lorraine, and, because they want to tear a piece out of Germany's body, the German armies must continue the mortal combat to prevent them accomplishing this object.

Views of Iron Magnates

The *Frankfurter Zeitung* only speaks of the demand of the Allies. It says never a word about the demands of the German captains of industry. The great iron-masters of Germany met in Berlin on the same day as this leader appeared, and agreed that the coming Peace must be an economic peace, must secure the German home markets against foreign competition, must remove any possibility of German manufactures being dislocated in the future and must give Germany an extension of territory, in order that she may have more land for growing foodstuffs.

The German Iron Industry must have the iron ore district of Briey and Longwy. Why? Because the other Great Powers are better off than Germany in the matter of iron ore. This is a typical German argument. There is no consideration for the rights of others, no word even about rights, only demands are enunciated. Germany must have what she covets, and there is an end of it. And yet the Germans innocently ask what the world means by "Prussian Militarism." When President Wilson and other Allied statesmen have declared that the German people are in bondage to their rulers and have no voice in their affairs, the German press has replied that the German political institutions are the freest in the world. But no one was taken in by this sham pretence, and to-day the German Press of the Left, forgetting what it told the world only a few weeks ago, is bursting with rage because the Franchise Reforms in Prussia are meeting with determined opposition.

The history of these reforms is an instructive story. Prussia at present has what is universally regarded as the most backward franchise in all the world. It is so arranged as to give preponderating political power to the wealthy classes. From time to time a reform of the system was promised, but nothing was done, owing to the strong opposition of the Prussian Junkers, perhaps the most reactionary class in Europe. During the war the cry arose that if the Prussian people was shedding its blood in defence of the Fatherland, it ought to be given a franchise broad-based on democracy.

"When the devil was ill, the devil a leech would call; when the devil was well, the devil he damned them all." If the Kaiser scorned the demand for franchise reform before the war, that was because he was well. Now he is ill, and must perforce bow to the storm. So the Kaiser pledged his word that the reforms would be introduced. After a time the people demanded that the pledge should be kept. Another promise

followed. At length the matter could not be put off any longer, and when the present Chancellor was appointed, one of the conditions to which he submitted was to introduce a democratic franchise in Prussia. He has delivered the goods and the Bill is being discussed in the Diet. But the Conservatives have declared war to the death against the measure. They will save the Crown from itself. If the Bill became law, it would mean the end of "Prussian Tradition" and the break-up of the German Empire.

In view of these opinions, it is of interest to know what the Socialists think of it all. Their sentiments were voiced in a speech by Herr Ströbel; one or two extracts will sufficiently indicate the tenor of his remarks and give a glimpse of the popular feeling in Germany!

M Caillaux—II

By J. Coudurier de Chassigne

Last week the writer of this brief sketch of M. Caillaux' political career described personal interviews he had with him at the time of the Agadir crisis in 1911. He then reviewed M. Caillaux' public career, taking it up to 1902 when, being Minister of Finance, he retired on M. Waldeck Rousseau resigning the Premiership on account of ill-health.

ALTHOUGH M. Caillaux retired in 1902 and was out of office until October, 1906 he was not inactive in the Chamber of Deputies. He had by that time become one of the stalwarts of the Radical-Socialist party, and a master in the art of intrigue against the different Ministries and the leading politicians who still barred his way. It was in 1906, as Minister of Finance in the Clémenceau Cabinet, that he appears to have finally renounced the dearest traditions of the Moderate Republicans, when he successfully piloted through the Chamber of Deputies the Income Tax Bill, which had become one of the cries of the Radical-Socialist party. But as it appeared from correspondence subsequently published by M. Calmette in the *Figaro*, M. Caillaux was only playing for the gallery when defending that financial measure before both Houses. Through his clever manoeuvres, he managed, however, to get that Bill rejected by the Senate. On that occasion, as on many others, his double dealing had only one object, to help him to get on at any price.

But I have no desire to recount all the disclosures that were made by the editor of *Le Figaro*, my faithful friend and chief, M. Gaston Calmette, at the end of 1913, and during the first months of 1914. Suffice it to say that M. Calmette was on the eye of publishing documentary evidence relating to the notorious swindler Rochette, and extremely compromising to M. Caillaux, when he was shot by Mme. Caillaux, who, did not shrink from a criminal action to save, as she imagined, her husband's reputation and future.

By the strange irony of fate, however, she did her husband more harm than any of his enemies could ever have done. From that day M. Caillaux slipped as it were in the blood of his victim, and fell into the mire, possibly never to rise again.

It was then, with the object of saving his wife from the consequences of her crime, that he entered into a compact with the ex-convict Vigo-Almeryda. He gave over £3,000 to the *Bonnet Rouge*, Vigo's weekly organ, which, on the strength of this support, became a daily paper. I need not enlarge here on the campaign M. Caillaux and his worthy friends started in the press and in political circles to influence the Courts of Justice. I confess that for the first time in my life I was ashamed of being a Frenchman when I heard that a judge and a jury had been found in Paris to connive at the miscarriage of justice which resulted in the acquittal of the woman who had, in cold blood, murdered Gaston Calmette. Four days after that stain fell upon its fair name, the German storm burst upon my country, and in 24 hours the real France, the France of the people, proved to the world that it was worthy of its ancestors and of its glorious and patriotic tradition.

With regard to M. Caillaux's political opinions, he had, of course, the right, as long as he remained in private life, to differ from the majority of his compatriots, and to pretend that in his estimation France had more to gain by becoming the humble servant of Germany than by grasping the loyal hand extended to her by England. M. Caillaux, alas! was not alone of this opinion; he had with him the motley crowd of naturalised Germans, like his friend Ullman, and the international financiers like Rochette, Bolo, with their jackals Vigo, Landau, Paix-Séailles, Leymarie and Malvy.

The moment M. Caillaux became the head of the French Government, his duty was to carry on loyally the policy of Entente Cordiale with England, which for eight years had been the pivot of our diplomacy. What did he do instead?

Peace would come quickly if only Russia and Germany were so shaped that they might take their place among civilized nations.

What brought this terrible calamity (the war) upon the country? The thoughtlessness of the Government and the parties which did not shrink from the incredible ultimatum to Serbia.

I am not inciting to Revolution; Revolution will come of its own accord when the time for it is ripe. But you will make it ripe if you continue the war much longer. Who among you would have believed that we should carry on the submarine war for a whole year without any tangible success?

The German people does not want to be a pariah; it desires to make its peace with the world as a free people, determining its own destiny.

The following story, the accuracy of which I can guarantee, throws a sinister light on his conduct towards England during the Agadir crisis:

When France and England were negotiating in perfect agreement to limit the insolent pretensions of the German Government, Herr von Kühlmann paid a visit to a certain high person in the British Foreign Office, and said to him: "We are heading towards disaster. Will you not help me in keeping the peace of Europe?"

"With all my heart," replied the English diplomat.

"Well, then," replied Kühlmann, "why are you more French than the French themselves?"

"Not to my knowledge," answered the Englishman.

"But you know that the French Government is prepared to make much more important concessions than you will consent to officially?"

"Not in the least," insisted the British diplomat, rather surprised.

"Well, then, I cannot understand, it," said von Kühlmann, "for you have never deceived me. However, if England continues to adhere to its intractable attitude, it will be impossible for me to believe that you are not trying to influence the French Government secretly in your own interests."

A year later Kühlmann said to the same diplomatist: "I owe you an apology. I ought never to have doubted your word, and I know that you were not aware of the secret negotiations of M. Caillaux."

Poor Gaston Calmette realised long before 1914 that Caillaux and his gang of denationalised scoundrels were endangering the very life of France. He did his utmost to warn the country in time, and died in the attempt.

But what already constituted before August 1914 more than a possibility of grave danger, became on the day that war started an actual menace to the safety of the State. M. Caillaux, as a mere citizen, had the right to be an Anglophobe up to August 1914; since then, his attitude towards England is a real act of treason. And to-day the case of Caillaux and his accomplices has ceased to have anything to do with politics in the true sense of the word, though at this moment he and his partisans are trying their utmost to confuse the issues before the bar of public opinion. They hope to drown the definite accusation of treason in a general debate on the theories of world-politics dear to M. Caillaux. The position is, however, clear. France is now called upon to judge a man accused of acts of treason which fall under different articles of both the civil and the military penal codes. In such cases a court martial is the form of justice now applicable to all French citizens. No exception can be made because M. Caillaux once enjoyed the honour of being Premier and still belongs to a representative assembly.

Moreover, the prosecution of M. Caillaux by the military Governor of Paris has the unanimous approbation of M. Clémenceau's Cabinet. Nor has the accused any more right to select his judges than his Parliamentary colleagues have to interfere with the normal course of justice. Unlike M. Malvy, M. Caillaux has not appealed in time to the Chamber of Deputies to bring him before the High Court. All that assembly could legally do is either to suspend his Parliamentary immunity, or to refuse to do so. They have suspended his immunity.

But it is hardly possible to imagine the outcome of such a situation of unparalleled gravity for the State. Any attempt on the part of the Radical-Socialists to rescue their leader from the legal consequences of his actions would inevitably recoil on themselves. Nor does that party, which has been identified with so much that is deplorable in the political life of France, occupy the position it did in the council of the nation. To-day it is a moribund survival of an age which is dead, and has nothing in common with the new France, the France of Verdun, the France of to-morrow.

Can the Battlefields of France be Farmed Again?

By an American Farmer

A GOOD deal has been written about the rebuilding of the destroyed towns and villages in the battle-ravaged area of Northern France, and it is also encouraging to record that a good deal of tangible progress has been made toward getting started with this part of the restoration work as soon as there is opportunity to do so. Money in abundance—much of it from America—has been pledged, so that a beginning on a grand scale is possible just as soon as labour is available—probably not long after the declaration of a general peace.

Much has also been written about the restoration of the farming land of the battle areas, but—in contrast to the progress that has been made in getting ready to rebuild the towns and villages—little in a practical way has yet been done toward taking up the task itself. It may be just as well to point out at the beginning, that any programme which does not make the restoration of the farming land a *condition precedent* to the rebuilding of the villages will be a sadly misdirected if not a futile one. This will be readily understood from the fact that practically the only *raison d'être* of 99 per cent. of these little rural communities was as trading centres for the farms and farmers, so that unless the farms themselves are restored to cultivation, there will be nothing to warrant the existence of the villages, whose peoples must inevitably drift elsewhere to find a livelihood.

This being so, it is a great pity that practically all that has been written on the question of restoring them to their former productivity has been of a pessimistic nature. There is an old saying to the effect that "war passes the theorist by and sinks its plummets deep in human experience." Most of the pessimistic writing to which I have referred is by theorists, who do not realise that "war has passed them by," and that their "theorisings"—no less mischievous than discouraging—have already been confuted by cold facts.

Poisoned Soil

Ever since the battle of the Somme was well under way—with its obliterative artillery preparations and barrages—I have been reading in French, English and American newspapers and reviews articles or letters—several from not uneminent scientists and engineers—all purporting to demonstrate beyond the peradventure of a doubt that the once fertile agricultural region of Northern France—that part of it, of course, which had been most heavily fought over and bombarded—could not but remain an absolute desert (so far as agricultural production was concerned) for anywhere from a minimum of two or three decades to half a century and more. Two or three distinguished chemists—distinguished at least to the extent that each had a long line of letters after his name—held that the soil was so thoroughly "poisoned" from the fumes of asphyxiating gases and high explosives that it would be many years before it could become sufficiently purified to support any kind of plant life. A Professor of Agricultural Science was equally certain that the bringing to the surface of so much of the lower strata of soil—which contains little or no *humus* (decaying vegetable matter)—would render the land too sterile to be worth cultivating for an indefinite but very long time.

Practically all of the more "learned" of these theorists appeared to base their beliefs that the French battlefields were doomed to remain deserts on the "poisoned soil" or "debilitated soil" ideas. None of them—so far as I remember—claimed to have made any study of the question in the battle area itself. If they had—especially during the last summer—they would have seen a few things calculated radically to alter their opinions. What these things are I will outline presently.

Besides these laboratory experts, there were—indeed, there still are—many level-headed practical men—including not a few soldiers who have fought in France—who have written or said that the more intensively bombarded areas of the battle zone could never be cultivated again for the simple reason that they were so frightfully torn up from shell and mine explosions that it would be impracticable to move any agricultural implements over them. The land is not worth the labour of levelling by hand, they say, and yet—because there is no room for machinery to get about that appears to be the only way the thing can be done. They also point out that the hundreds of miles of barbed-wire inextricably mixed with the earth will make it extremely difficult to plough or harrow, while the countless thousands of buried unexploded shells—which might conceivably go off when turned

up—introduce an element of actual danger.

The views of these latter are entitled to the respect due to any honest opinion based on first-hand observations. Even so, however, I am convinced that their pessimism regarding the problem in hand is only less warranted than that of the theorists pure and simple. That is to say: the physical difficulties—great as they are—in the way of cultivating even the most heavily bombarded regions of the war zone, are not going to prove an insurmountable obstacle to their restoration to productivity; the averred "poisoning of the soil!" is the merest "bogey," and is not going to prove an obstacle at all.

Ill Advised Pessimism

How mischievous these not ill-intentioned but certainly ill-advised pessimistic utterances have been I had opportunity to judge recently, when I talked with a distinguished Frenchman who is directing the movement for the restoration of villages and lands of the battlefields after the war.

"Money has been pledged," he said, "for the rebuilding of the destroyed towns almost faster than I can allocate it; but whenever I endeavour to present the case for funds to be used in putting land again under cultivation, I am met at once with scepticism and luke-warmness. This or that scientist, I am told, or this or that General or Cabinet Minister, has said it can never be done; so why should they be asked to subscribe money for a scheme that is foredoomed to failure when the needs for actual housing are so great? That sums up the popular attitude in the matter, and so far my efforts to show that there will be no use in restoring the villages unless the farms are restored at the same time, have not met with much success. Moreover, until a presentation of the true facts of the case undoes the harm that has been done by all this loose talking and writing, we are going to be greatly handicapped in making adequate provisions to get the work under way. Anything you can do to show what utter nonsense is this idea of abandoning so many square miles of our fairest farming lands and allowing them to revert to primeval desert without an effort to reclaim them, will be a great service to my country and my countrymen."

To those scientists who hold that the land of the battle areas has been "poisoned" beyond remedy by gas and shell fumes, I might point out that, while these fumes occasionally bleach and cause fresh grass and foliage to wilt and die down, the effect is only temporary—usually only for a few days, rarely for more than a week or two. If the roots are injured it is from being torn up by explosions, not from the fumes. In any event, the soil itself is not deleteriously affected. As to the effect of the constant churning of the earth by bursting shells, I might point out that sub-soil cultivation by the use of dynamite has been practised with invariable success in America for several years. I myself have practically rehabilitated a run-down and almost worthless apricot orchard on my California ranch by cracking up systematically the underlying "hard-pan" with dynamite and giving the starved roots a chance to penetrate to the moisture-laden levels below. Even a barley field increased its yield fifty per cent. after a thorough tearing up by exploding small charges of dynamite at twenty foot intervals. In all the world I know of no land that would be likely to benefit more by a cracking up of its sub-soil than that of Northern France, underlaid (as it is) by strata of decomposing chalk. Well, just such a cultivation it has now received, and a hundred times more thorough a one than any farmer who had to buy the explosive himself would ever give it.

To the Professor of Agricultural Science who maintained that the land of the battle areas would be "debilitated" by the admixture of a great quantity of non-humus-bearing soil from below, I might point out that for every pound of the latter thrown up by a shell from the apex of its crater, anywhere from fifty to a hundred pounds of earth rich in decaying vegetable matter is scattered from the frustum of the cone which is torn out nearer the surface. A one or two, or even a five per cent. admixture of non-humus-bearing sub-soil will do the surface soil more good than harm, as any farmer who has practised extra deep ploughing will testify. I might, I say, point out all of these things to the scientists and professors, in an endeavour to controvert their theories by what I know to be facts. Fortunately, a better way was open to me. Through the courtesy of the French and the British War Offices, I made a visit in person to the principal battle areas of the Western Front, there to study at first hand—in the light of my experience as a farmer—the problem of the

restoration of the shell-ravaged fields. The regions visited included the four most bitterly fought over in the West—Flanders, the Somme, the Champagne and Verdun—and no sooner had I traversed a mile of the first of them than I had all the evidence I needed to convince me of the "utter nonsense" (to use the expression of the French official I have quoted) of the contentions of the learned theorists who have so lightly condemned these blood-hallowed fields to half a century or so of wilderness.

There is one of the quatrains of the Rubaiyat which begins:

I sometimes think that never blows so red
The Rose as where some buried Cæsar bled. : : :

Old Omar Khayam never saw a battlefield after a bombardment with modern high explosives, but the fact remains that these lines might just as well be written of the Somme or Champagne as of the fields where the hosts of Xerxes and Cyrus fought and bled. Never under the hand of the husbandmen have the fields of Northern France brought forth such a wealth of verdure as this last summer, and the fact that the most of this growth consisted of wild flowers and weeds was merely because nothing else had been planted in their stead. Trenches, used and disused, were clothed to their parapets in a dense mass of rank vegetation, and the only shell-holes which were not half-submerged in greenery were those which had been formed within the month.

The only evidence of "poisoned" ground I saw was where a saffron pool—a foot or two across—had formed under a cracked but unexploded shell, or where the film of petroleum had been deposited on the grass of some undrained hollow. Likewise, "debilitated" ground only appeared where some sharp ridge or hill had been scoured down to the very bed-rock by intensive bombardment, and even then, the barren area was usually measurable in yards. That endlessly fought for and bombarded Butte de Warlencourt was the most striking example I came across of this sort of thing. That strange little wart on the Somme plain must have had all twenty-five feet of its round top blown off by the thousands and thousands of British and German shells which were rained upon it in the months before the retirement to the Hindenburg line put an end to its value as the one observation post on the whole sector. Yet on only the last ten or fifteen feet of solid chalk—the bald crown of the Butte de Warlencourt's devoted head—has the vegetation failed to find a footing. The lower two or three hundred feet of slope was knee-deep in fragrant verdure, and one had to step with care to avoid tripping in the fragments of barbed wire it concealed.

Wealth of Wild Flowers

And not only was it the wild flowers and weeds and other hardy things that were springing fresh and green, but even such "domestics" as had the chance were making the bravest of showings. In one place I saw where the seeds of the petunias, snap-dragons and nasturtiums of a little old-fashioned garden, which had been turned over a dozen times by bursting shells, had sprouted, grown, and were flowering as I have rarely seen any of their kind flower before, even under the hand of a gardener. A score of times I walked in head-high patches of "volunteer" oats, wheat and barley that would undoubtedly have dwarfed the carefully-manured and tended crops which grew there three years previously, and once—near the site of the pig-sty of a ruined chateau, growing from the bottom of a "Jack Johnson" hole—I saw a towering clump of Indian corn which might well have given pause to a tank.

A day on the Somme last summer would have been quite enough to convince the most sceptical that, if this region really was doomed to revert to desert, it was not going to be because the ground was "poisoned" or "debilitated." The physical problem of cultivation is, however, quite another matter. I must confess that when I first saw the condition in which the ground about Thiepval, Fricourt, Contalmaison, Pozières, and a dozen other bitterly fought-for points in the Somme area had been left, I was so appalled by the sight that, for the moment, I was inclined to share the view of the many who were saying that no practicable way ever would be found for putting it under cultivation. It did not seem quite so hopeless after I had seen a portion of "cleaned-up" battlefield—one which has been picked over for wire, shells, trench material, rifles and all the rest of the flotsam and jetsam of battle—but it was not until the day I met a Canadian officer, who (like myself) owned a Western ranch and had broken up new land with a tractor, that a practicable solution of the problem suggested itself.

"The danger from unexploded shells is practically negligible," said he, "for the simple reason that a detonator that has failed to go off at the end of a five-mile or ten-mile flight through the air is not likely to be greatly disturbed by a prod from a plough-share. Also, the explosive in a shell or hand-grenade tends to deteriorate very rapidly after burial in damp

earth. There need be no worry on that score. Neither will buried barb-wire give much trouble for any length of time. That which can be got hold of from the surface will be picked up long before the war is over, while that which is buried out of sight can be pulled up—or cut off far enough down to keep it from fouling the plough again—as fast as it is run into, which will not be for more than a year or two after regular cultivation is under way. Railroad iron, concrete fragments, corrugated steel roofing and other heavy trenching material will have to be picked up and carted off bodily.

The First Cultivation

"All of this leaves," he continued, "the discovery of a practicable way of effecting the first rough cultivation as the one great problem to be solved. Once the ploughs and harrows and drills are able to go over the ground the smoothing out process will go on automatically, for the simple reason that earth displaced in the ordinary routine of cultivation always tends to work downwards so as gradually to obliterate the hollows and humps. Indeed, it is astonishing how much is accomplished in this direction by the erosive action of the elements alone. Blown dust and rain-washed silt will deposit a foot of earth a year in the bottom of an ordinary shell-hole, and the great mine crater at Pozières must have decreased twenty or thirty feet in depth—due principally to the sluicing down of its sides in the torrential rains—in the fourteen months which have elapsed since it was made.

"Since irrigation is not practised to any extent in this part of France, it will not be necessary to reduce the land to any such a 'billiard-table' evenness—or even to establish 'contour' levels—as would be imperative if we had to do with South Africa or California. Given a first thorough 'going over'—one that will smooth the ground sufficiently to allow the use of the farmer's ordinary instruments of cultivation immediately afterwards—and the problem is solved for good and all; the land itself will produce all the heavier for its stirring up and three or four years' rest.

"The question then narrows down as to what sort of a machine will have to be devised to accomplish this preliminary work. I do not need to tell you that the ordinary type of side-wheel tractor would not progress its own length over an average stretch of 'crater ground,' nor that even the largest and most powerful 'caterpillar' would 'stall down' in the first big shell-hole and have to give up the game for good at the first unexcavated-in line of trench. Unless the millions of such obstacles are to be levelled by scrapers or steam-shovels—at a prohibitive cost—a machine will be needed which can pursue the even tenor of its way straight across them. And right there you have the answer to those who are asking what is to be done with the thousands of tanks that will be left without 'occupation' at the end of the war. Use them for tractors to draw specially-devised plows and harrows in the first rough cultivation of the 'crater areas.'

"The extent of the fought-over ground which is too torn up to be cultivated in the ordinary way can hardly run to more than a few hundred square miles at the outside, and ten times as many tanks will be available as would be necessary to give this a complete going over in a fortnight or so. There will also be an ample supply of trained drivers to run them, though the handling of a tank is something that any man who can run a tractor or motor lorry can pick up in a day or two. The nature and design of the implements to be drawn would have to be determined by experiment, but there is no reason why these should not be initiated at once, so that whatever types are determined on could be built and ready for use at the first opportunity. Indeed, assuming that the Germans are to be pushed still further back—or even held where they are—on the St. Quentin-Cambrai Front, there is no reason why the restoration of the 'crater' area of the Somme battlefield should not be taken up at any time."

He had not, this officer concluded, given any definite thought to the design of the implements to be used, but, offhand, he thought that the prime desiderata would be an ability to clear up as much buried debris as possible in the process of cultivation, and also to exercise as a maximum levelling effect. Great strength and—if any difficulty was experienced on this score—more or less invulnerability to subterranean explosions—would be *sine qua non*. Since this meeting, however, I have had the good fortune to spend an evening in his company while he was on leave in London, and the following tentative scheme for preparing the "crater" areas for cultivation by means of tanks was drawn up on that occasion.

The ground should be ready for the first "going over" just as it is left by the ordinary cleaning up work now being carried on, by which all of the solid materials of all kinds on the surface are picked up and carried away. The first implement to be used would be a harrow of enormous strength, the function of which would be to rake the earth to a depth of a foot and a half or two feet, dragging up any buried wire

or other debris likely to interfere with the later routine cultivation. For the sake of strength and "balance," it would best be made triangular in form, and built to tow from the apex by a fifteen or twenty-foot cable running to its tank. This, or even a greater length of cable, would be necessary to insure that both tank and harrow should not be in difficulties in the same hole at once. The teeth (made of two-inch steel bars) would be set at wide intervals—certainly not less than six inches apart—and provided (either by rows or individually) with levers that would slope them back in disentangling any debris raked up. A gang of two, or three men would be ample to work the harrow, but it would probably be found necessary to follow it with a tender and a gang of scavengers to dispose of the stuff it clawed up. It might be found practicable to fix a scraper on the rear end of the harrow, which would help in pushing down hummocks and filling hollows.

The size of an implement of this kind would have to be worked out after determining the resistance it offered with its teeth set at full length. It would also, of course, vary with the power of its towing tank. The amount of open work in its frame should make it more or less impervious to serious injury from explosions, but if it were found that these were

going to be frequent—which is highly improbable—it would doubtless prove advisable for its men to follow on foot or ride on the tank.

The effect of an implement of this kind—especially if equipped with the scraper—going over even the roughest area would be to reduce the largest shell-craters to rounded depressions, as well as to break down and largely to fill in even the deepest and widest trenches. One more "tank operation," however, would probably be required to smooth the ground sufficient for ordinary cultivation. This might take the form of towing a string of heavy tractor ploughs over the harrowed section. A series of foot-deep, eighteen-inches-wide furrows should come pretty near to disposing of any irregularities prominent enough to interfere with the operation of tractor or horse-drawn implements. If, however, there was still too much of a "ditch" where some of the trenches had been, this could be reduced by running the tank up one side and down the other, with its following ploughs throwing earth into the depression both ways. (I have often closed up storm-water "washes" on my California ranch by using a "caterpillar" tractor in a similar way). After that the roughest stretch of "crater land" should be in shape for the French peasant to resume business as usual.

"Hot Air"

By Centurion

"LET her go!" said the Lieutenant. She went. At one moment I had been looking into the faces of the men around the car; at the next I was looking down upon their heads and could study the parting of their hair—they had their caps off and were in their shirt-sleeves. Only a drag-rope now anchored us to earth and that rope was very taut; the balloon seemed to have suddenly developed a personality of her own and was obviously impatient to be off. I suddenly felt extraordinarily volatile; there seemed to be nothing under my feet and nothing there was except some basket-work barely an inch thick. I felt that I was made of india-rubber, and that I might bounce at any moment—which is a nasty sensation, for it makes you feel a wild desire to bounce over the side of the car and see what will happen to you. The Lieutenant cast off the rope. We rose with amazing rapidity; the earth rushed away from us; the white faces of the crowd looking up at us behind the fence lost all their individual features; the ecstatic shouts of the children died away. I suddenly felt very queer.

No! I didn't like this. I didn't like it at all. I have "proceeded"—in the Army you never "go" anywhere because that might imply you came to rest somewhere, and there is no rest in the British Army—to some objective or other in nearly every form of transport known to the two Services, and of all of them I liked this beastly toy the least. I have flown in a Maurice Farman in a 30-mile gale at six thousand feet and felt nothing but a surprising absence of feeling—except when the "bus" "bumped," or when she began to volplane down, and I felt as if I were descending a gigantic staircase with a rather long leap from one stair to the next and no banisters to hang on to. I have helped to steer a tank, looking after the brakes while the tank commander performed like an organist with his hands and feet, peering through the visor as though he were reading a piece of music, and have reflected that this too was very unsensational except at the moment when we came to a crater and our great leviathan paused irresolutely on the edge, as though she were afraid of it, until she made up her mind to it, after which all you feel is that it's uncommonly like flying with an occasional "bump." I have looked on in a submarine while it submerged in the disciplinary silence that is the rule on those occasions, and have stood by the coxswain as he worked the plane-controls and wondered, as I watched the tell-tale bubble and the pointer of the depth-gauge, why the submarine didn't make a little more fuss about it. A hunt for a submarine in a naval drifter when the wind began to freshen—yes! this was—this was uncommonly like that. It was distinctly sensational. There was the same feeling in the pit of my stomach. Was I going to—? I looked over the side of the car. No, it would be too disgraceful. Another outrage upon an inoffensive civilian population.

I looked up through the ring into the open neck of the balloon and saw to the very top of the yellow interior—it seemed uncommonly empty; I studied the diagonals of roping—the ropes seemed remarkably thin; I looked at the clothes-basket in which I and the other three stood—it was

desperately small. I looked over the side, which reached no higher than my waist, and hastily withdrew my gaze. I looked at the coil of rope and the bags of sand at our feet and thought I had better sit down. I looked at my three companions and I thought I had better not. For all three of them were sitting nonchalantly on the edge of the basket like performing monkeys on a trapeze, their arms embracing the stays overhead; one of them was swinging a long leg over the side.

"It's—it's—a fine day," I remarked, desperately.

"You'll feel better in a moment," said the Lieutenant pointedly. "It's the gas, you know. It always affects one a bit at first."

"I rather like gas," I said, insincerely. "But I don't like it quite so fresh from the meter."

"There's the river!" said the Lieutenant, whom I will call the pilot, for such he was. The other two, each wearing a single "pip" on their sleeves, were "learning the ropes"—more particularly the valve rope.

I began to sit up and take notice. I looked over the side. I saw quadrangles, polygons, circles, also buildings leaning back at various angles much as a house appears in a badly focussed photograph.

"What a city to bomb!" I said involuntarily.

"Yes, isn't it?" said the Lieutenant. "One always feels like that at first." So this was sensation Number Two.

"We did bomb her the other day," he resumed, "with sandbags. We'd got over Battersea and found ourselves suddenly coming down and likely to get a cold tub in the river. So I said 'Poop off some ballast' to a fellow who was learning the ropes. And before I knew what he was doing the silly fool had thrown out half a dozen bags—bodily. Of course, you should always shake out the contents slowly—like a sower going forth to sow. They landed like bombs bang on the skylight of a factory or workshop or something of the kind. I saw them go through. As we rose, I saw a crowd of people rushing out into the street like ants when you've kicked over an ant-heap. They must have thought it was a raid—broad daylight too. The last I saw of them was a fat man shaking his fist at us."

We rose to about 800 feet and, as we ascended, the several noises of London were merged into one diaphanous hum, but out of it certain individual sounds retained their identity. They were cab-whistles. The whole city seemed alive with them, and one could hear each and every one.

"The whistling for a cab, the barking of a dog, the crowing of a cock," said the pilot in a literary style faintly reminiscent of the Book of Proverbs, "these are the last sounds one ceases to hear."

As we travelled over the North of London a dark mist blotted out the great city, but the white trail of smoke from railway-engines showed through it clearly like streaks of cotton wool. It was raining below. The houses were invisible, but railway-tracks gleamed through the mist with a curious effect as though we were gazing at their reflection in water. My destructive mood returned; I felt that at that moment I longed of all things to drop a bomb on that railway track. Which suggests that there's something very impersonal about bombing a city. I think of all lethal enterprises aerial bombing must be the least demoralising to the character. You

don't think in terms of men but of targets, especially structural targets.

Thus meditating I took out my cigarette-case.

"Put it back, please," said the pilot hastily. "This isn't a smoking compartment." And he pointed overhead. There was nothing to see overhead except the delicate fabric of the balloon. And then I suddenly remembered that gas: I had no desire to go up to heaven—or down to earth—in a chariot of fire like the prophet. So I put it back.

"We haven't got any parachutes, you see," he explained apologetically. He spoke as though it were the most natural thing in the world to take a leap out of a balloon with a closed umbrella that might never open. "If anything went wrong we should be done."

This interlude provoked him to a most unfeeling strain of reminiscence: "When I was learning flying at the W—aerodrome—before I got my transfer to the Balloon Wing—there was a Russian chap, a learner. He went 'solo' and had a smash. They took up seven basketfuls. The difficulty was to bury him."

"Why not a sack?" I said. It sounds a callous conversation, but after all there's only one way of looking at it if you want to keep your nerve. You must laugh at it.

"Oh! I don't mean that. I mean the Burial Service, Rites of Holy Church and all that kind of thing. You see a Russian can't be properly buried without incense and no end of ritual. Well, they discovered a Russian priest in the uniform of a Canadian padre. At least he said he was. Perhaps he was anxious to oblige."

"But what about the incense?"

"I'm coming to that. Some bright youth said he'd look after that—which relieved the C.O. mightily as he was anxious to do the correct thing and impress the fellow-countrymen of the deceased. Very important to keep on good terms with Russia just then, you know! . . . There was a great turn-out. The padre chanted away like a gramophone—and a N.C.O. duly lighted the sacred fire. Everybody sniffed. 'There's something very familiar about that smell,' whispered the C.O. to me. 'Very familiar.' And he sniffed like a fox-terrier. 'I have it, sir,' I said, 'it's tobacco.' And so it was. The N.C.O. had also contributed some packets of woodbines—like the widow's mite—which was rather decent of him when you come to think of it. And before the padre had finished I heard the sergeant say in a stentorian voice—'Collect the empties.'"

"It sounds a bit blasphemous," I remarked.

"Well, anyhow it was a good brand," said the pilot piously. "It was John Cotton."

The air seemed fresher. I looked at the aneroid; we had risen to 3,000 feet. The little red bubble in the statoscope, looking like a drop of coagulated blood or what the bacteriologists call a "smear," which alternately solidified and liquified, was crawling to the right—a sure sign that we were still ascending. Periodically one of the learners shook out the contents of a sandbag which descended like pepper. We had a steady S.E. wind behind us, and we made out our course by observation of the roads and railways, checking them off on our map with the aid of a compass. The mist had cleared and I saw that we had left the city far behind us. We passed over woods and forests, their tops looking like a bed of asparagus; we sailed over growing crops of cereals, still green (it was early August), resembling, after the heavy storms, nothing so much as a cushion of green plush all rubbed the wrong way. "Barley," said the pilot. "And that's corn"; he pointed to a beaten field; I seemed to be looking down at a rough plaster-cast in yellow clay. From far below us came a continuous hum and a large beetle appeared to be racing along the road at a tremendous speed.

"A motor-cyclist," said the pilot. Again I felt that lethal instinct. To aim a bomb at a rapidly moving target—"short!" "over!" "hit!" Undeniably there was a sporting element in it.

"We're beating him," said the pilot. Yet our motion was imperceptible. We seemed to hang in the ether like a lonely planet.

We picked out one feature after another with the aid of our map. It was like doing a puzzle. Aerial observation has a fascination of its own. Introduce an element of "camouflage" into it, such as a screened battery, and you're back at the old nursery game of "Puzzle, Find the Woodman." There is much to be said for an aerial life. It's clean, which is more than you can say of the trenches, and invigorating. And if you get "knocked out"—well, it's all over in no time.

"It's about tea-time," said the pilot, and he pulled a rope. I wondered if it was to summon the waiter. Then he let go. There was a loud clap.

"The valve," he explained. It may have been, but more of that later on. A shower of tiny chalk-like crystals descended on us from the interior of the balloon, as though some chemical change was going on up there. Sometimes the valve-rope

catches. Then you climb up inside the ring. At least you do if you can think of nothing better. Personally, I would rather not.

He pulled again at intervals, and one of the others paid out some 300 feet of drag-rope. As we descended, the rope touched the ground, and I watched the deep furrow it made in the grass—the aftermath of a hayfield. There was something uncanny about that rope. As we crossed a park of elms, having thrown out ballast to clear it, the rope rose from the ground, jumped the park fence, climbed the trees, and followed us across their fan-like tops like an animated thing. An enormous serpent seemed to be following us with diabolical persistency, hissing as it brushed the trees. We passed a gabled manor-house with tall chimneys and having cleared the park threw out the grapnel. By this time the smooth full cheek of the balloon was beginning to crinkle and pucker like a rubicund countenance that has suddenly been stricken with senile decay. The pilot pulled the "rip" rope, opening a panel to the top of the balloon, and we came down with a bump.

We bounced, bumped, and bounced yet again. I found my head and shoulders caught in a snare of collapsing tackle with the balloon heaving like a wounded bird above us.

"Will you take tea or coffee, sir?"

I looked up, like a mouse caught in a trap, and I found myself staring into the face of a housemaid in cap and ribbons who was peering over the car in a state of wide-eyed excitement.

"I think we'll get out first," I said, struggling like Samson with seven green withes. I was not yet feeling quite terrestrial and I had a vague idea that the waiter had answered the bell.

"Her ladyship saw you coming over the park," said the housemaid, by way of explanation. "And she sent me out and said, she said, 'If they're not Germans, ask them if they'll have tea or coffee? But if they're Germans, send for the police at once.'"

"Be they Germans or bain't they?" I heard a masculine voice behind the housemaid. "Because if they be—"

"Put that gun down, you silly old ass," shouted the pilot, with his head in a noose. "What the hell do you damned well mean by —"

They be English all right, Jarge," said another voice reassuringly. "Cassn't thee tell by the way they talk? That's good educated English."

"Aye, 'tis Jacob, depend on it, 'tis. No German Hun could talk such beautiful English, I'll take my gospel oath on it. The gentleman hev' a very proper gift of speaking."

A number of heads seemed suddenly to appear from nowhere in a circle around us. An aged man, holding a gun, looked over the side of the basket as though he were inspecting pigs in a netted cart.

"Beg your pardon, gentlemen," he said, in a tone in which he strove manfully to conceal his disappointment.

"Don't mention it," said our pilot, politely, as we extricated ourselves and clambered out of the basket. "Got a horse and cart anywhere? Good. You men, there, you can help us flatten her out. No, no, like this. Start at each end and roll her up."

They all set to, kneading the collapsed balloon as they squeezed the gas out of her billowy folds.

"It do just seem like holding down a pig at killing-time," said one of them pensively. "What a girl chitterling it be!"

"It's the way mother makes dough," whispered one child to another, as she stood round looking at us with a finger in her mouth. The men rolled the fabric over and over, crushing the pink clover and sulphur-coloured toad-flax beneath it. In a few minutes our ballon was packed up in a green canvas hold-all little bigger than a kit-bag, to the no small astonishment of those who had witnessed her descent. Canvas bag and basket were hoisted into the cart with directions to drive to H—, the nearest railway station, some six miles away.

"Thank you, madam, we'll take tea," said our pilot as we entered the house.

"I'm afraid it's a little strong," she said, graciously. "It's been waiting some time for you."

I remembered that the pilot had pulled a mysterious rope about "tea-time."

I'm not in the R.F.C. But I hear that their methods of aerial communication are very wonderful.

Copies of "The British Firing Line Portfolio" containing a series of Engravings in Colour by Captain Handley-Read and forming a wonderful record of the Battle-area, may be obtained, price 5 guineas each, from the Leicester Galleries, Leicester Square, W.

On Minding Our Own Business

By Principal L. P. Jacks

ANY person who dares, in these days, to say a good word for minding one's own business will find himself exposed to various forms of obloquy. His neighbours will conclude in general that he is a selfish man. If he ventures his plea in public, somebody will charge him with being an advocate of *laissez-faire*, and the inference will be drawn that he is not only indifferent to the sufferings of his fellow men, but thoroughly idle. It will also be hinted that he regards himself as a superior person, and mental pictures of him will be evolved in which he will be represented as bidding the whole world go to the devil. Nobody will believe that he is a good citizen or a patriot.

The best citizen, the best patriot I ever knew, was a man whose life was fiercely devoted to the principle of minding his own business. I have never met a man more industrious, more unselfish, more trustworthy. He had thirteen children, who grew up into stalwart, sober, intelligent and self-respecting men and women; every one contributing necessary service to the world at this moment; three in the army, two in the navy, the rest doing skilled work in munition factories or tilling the land. The man himself was a shepherd, and his regular wages were eighteen shillings a week. He bred the finest rams in England. But for him the mutton on our tables to-day would be poorer in quality and less in quantity. I wish I could think that I had contributed to the life of the community anything a quarter as valuable. To be sure he never talked either about citizenship or patriotism; but he did the thing the rest of us would talk about. He neither interfered with other people, nor would he allow them to interfere with him. Because he wanted to mind his own business, that of breeding sheep, he insisted on being left alone. And he left others alone, thus doing unto them precisely as he would they should do unto him. Taken on his own terms, he was agreeable enough and interesting beyond measure. He was excellent company, and deeply religious. But if you interfered with him, especially if you showed the least desire to improve him or do him good, he would turn his back and walk away in wrath.

If all men were like him it would be impossible for anybody to do good to anybody else—except, of course, in secret, which is the way the Bible says it ought to be done. But in that case—if everybody minded his own business as this shepherd did—doing them good in ways that were not secret would be unnecessary. The reason we have to do so much good in public, to pass so many public laws, and to make so many public speeches, is always, in the last resort, that somebody is not minding his own business. It is a rather humiliating state of things and suggests that life moves in a vicious circle. Smith causes trouble by not minding his own business; then Jones has to neglect his in order to set right the trouble caused by Smith; and then Robinson has to leave his counter in order to straighten things up in Jones's shop—and so it goes on. Hence it is that our morals, politics, and social reforms have much in them to remind us of the process by which the men of Gotham earned their livelihood—they took in one another's washing. It is clear that if everybody would wash his own clothes there would be a general *saute qui peut* among the moralists, politicians and social reformers. Their occupation would be almost gone, and they would be reduced to the necessity of having to do good in secret, which some of them would find most uncongenial to their habits.

I believe good citizenship, patriotism, and, indeed, Christianity itself, were not well served when "doing good to others" became the war-cry of moralists. These moralists meant well, but they did harm. Just because they meant so well we have been half-blind to the harm they did and are still doing. What they meant to do, of course, was to promote good works all round, in which no doubt they have succeeded—to some extent. But, incidentally, they caused a new division of classes—that, namely, between the people who fancy it their mission to do good, and the "others" to whom good is done. Without intending it, they set up a small aristocracy, which called itself "we," and at the same time they created (in imagination) an enormous moral proletariat known as "others." This has had the effect of opening a door, for any man who wants to neglect his own business, through which he can press the claim that he is one of the "others" whose business ought to be minded for them by somebody else. That, in the miserable days before the war, was the attitude of the public—the artificially created proletariat—towards the Government. "You," said the public, addressing the Government, "represent the moral aristocracy, who mind other people's business. Behold us, then, who are the 'others' in question. Do us good. Mind our business—for we are disinclined to mind it ourselves. Educate our children,

Regulate our wages. Insure us against poverty. Fix prices. Compel us to behave ourselves decently. Put policemen at every street corner."

It is not wholesome for any man to think of himself as one of the "we" who do good to others; he is apt to become a Pharisee without knowing it. Nor is it better for him, but worse, if he think of himself as one of the "others" to whom good is done; he will almost certainly fall into the habit of neglecting his own business, especially if it happens to be difficult. Most of us, it will be found, unconsciously place ourselves in one or other of these two classes. Or rather, we transfer ourselves from the first to the second and *vice versa*, according to the convenience of the moment. If the business we are engaged in is pleasant and costs nothing—such as public agitation, speech-making, devising schemes of social reconstruction—the tendency is to place ourselves among the "we" who go about doing good. If it is unpleasant, or arduous, or requires abstinence, care, forethought and self-sacrifice—such as properly educating our children or protecting ourselves from poverty in old age—our tendency is to let the business drift and wait till the State steps in and takes it off our hands: we now belong to the "others" to whom good is done.

A Curious Process

You may see this curious process actively at work in the discussions that are now going on about Education. The assumption on which it proceeds is that there exists in the community a comparatively small class of persons ("we") whose part is to educate, and an enormous multitude of persons ("the others") whose part is to be educated in the manner which "we" consider best. Every one who has a scheme to propose unconsciously reckons himself a member of the small aristocracy represented by the first class; rarely indeed, do you encounter an educational reformer who shows the faintest suspicion of his own need to be educated. On the other hand, the great mass of the public is so accustomed to be treated in this way that it doesn't bother its head about education at all. It leaves the whole business, which is really its own, to be looked after by "we;" though it is not unlikely that when "we" have made their arrangements the public will discover that they have been most unwarrantably interfered with, and will kick ferociously against the arrangements "we" have made.

That, I contend, is bad for both parties

As happens so often, the moralists, with their cry of "do good to others," have got hold of the stick, but they have grasped it by the wrong end. The most effectual way of doing good to others is to mind your own business—the most effectual, but the least showy, for there is nothing in it to indicate to the passers-by that you are a philanthropist. Your conduct will commend itself only to those who prefer to see good done in secret. Assuredly, there is no form of "social service" comparable to that which one can render by doing his job to the very best of his ability. And, contrariwise, the true enemies of society are those who scamp their jobs, no matter whether the cause be idleness, stupidity, selfishness or the benevolent desire to spend one's time in looking after the interests of other people. This applies to everybody, from the Prime Minister to the hodman. No education is worth a straw that is founded on any other principle.

One often wonders what the world would be like at the present moment if civilisation had been grounded from the first on the law of "mind your own business," with less said about doing good to others. I cannot but believe that we should be living in a far better world. There would be less idleness, less inefficiency, less ugliness, less dirt, less shoddy, and, above all, less humbug—less, in short, of everything which darkens the future of the earth. The curse of bad work—the root of the labour problem—would never have lighted on our civilisation. There might not be so much wealth in the world, but what there was would be worth far more. We should be doing each other more good than we can ever hope to do by all that is commonly comprised under "social service." We should entertain a higher respect for our neighbours; for there is nothing that makes you despise a man so completely as the sight of him scamping his job. We should be more united, more sociable, more unselfish, and more willing to pull together. And the present war would never have taken place. What is wrong with Germany is simply that she has never learnt to mind her own business and to leave other nations to mind theirs. She claims the right to impose her culture on the rest of the world without consulting it, which is precisely what our educational reformers do when they take

the "uneducated masses" in hand. In fact Prussian militarism merely carries out on the international scale, and to its logical conclusion, the mistake we all commit when we grasp the principle of doing good to others by the wrong end.

I contend therefore that the obloquy is misplaced which the fashion of the day turns on the man who believes in minding his own business. The obloquy falls on the opposite party. Our believer is not an idle person; he works longer hours than his opponent, and produces a better article. He is not indifferent to the welfare of others; he does them good in secret all day long. He is not a superior person who bids the whole world go to the devil; he sees it going to the devil under the influence of the opposite principle and tries to save it by sticking to his post. He is not a selfish man; he is the true philanthropist, though he never seeks the reputation of being one,

and greatly dislikes hearing himself called by that name. He doesn't practice *laissez-faire*; he leaves that to the people who neglect their own business under the pretext of doing good to others. He is not a troublesome member of the community; he gives less trouble than anybody else, and at the same time performs more social service than anybody else. His job is not the easiest; it is the hardest, but he makes no fuss about it and seldom complains. Taking him all round he is the best of good fellows—staunch, neighbourly, cheerful, healthy-minded, unpretentious—a pillar of society in every sense of the term, an excellent citizen and a true patriot. To be sure, he is a trifle disagreeable when he finds himself in the midst of talking men, especially if they are talking about social service; but, otherwise, you will find him the most pleasant of companions, and be very glad you have him alongside of you in the world.

Comrades of the Great War

By a Comrade

WE can look back through the brooding cloud of three years of war, to the beginnings of our army of to-day—the little handful at which a powerful enemy laughed then, boasting like the giant Harapha—and his jest is immortal and our glory. Small as it then was, it was grouped and divided with an intimate difference from the millions now massed on all our battle fronts. In the old days before 1914, "The Regiment" was all-in-all to the soldier. It had the best of him, and he was part of it; it got into his very bones.

Short service altered that; and the sudden outbreak of war and the country's unprepared state and urgent need, brought in a different state of things, different types of men in all ranks. The recruits in the first army of 1914 were mostly small boys when we were fighting at Spion Kop. They had no regimental traditions, and they did not learn many, for everything was under new emergency conditions, and carried through—crammed and hustled through if you like—against time, and in the rush old names, old prestige and sentiment, seemed minor matters. For the first time in the memories of living men the country was in danger. And England became all at once an upstanding reality to Englishmen.

Every sailor and soldier, behind his more immediate pride in his own craft or his own company, his particular R.F.A. Battery, or armed trawler, has that dominant idea, we believe; he is fighting for his country. No bond holds closer than suffering and danger shared for the sake of a common faith. The ordeal of war has so knit together the men of our forces that they mean to keep their war-time fellowship through the coming years of peace. "The Comrades of the Great War" is a league founded for and founded by old sailors and soldiers, on equal terms, for intercourse, for mutual help, and for keeping in mind the great lessons of patriotism learned in these rugged days; for raising a living memorial—the noblest we can—to the brave who have given their lives for home and for honour.

Victory will bring peace, and peace demobilisation. For a short time the five million or so of discharged men will be publicly regarded as heroes. They will be no less heroes when we have been at peace for five years. But nobody supposes that the tumult and the shouting will go on all that time. The disbanded forces will be just so many millions in our population, dispersed and absorbed. Their life will become the hum-drum round of working citizens, just the same as if they had never taken a trench or sunk an enemy destroyer; a daily-bread affair, rush times and slack seasons, shop disputes, Bank Holidays, the wife and children, the bus chock-full on a rainy morning, and all the rest of it.

"The rest of it" will be fairly complicated too! Relations between the discharged men and those who have not served with the colours, for good and sufficient reasons, and (often against the grain) had to carry on at home! Relations between employers and employees, between Government officials and the men whose affairs they deal with and regulate; between men and women in the labour market. Altogether a coil of problems.

In this dispersal and turmoil, this interweaving and clashing of claims and interests, it is the purpose of the "Comrades of the Great War" to stand for a national ideal. It is the first association of men of all ranks meeting and co-operating with the good of the country as a whole for their great objective. The league has an economic side, a special bearing on the interests of the discharged sailor and soldier; but though every local centre will be an actively functioning organiser working for their benefit, it is not established only for material and economic purposes. Every Division, Branch and post will be a social club: there will be friendly and family inter-

course, amusement and interest and good cheer. Do these homely humanities belittle and weaken a strong public spirit? We know better. On these ultimate plain things the great societies of mankind stand fast.

The fellowship is, as its charter says, a strong and democratic constitution. There is no preference for the commissioned over the non-commissioned officer, "no class, rank, or party" is recognised, stoker and commander may sit side by side on the Executive. Privates and N.C.O.'s are holding many official posts of importance and responsibility, especially as organisers in provincial centres; and they form about one half of the numbers of the General Committee.

We may sketch here some of the society's activities on the practical side. Employment and Pension Bureaux are already in working order in connection with the National Headquarters in London, and it is intended that this will be extended to every division and important branch, at all events, throughout the country. The Government Pensions machinery is largely—is bound to be—for sorting and sifting purposes, rejection of bogus claims and much necessary work of a similar kind. And the claiming of legitimate dues in form often involves—again inevitably—much paper formality; and there are endless small personal difficulties, urgencies, peculiarities, that special and personal help can more adequately meet. Then there is the training of the discharged men in new moves of activity. There are, too, a little farther on in the future, schemes of industrial enterprise.

As the league gets on a firm footing, it is intended to affiliate similar societies formed or forming among the ex-Service men of the Overseas Dominions. Who are our Comrades if not they? And, further, centres will be established in foreign countries whence British residents have come to fight under the flag. So that wherever the returned soldier goes home he will find a foothold of fellowship and recognition.

A word here specially as to one section of the "Comrades" honourably distinguished. No man can surely have come back as he went—these tremendous experiences must have seared brain and nerve and left unseen traces on the strongest; but some have paid heavily indeed "for valour." Every wounded man knows his own hardship best, and none, I think one can say, make any complaint.

Now their fighting days are over they ought to feel that they can be of some use. Life, especially to a man badly damaged, is of little value without that. He may be made as comfortable as circumstances will permit, may even be in luxury and have his path smoothed for him by every kindness and consideration; but if he has to feel that he is a drag and a burden and a bore, he will be sorry he was not finished off altogether. But the wounded Comrade has a great place and purpose in the league. More than any other man he can keep his fellows in mind of that supreme sacrifice of the individual that is sometimes for the common good.

The Comrades will make that common good, that national well-being their principle of outlook and action. They risked death for their country—and they will risk living for her. They know this war will have been won in vain if men relapse into a base tooth-and-nail scramble of self-interest. The rights of "The Comrades" have to be studied, their claims adjusted, in connection, in a reasonable proportion, with those of all others. They are to be a band of brothers, but not such a devoted family (one has known families like that) as to be shocking bad neighbours to everyone else. Let them use their brains and their wills, let them bring to all problems of national life the generous spirit, the good will, patience, and indomitable resolution that kept them unbroken in the field; and they will rout many a bullying injustice, and make impregnable the strong white heights of peace.

Life and Letters

By J. C. Squire

British Printing

IN the summer of 1914 I was in Germany. Having handed those plans to the Kaiser and received those bags of gold from Bethmann—for it is just as well to confirm at once the suspicions that my first sentence will have aroused—I left Berlin and went to Leipzig. At Leipzig there was being held an Exhibition of Printing and the Graphic Arts, and thither on my first morning I bent my steps. In one respect the Exhibition was like all other exhibitions; having been open for several months it was only half ready. Even German efficiency, apparently, breaks down when faced with the problem of exhibitions: some of the buildings were not yet completed and the roads were morasses. It was a very large concern; almost every State in the world had its pavilion and its official representative. Each building was in the style of the nation occupying it; the English exhibits, for example, were displayed in a charming low Tudor house. Siam had a little box, and, for all I know, specimens of Thibetan art were to be seen in a miniature lamassery. I spent the whole day there: finishing up, I remember, with a meal in the company of two stray Englishmen who talked of what was the burning question of the day, the prospects of the British polo team in America.

* * * * *

One thing that struck the English visitor at once was the popularity of the Exhibition. Had one attempted such a show here I imagine that we should have held it in the Agricultural Hall, that it would have been generally attended by members of the printing trade on the look-out for economical devices, and that the principal exhibits would have been enormous machines capable of turning out millions of *Daily Mails* in an hour. But the German Exhibition was deliberately made as popular as possible; the public were expected to come to it just as though it were Earl's Court or the Zoo. All over the place were touches of what the controversialists call "the old Germany of Beethoven, Goethe and Kant." There were beer saloons in plenty; there was a life-size reproduction, not of a Zulu village, but of Old Heidelberg, including that venerable vault where is kept the largest Barrel in the world, and a students' museum containing notable specimens of the equipment with which German undergraduates contrive to improve each other's faces. There were great halls where bands of Bavarian peasants, in knee-breeches and jaunty feathered hats, discoursed the music of their highlands, whilst the audience drank beers and stuffed itself with black bread and little gherkins. There were flags in masses and booths with freaks in them and galleries where one could shoot at models of beasts and men. It was all so very unlike a really serious English industrial exhibition.

* * * * *

But unhappily, the most noticeable and the most humiliating thing of all was the hopeless inferiority of the British as compared with the foreign and especially the German exhibitions. In the department of drawings we held our own. But the show in our printing pavilion was simply miserable. In gallery after gallery the German publishers showed thousands of beautifully printed and produced books ranging from the expensive edition *de luxe* on vellum to the tasteful penny series. All that we could show to equal or surpass their best were a few examples of the Kelmscott and other private presses. Most of the English publishers who had taken cases seemed to be totally unaware what printing was. They had apparently mistaken the Exhibition for a book-shop, and had sent specimens of all their dreary publications apparently in the hope that British or American tourists would buy a few copies. They even, some of them, showed rows of unreadable theological books bound in that sort of horrible navy blue or sage green cover, which emits a dim shriek when one runs one's finger nail across it. I admit that the Germans, when they lay themselves out to produce an unprepossessing book, can leave us standing; they could even—though it may be hard to believe—surpass that pamphlet entitled *Murder Most Foul*, which somebody in authority seems to imagine is produced as the English people would like it. But the Germans are doing an immense amount of very creditable commercial printing, and we are not.

* * * * *

These memories of the forgotten and shady past were reawakened this week when I received a copy of what is intended to be the first volume of a new edition of Shelley—*The Lyrical Poems and Translations of P. B. Shelley*, edited by C. H. Herford (Chatto and Windus, 15s. net). This book—printed at the Florence Press—is a most beautiful book, and, like the

productions of the Riccardi Press, and our unexcelled private presses, shows once more how well we can do if we care. But the price of the volume is fifteen shillings, and I do not suppose it could have been economically done for less. And this is almost invariably the case in this country; if one sees a well-printed book it is almost sure to be expensively bound, and printed on costly paper, so that its price puts it out of the reach of the big public. The chances also are that its contents will be—well, Shelley, or *Marius the Epicurean*, or something else which is considered "worthy" of good print. It costs no more to print from a good fount of type than from a hideous one. It costs no more—once one has spent a little time thinking about design—to print a well-arranged title page than it does to print one, the type and spacing of which are left to chance or evil custom. But in this country we seem to be tied by two obsessions: one, that only the rich deserve to have really nice things, and the other, that it is indecent to "waste" good design upon something which has a vulgar use. Just as we think—or act as if we thought—that churches should be beautiful, but that workmen's cottages are not worth bothering about, so we will refuse to allow our taste to enter into the production of an ephemeral or popular work merely because it is not the *Faerie Queene*. Our lowest depths are plumbed with our technical works. "Business is Business," one can hear their producers reflecting, and they are probably afraid that if they take any pains to make their books look pleasant they will be mistaken for diletantti or quacks. The last irony is that some of the ugliest books of the last generation have dealt with what their authors and publishers, in mechanical respect for tradition, were content to describe as the Art of Printing.

* * * * *

All this would not be worth writing if printers and publishers only were going to read it. They are, in England, a sluggish and unimaginative crowd; and, as long as they can market bad goods, not the eloquence of a Demosthenes would persuade them to produce good ones. But the important thing is to overcome the apathy of the consumer, the reading person who has a liking for a pretty book, but does not allow his own tastes to influence his purchases sufficiently or bother to make his views known to his bookseller. Even authors usually allow their publishers to get their works up in styles which make them writhe rather than insist on having a voice in the matter themselves. I recommend Professor Herford's Shelley to those who can afford it, and I am glad to have it myself. But when it has gone on the shelf it will cause its owner more pain than delight because of the abominable-looking trash by which it will inevitably be surrounded.

A Sailor's Garland

BY N. M. F. CORBETT.

O I will weave a garland,
A garland for my Sweet,
Of clouds of sunset splendour;
Of wavelets' murmur tender;
Of music of the Summer stars that dance on silver feet
Across the floor of Heav'n.
Of solemn hush of even;
Of Twilight's shy surrender
Her Lord the Night to greet.

A garland of the glamour
Of Ocean's tameless flood;
Of sea-bird's wings a-quiver;
Of moonlit sails a-shiver;
(Green fire-flakes at the forefoot and the mast-caps silver
shod),
And through the pattern running
Shall twist in fashion cunning,
O! like a golden river,
The sea-taught Peace of God.

O! I will weave a garland
But not of fading flow'rs,
I'll weave it of the swinging
Deep bosomed surges, flinging
Their diamonded, salt spray drops in rainbow-tinted show'rs,
I'll weave it of the thunder,
The glory and the wonder,
The Sea is ever singing
To hearts that love like ours.

Books of the Week

Hawk of the Desert. By G. E. MITTON. John Murray. 5s. net.

Thomas. By H. B. CRESSWELL. Nisbet and Co. 5s. net.

Merely Players. By LUCY DALE and G. M. FAULDING. T. Fisher Unwin. 6s.

Miss Mary. By KATHARINE TYNAN. John Murray. 5s. net.

Revoke. By W. DE VEER. John Lane. 6s.

THERE is no living writer who can tell a story of adventure to the greater delight and entrancement of young people than Miss G. E. Mitton. She always takes her audience with her to strange places; on this occasion to the innermost parts of the Egyptian desert, and *Hawk of the Desert*—a splendid title—bears you on his wing in one wild rush from the first chapter to the last. The characters are forcibly drawn; the German spy and intriguer, Thies, is a masterpiece, the way he pulls the strings and finally meets his reward are among the great excitements. Miss Mitton always scores by having gained first-hand knowledge of the wild regions which she describes; no one could have written this book with the same effect who had not been to Upper Egypt. There are occasions, so it seems to us, when she dilates a little too fully on local facts and peculiarities, but these pages we venture to think will be easily skipped by the young person who is out for blood and not for information. This is certainly one of the few really good adventure books that have been produced this-Christmas.

Mr. H. B. Cresswell, author of *Thomas*, has designed his book with a view to amusing his readers, and leaving the task of instructing them to those who believe that "heavy" fiction is acceptable in war time. Thomas was a civil servant who went on a holiday, and juggled with time so as to extend a month into six weeks, or thereabouts; he left at home a rather masterful sort of mother and a very charming young relative by marriage, both very well drawn figures in the story. By means of a small motor car, certain fish, a duke, and a few other equally varied accessories, Mr. Cresswell has contrived as merry a story as has appeared for some time. One makes friends with Thomas even while laughing at him, and eventually one laughs with him, up to the last chapter, where the author proves that he is capable of writing stirring prose; not without a touch of sentiment, as well as comedy. Thomas is a very welcome acquaintance all round, one in whose company it is quite possible to forget the war for an hour or two, and be genuinely amused.

It would be interesting to know how much of *Merely Players* is due to each of its two authors, Lucy Dale and G. M. Faulding, for there is in the book no sign of collaboration, no variation of style from which one might conclude a dual authorship. It is the well-written story of two women and two men—one man married the wrong woman, so that the other man and woman were left out in the cold. In pre-war days, such a situation would probably have led the author or authors to take the characters on to such complications as would have involved the banning of the book by libraries, but there is at this present time a higher conception of life, and, very wisely, these folk are made to act in such a way that the most captious reader could not blame either Judith, the woman who counts, or Denis, the man who realises his mistake too late. It is a well-told story.

In the matter of plot, Mr. E. F. Benson's latest book, *An Autumn Sowing*, is little more than a short story; Keeling, head of a provincial establishment paralleling Whiteley's, who began life in a small fish shop, took unto himself a secretary when he reached the age of fifty and found in that the romance of his life; mainly through the strength of the girl both he and she loved honour most—and there the book ends with Keeling realising that work is all which can compensate for the loss of the girl and the presence of his wife. In this, as far as plot is concerned, is no more than material for a short story, for the concurrent story of Alice, Keeling's daughter, and Silverdale, the parson with high church habits and a "pawing" manner where the womenfolk of his flock are concerned, is quite unimportant.

But, though the plot is so small, the treatment is otherwise. With uncanny skill Mr. Benson has stated the difference

between Keeling, honourable, even admirable, and the well-bred folk with whom his work brings him in contact; with equal insight is pictured the boring stupidity of Keeling's wife, her utter inability to rise with her husband from the fish-shop level. Norah Propert, the heroine, is more shadowy; Silverdale, the offensive parson, is a caricature, though in him one recognises an all too common type, while Alice, born to spinsterhood and a prey to waste emotions, is little more than commonplace. The author has centred his activities in Keeling, and in him has created a figure worthy of more than casual attention, one of the best types that modern commercial life evolves. The book is more than clever, for the skill with which the very slight relations between Norah Propert and Keeling are traced from their beginning to the inevitable end is worthy of a larger epithet. Mr. Benson has done no better work than this, which is totally distinct in manner as in construction, from any other book he has written.

Pleasure is to be gained from such a story as *Miss Mary* Katherine Tynan's latest novel. (John Murray, 5s. net.) It is a simple relation of Irish life, with an exceedingly conventional plot. Miss Mary is the daughter of an Irish landlord, and the hero is a boy who, although of good family, enters the story as a stable boy—and the end is the usual end to such a story. But there is keen insight into Irish folk and Irish life, and certain anecdotes scattered about are more than normally attractive. For instance, the young doctor, very raw, who, when confronted with finger-bowls for the first time, ladled strawberries into his, remarking that it was wonderful how well up in "hygeen" we had become, as nothing wanted washing more than strawberries. Whereupon his host's strawberries went into his finger-bowl, as did those of the rest of the guests, while at the end the company agreed that strawberries were best unwashed after all. "Washing spoils them—we're too faddy about things nowadays," was the general conclusion. It is not the anecdote itself, but the way in which it is told by Miss Tynan and the spirit which it and others like it convey, that make the book a healthy, breezy novel, well written and very entertaining.

The slightest of stories makes up *Revoke*, by W. de Veer, for it is the setting rather than the actual story that counts in this novel. Onno Winter, president of the native court at a Javanese provincial centre, met a charming English girl, and lost his head over her—but she, after certain hesitations, preferred to keep her head, and that is practically all. The only pretence at an incident in the book consists in a snake-bite for the girl, when Winter virtually saved her life, but not much emphasis is laid on this, for the author is too much concerned with the course of the passion animating these two, a futile passion in the end.

But, apart from the story, the life and scenery of Java are pictured with a sure hand, so that one may realise the tropical heat of the coastal settlements, and the wonderful scenery of the uplands. A certain journey that Winter took with the girl and her father to a hill station yields us acquaintance with the wonders of the little-known road, with the rest houses, and with the manners and the laziness of the Javanese people, yet all this is painted in such a way as to fit with the story. It is obviously the work of one who is intimately acquainted with the country he describes, and, by the time the conscientious reader reaches the end of the book, that reader will feel that he too knows Java. Winter is a cleverly-drawn character, but the heroine is even more elusive and contradictory than the majority of women. Without any attempt at scaling dramatic heights, the author has told a story well fitted to its scene, and thus has made, out of the material for a short story, a very attractive novel.

Dr. Newell Dwight Hillis, one of America's leading ministers of religion, made a personal investigation of the battlefields of France and Belgium in order to enquire carefully into the truth of German atrocities. On his return to America he made a number of public addresses, and preached an eloquent sermon at Plymouth Church, Brooklyn, a pulpit famous in America in that it was occupied for many years by Henry Ward Beecher. This sermon was printed and published widely in the United States, and it is now being circulated by Messrs. W. H. Smith and Son in this country. It is entitled *Murder Most Foul*, and contains in concise form facts and particulars about German atrocities which are based on indisputable evidence.

Literature in War Time

By James Milne

"Give us the Book that flowers and flames,
With love and youth and noble tears."

THAT is the book, new or old, on which the war, with its ordeal of simple living and high thinking, has made the greatest demand. People, in these tragic but heroic days, look to books for resolution and comforting. They turn to them alike in moments of uplifting and moments of heart-breaking, as to tried friends who will survive the furnace. So the book of discomfort, the book of undue curiosity which we knew so well before the war; in fine, the book concentrated in the "problem novel," has practically disappeared amid the fires of the war.

If literature be true and great, it is life also, or, it may be, death; and that is seen in the relationship of the new books which succeed, to the conditions of this long, searching war. There has been a shedding of what was fleshly—did not Robert Buchanan once speak of the "fleshy school of fiction"?—in current literature, and a growth of what is spiritual. That note has been constantly ascending as the tumult has gone forward, and it is very noticeable during the past publishing season. You did not meet the frivolous, trifling book as often as before, the book of which you say, "Whence comest thou and why"? You did not see it because, like the Spanish fleet of the ballad, it is not in sight. When Armageddon broke it looked as if the pen were to be broken by the sword; certainly the pen of the average author, historian, novelist, essayist or poet. But gradually that shadow cleared, as it was bound to clear, when the true business of the written literary word is considered. The situation, therefore, is that the pen never played such a great part in a war; only its influence has turned new books into certain main channels. Some, like the "problem novel" it has thrown aside; others, like biography, it has stimulated, perhaps on the principle, "lives of great men, they remind us, we can make our lives sublime."

These are simple words, homely like much of Longfellow, but it is the simple things, the common touches of nature, that are settling the big things at this epoch of history-making. We are too near the events and personalities of the conflict to see them fully; to understand them as they will be unveiled by history. The mountain darkens, but the past is an open book which we can consult, and in what better way can this be done than through the pages of a biography? You may if you are a good reader by nature and habit, have set yourself a particular course of reading as a war distraction. You are sure to have one or two friends who have done so. Biography is pretty certain to come into that reading, old biographies the backbone, with worthy new ones that arise. Beside biographies, of course, one marshals autobiographies, which, as old lights in new editions, or as new lights given to us, are equally in demand, not alone with the good reader, but with the other fellow, the general reader.

The truth is, we are living a page of the world's history when fact is stranger, far stranger, than fiction. Run over the bare titles of books gathered out of the fighting line, in recent months, and you will be convinced. The soldier writer, first of the Old Army, then of the New Army, has achieved wonders in prose. He has done so because he has written simply of what he has met in warfare, given us plain tales from the hills of Flanders, from the scarred rocks of Gallipoli, from the scorched sands of Mesopotamia, or from the yellow lagoons of East Africa. The soldier writer has written from his fullness of feeling and hazard, and therefore he has written lasting things. They are all jumbled up as yet, in the heap of what we easily call "war books," but the day will arrive for their sorting out, and fine will be the array. The British infantryman is not only making history, but he is recording its making with a nearness which you may feel on the shelves of any London library or book shop.

You may, in those same quarters, hear what may surprise you a little, that the essay, the long neglected essay, has come up again on the tempest of the war. Perhaps the initial stimulus to that is traceable to a few prose war books like Donald Hankey's *Student in Arms*, and Charles Lister's letters. There you have the thoughtful temperament in action for supreme stakes. That temperament senses it all, groups it all, gives it all to us in a form which it finds natural, the essay. Serious minds have welcomed it and bereaved hearts have found it a solace, for just so, perhaps, were the thoughts of some one, near and dear, who did not write. A similar emotion leads to the volumes we have had on life and death, the here and the hereafter, the possibility, however unstable, that those who have gone gloriously "over the top" in the war, never to return, physically, may, in soul, survive in another bourne.

Christmas Morning, 1915

By An Eye Witness

IT may live, this episode, as lives yet the legend of the French and British soldiers' fraternising over that common stream and washing-place in the Peninsula. The grey, early Christmas morning; grey sky, and grey world of the trenches. The winter mist lingering here and there, moist and vapoury, making everything look big. The frost still clinging to the ground. And the two long, irregular lines of trenches facing each other.

The drab landscape of which every feature, every rise or fall in the ground, every knoll, every hideous skeleton of shattered buildings, almost every tree, had its story. They were consecrated for ever to the memory of the English race. The Aubers Ridge opposite—that very inconsiderable, scarcely noticeable rise in the ground—was consecrated to the memory of Englishmen. So were the very ordinary-looking trees and hedgerows and fields that fringed its summit, that climbed its slope. So were the bright-red and dark-red roofs of buildings that clustered half-way up the slope and the tall factory chimney in their midst. They were Aubers itself.

A short distance to the left was a village—absolutely sheltered. You could just see its brown roofs, its stark walls, and vari-coloured ruins, amid the trees. There was the church—a ghostly shell dominating the flat scene. It marked Gough's Corner. And immediately behind the trenches at a distance of about 200 paces, there was a row of tall elms and poplars, looking monstrous in the mist. They marked the line of the road. Immediately in front of them was a big farmstead with its courtyard and square little home-field—an untidy heap of red bricks amid four naked walls.

Between the long irregular lines of trenches, with their jumbled white sandbags and their untidy earth parapets, was a stream marked by a line of twisted brown willows bent to every conceivable grotesque shape. It ran down the middle of No Man's Land. It was a place of coarse grasses hiding little mouldering heaps of grey and khaki (heaps of old clothes or fallen scarecrows, they looked like), of knobs and unexpected pits, of earthly holes and water-logged ditches. Here British and Germans met.

As soon as it grew light that Christmas morning, they started peeping at each other over the top of the parapet... calling across to each other. And away there on the right the Boche stood up openly on his parapet and waved his arms. And then they came out all down the line, stood up on the parapet, waved, shouted, and finally swarmed out of their trenches on either side.

A British sergeant had been shot dead almost at the outset, as he stood on the parapet. But this made no difference. It must have been an accident. The supreme craving of humanity, the irresistible, spontaneous impulse born of a common faith and a common fear, fully triumphed.

And so the grey and khaki figures surged towards each other as one man. They met at the willow-lined stream; they even crossed it and mingled together in a haphazard throng. They talked and gesticulated, and shook hands over and over again. They patted each other on the shoulder and laughed like schoolboys, and leapt across the little stream for fun. And when an Englishman fell in and a Boche helped him out there was a shout of laughter that echoed back to the trenches. They exchanged cigars and pieces of sausages, and sauerkraut and concentrated coffee for cigarettes and bully-beef and ration-biscuits and tobacco. They expressed mutual admiration by pointing and signs. It was our leather waistcoats and trench-coats that attracted their attention; it was their trench-overalls, made of coarse canvas, that attracted ours. Even confidences were exchanged in broken English!

"What sort of billets have you?"

"Rotten!"

"Aren't you sick of the war? We are!"

"Not a bit of it. We shall fight for years yet."

And the information was even vouchsafed that the Christmas Eve bombardment had caused the Germans a lot of casualties.

So for ten brief—all too brief—minutes there was peace and good will among the trenches that Christmas Day.

Then two officers came out, and they were for taking photographs of the Tommies, offering them cigars. And presently they said:—"You will have five minutes to get back to your trenches before our artillery will open fire."

And it did. And two or three men were wounded almost at once. But for twenty-four hours not a shot was fired on either side. A common brotherhood of suffering—or was it an act of God or just human curiosity?—had united Englishman and Bavarian, on the battlefield one grey Christmas morning which no one on either side who had taken part in that quaint scene will ever forget.

Where the Public Schools Fail

By S. P. B. Mais

THE late Headmaster of Eton, writing in *The Contemporary Review* on that much discussed book *The Loom of Youth*, makes the interesting statement that "whatever is wrong with our public schools is the outcome of certain defects of the English character: a general improvement in them is inconceivable unless there is first a general improvement in Society," adding as a corollary, that, "masters, like the boys, are the product of English homes, and most of them have had to acquire a sort of interest in some intellectual subject in face of the steady discouragement of an irresponsible home circle."

If this statement be true, it follows that until we can educate the general public to take an interest in intellectual matters, there is no hope for reform in the schools, and we are once again condemned to fly round in our vicious circle content to turn out a type of boy physically fit, honourable, according to his lights, a good companion and an excellent leader of others, but mentally obtuse, both ignorant and indifferent to any of the intricate problems relating to modern conditions, which are likely not only to tax the capacities of the cleverest and most patriotic citizens in the solution, but will require distinctly brilliant brains in every section of the community before any attempt at such solution can be feasible. I think, however, that Dr. Lyttelton is wrong in his premises. It is not, as he says, that society imposes its standard upon the schools, but rather the schools which set the standard for society. How else, I would ask, is society to be educated? Even now the average adult does not despise culture, nor is he ready to run at the mention of poetry, music or painting, as he was ten years ago. Why? Because the aesthetic standards at school are higher than they were in 1907. Not that they are satisfactory even now, but the boy certainly has done much to educate the parent.

My theory is that the failure of the public schools is due to society only, in so far as society has still to learn that cheap goods are the most expensive in the end. The average man has realised that if he stints his children in food he will not only ruin their health, but incidentally have to pay considerably more on doctors than he would have had to spend originally on nourishment. What he has still to learn is that if he stints his children in mental food, he will not only impair their intellectual and moral digestion, but will probably have to continue to contribute towards their upkeep for a far longer period than he would have done had he invested more at the beginning on the best possible education. How can he understand this unless he is taught? Who so fit to teach him, through his son, as the schoolmaster? In a word, the root of the educational evil, in common with the root of most evils, is poverty. For who are ultimately responsible for education in this country? The schoolmasters.

Youth's Associates

On them depends the whole burden: they are the only grown up people with whom the bulk of the youth of the nation come into hourly and daily contact for the greater part of that period in life when they are most amenable to discipline, initiative of example, and malleable in character. It follows, then, that their whole view in life is going to be coloured by the attitude which they adopt at school, whether towards religion, morals, mental or bodily powers. It would seem as a consequence, that of all professions in the state that of teaching would stand as the most honourable, that only the best men would be allowed to enter its ranks, and that the qualities required, high moral integrity, absolute sincerity and singleness of aim, indefatigable energy and a fine intellect ever reaching out for fresh realms to conquer, combined with an inexhaustible sympathy, would justify those who were elected to so responsible a calling in demanding a very high salary.

Such would appear to be the logical conclusion if my argument is sound. Instead of which, what do we find?

With the cost of living increased enormously, the schoolmaster still receives the quite inadequate wage he had before the war. No man of brilliant capabilities can be expected to give of his best in exchange for a salary lower than that of a plumber. If you really want the best man you have to bait your hook to catch him. A third-rate wage only means that you will succeed in getting the third-rate intellect. That is where the public schools fail. The masters cannot be expected to teach, as Mr. Fisher has well said, unless they are happy; no honest man can be happy if he is continually harassed by debt. The average schoolmaster to-day simply cannot afford to live on what he gets from his work; he has to undertake outside examining, give public lectures, try his hand at jour-

alism, turn his house into a sort of private hotel, go round from house to house in the holidays, when he ought to be resting, coaching backward boys for examinations; in a word, he has to turn his hand to all sorts of unnecessary labours in order to remain in the ranks of the profession he adores. In the light of this the astonishing thing is, not that there are so many inefficient schoolmasters, but that there are so few. Ten per cent. is a quite generous estimate of those who are consistently "ragged" and fail to teach boys anything. On the other hand, not more than ten per cent. are really capable of making boys realise that they come to school primarily to develop their brain power, to learn how to learn, how to think, and the (to them) strange fact that knowledge is power. So we arrive at the lamentable truth that eighty out of every hundred schoolmasters are not only martyrs to a cause, but useless martyrs to a forlorn cause.

Where Money Comes In

When they left the University these men were certainly full of promise. They did not represent the cream of their society, it is true; the Civil Service, the Bar, Science and Politics may, perhaps, be said to have claimed all those who seemed likely to make a stir in the world, but the second layer, who shared the Church, Medicine and Education, were by no means dull. Furthermore, they were willing for the sake of an ideal to forego honour and riches. Unfortunately they represented a type which is more likely to be led than to lead; existing beliefs, existing institutions and traditions become too much for them; after the briefest of struggles they follow the line of least resistance, and we see the lamentable result in curates deliberately shutting out the light of reason in order to be comfortable in their half-beliefs; doctors in fair circumstances settling down in the country to perpetrate outworn "cures," and, worst of all, schoolmasters enmeshed in the snare of that pernicious tradition, which is still rampant in our schools, that the training of the intellect comes last, and very much least, among the myriad interests of boyhood.

Every spare hour of a schoolmaster's life is spent in coaching games, which are still taken with a desperate seriousness out of all proportion to their importance, or in performing one of the thousand duties involved in the Officers' Training Corps. I am not pretending that these two side-issues of public school life ought not to usurp all our *superfluous* energy; what I do maintain is they should come second to, not before, the actual class work. At present it is well-nigh impossible to make boys realise that it is as important, from the point of view of their usefulness to the State, to reach a standard of efficiency in actual work as it is to keep their bodies healthy and to acquire the rudiments of military training.

The position in a nutshell is because the masters are underpaid the boys are underfed mentally. If we wish, as a nation, to utilise all our resources, to get the last ounce out of each individual citizen, we must go to the fountain head of all the present waste and confusion, and demand better education. It will not be cheap, but will be worth paying for. I do not pretend that the result of enticing the flower of the brains of this country to enter the teaching profession will mean that we shall get more Balliol Scholarships in the future, even though that is an end which is by no means despicable in itself. It will mean that we shall produce an average type of a more stable kind than hitherto, stable in the sense of having interests outside the domain of sports, able to employ its leisure not in vacuous, insipid pleasure, crudely mistaken for happiness, nor in undertakings of doubtful morality, entered upon owing to lack of both imagination and depth of character.

For it is a fact all too little recognised that poverty of intellect is the prime cause of poverty of morals. Training of the mind no less than training of the body results in avoiding excesses of any sort. Studies, as Bacon told us, serve for delight, ornament, and ability. Not only so, but they serve as an indispensable guide to life, a very present help in time of trouble, and are of distinctly marketable value, none of which things has even yet been sufficiently realised by the general public, for the simple reason that but few people have hitherto pinned their faith to them or turned them to account.

Our paramount duty is to find and encourage the right type of schoolmaster, to find him by offering him a tempting salary, to encourage him by giving him leisure to develop on his own lines, and to keep abreast of modern thought and discovery. Once this is done the public schools will no longer fail, in spite of attacks made upon them, either by pupils like the author of *The Loom of Youth*, or headmasters like Dr. Lyttelton.
